ENCYCLOPÆDIA BRITANNICA.

P R U—P R U

PRUDENTIUS, AURELIUS CLEMENS, a Christian verse-writer, apparently a native of Spain, who flourished during the latter half of the 4th century and in the beginning of the 5th. According to the meagre and vague autobiographical notices given by himself in the preface to his poems he was born in the year 348, and, after receiving a liberal education, practised at the bar and subsequently held judicial office in two important cities. At the time of the publication of his poems in 405 he held from the emperor a high military appointment at court. Of his subsequent history nothing is known.

His extant works, besides the preface already referred to and an epilogue, are the following:—(1) *Cathemerinon Liber*, a series of twelve hymns (*καθημερινὸν ὕμνων*) in various metres to be repeated or sung at particular periods of the day or seasons of the year; (2) *Apotheosis*, a poem of 1085 hexameter verses on the divinity of Christ; (3) *Hamartigenia* (967 hexameter verses) on the origin of evil and sin; (4) *Psychomachia*, or the conflict between virtue and vice for the soul (915 hexameter verses); (5) *Contra Symmachum*, two books, of 658 and 1131 hexameter verses respectively, directed against the petition of Symmachus to the emperor for the restoration of the altar and statue of Victory which Gratian had cast down; (6) *Peristephanon Liber*, fourteen poems in various metres, in honour of certain saints who had won the crown of martyrdom (hence the name, *περί στεφάνων*),—these, which are often vigorous and graphic, are generally considered to show Prudentius at his best; (7) *Diptychon* or *Ditochæon*, a series of forty-nine hexameter tetrastichs on various events and characters mentioned in Scripture. The *editio princeps* appeared at Deventer in 1472; among modern editions may be named those of Faustus Arevalus (2 vols., Rome, 1788-89), Olbarius (Tübingen, 1845), and Dressel (Leipsic, 1860).

PRUD'HON, PIERRE (1758-1823), French painter, born at Cluny on the 4th of April 1758, was the third son of a mason. The monks of the abbey undertook his education. The paintings which decorated the monastery excited his emulation, and by the aid of Moreau, bishop of Mâcon, he was placed with Devosges, director of the art school at Dijon. In 1778 Prud'hon went to Paris armed with a letter to Wille, the celebrated engraver, and three years later he obtained the triennial prize of the states of Burgundy, which enabled him to go to Rome, where he became intimate with Canova. He returned to Paris in 1787, and led for some time a precarious existence, painting portraits and making designs for booksellers. The illustrations which he executed for the *Daphnis and Chloë* published by Didot brought him into notice, and his reputation was extended by the success of his decorations

in the Hôtel de Landry (now Rothschild), his ceiling painting of Truth and Wisdom for Versailles (Louvre), and of Diana and Jupiter for the Gallery of Antiquities in the Louvre. In 1808 he exhibited *Crime* pursued by Vengeance and Justice (Louvre, engraved by Royer), which had been commissioned for the assize courts, and *Psyche* carried off by Zephyrs (engraved by Massard). These two remarkable compositions brought Prud'hon the Legion of Honour; his merit was widely recognized; he received innumerable orders, and in 1816 entered the Institute. Easy as to fortune, and consoled for the misery of his marriage by the devoted care of his excellent and charming pupil, Mademoiselle Mayer, Prud'hon's situation seemed enviable; but Mademoiselle Mayer's tragical suicide on 26th May 1821 brought ruin to his home, and two years later (16th February 1823) Prud'hon followed her to the grave. The classic revival which set in towards the close of the 18th century, and of which Louis David was the academic chief, found in Prud'hon an interpreter whose gifts of grace and naiveté tempered by seriousness atoned by the personal charm which they imparted to all he did for the want of severity and correctness in his execution. Mademoiselle Mayer (1778-1821) was his ablest pupil. Her Abandoned Mother and Happy Mother are in the Louvre.

Voïart, *Notice historique de la vie et œuvres de P. Prud'hon*; *Arch. de l'art français*; Qu. de Quincy, *Discours prononcé sur la tombe de Prud'hon*, *Rev. 1823*; Eugène Delacroix, *Rev. des Deux Mondes*, 1846; Charles Blanc, *Hist. des peintres français*.

PRUSSIA (Ger., *Preussen*; Lat., *Borussia*), a kingdom Plate I. of northern Europe and by far the most important member of the German empire, occupies almost the whole of northern Germany, between 5° 52' and 22° 53' E. long. and 49° 7' and 55° 53' N. lat. It now forms a tolerably compact mass of territory, with its longest axis from south-west to north-east; but within the limits just indicated lie the "enclaves" Oldenburg, Mecklenburg, Brunswick, and other small German states, while beyond them it possesses Hohenzollern, in the south of Württemberg, and other "exclaves" of minor importance. On the N. Prussia is bounded by the North Sea, Denmark, and the Baltic; on the E. by Russia and Poland; on the S. by Austrian Silesia, Moravia, Bohemia, Saxony, the Thuringian states, Bavaria, Hesse-Darmstadt, the Rhenish Palatinate, and Lorraine; and on the W. by Luxemburg, Belgium, and

the Netherlands. With the exception of the sea on the north and the mountain-barrier on the south-east, the frontiers are political rather than geographical, a fact that has always been characteristic of Prussia's limits and that has had considerable influence in determining its history. The Prussian monarchy, with an area of 134,490 square miles, comprises nearly two-thirds of the entire extent of the German empire. Its kernel is the Mark of Brandenburg, round which the rest of the state has been built up gradually, not without costly and exhausting wars. The territory ruled over by the first Hohenzollern elector (1415-40) did not exceed 11,400 square miles, an area that had been quadrupled before the death of the first king in 1713. Frederick the Great left behind him a realm of 75,000 square miles, and the following two monarchs, by their Polish and Westphalian acquisitions, brought it to a size not far short of its present extent (122,000 square miles in 1803). After the disastrous war of 1806 Prussia shrank to something smaller than the kingdom of Frederick the Great (61,000 square miles), and the readjustment of Europe in 1815 still left it short by 14,000 square miles of its extent in 1803. Fully one-fifth of its present area is due to the war of 1866, which added Hanover, Hesse-Cassel, Hesse-Nassau, Schleswig-Holstein, and the city of Frankfort-on-the-Main to the Prussian dominions.

HISTORY.

The claims which Prussian history makes upon our attention are based neither upon venerable antiquity nor upon uniformity of origin. The territorial and political development of the country has taken place wholly within the last thousand years; and the materials out of which it has been built up—marquisates and duchies, ecclesiastical principalities and free imperial cities—are of the most heterogeneous description. The history of Prussia acquires its primary significance from the fact that this state was the instrument by which the political regeneration of Germany was ultimately effected from within, and the unity and coherence of the narrative are best observed when we consider it as a record of the training that fitted the country for this task. This rôle was forced upon Prussia rather by the exigencies of its geographical position than by its title to be racially the most representative German state. The people who have established the power of Germany cannot rank in purity of Teutonic blood with the inhabitants of the central, western, and southern parts of the empire. The conquest of the Slavonic regions that form so great a part of modern Prussia did not occur without a considerable intermingling of race, and Prussia may perhaps be added to the list of great nations that seem to owe their pre-eminence to the happy blending of their composite parts. It is perhaps also worthy of remark that this state, like its great rival, was developed from a marchland of the German empire,—Prussia arising from the North Mark erected against the Wends, and Austria from the East Mark erected against the Hungarians.

In tracing the early development of Prussia three main currents have to be noticed, even in a short sketch like the present, which do not completely unite until the beginning of the 17th century; indeed many writers begin the history of modern Prussia with the accession of the Great Elector in 1640. We have (1) the history of the Mark of Brandenburg, the true political kernel of the modern state; (2) the history of the district of Preussen or Prussia, which gave name and regal title to the monarchy; and (3) the history of the family of Hohenzollern, from which sprang the line of vigorous rulers who practically determined the fortunes of the country.

Mark of Brandenburg.—Whether Teutons or Slavs were the earlier inhabitants of the district extending from the

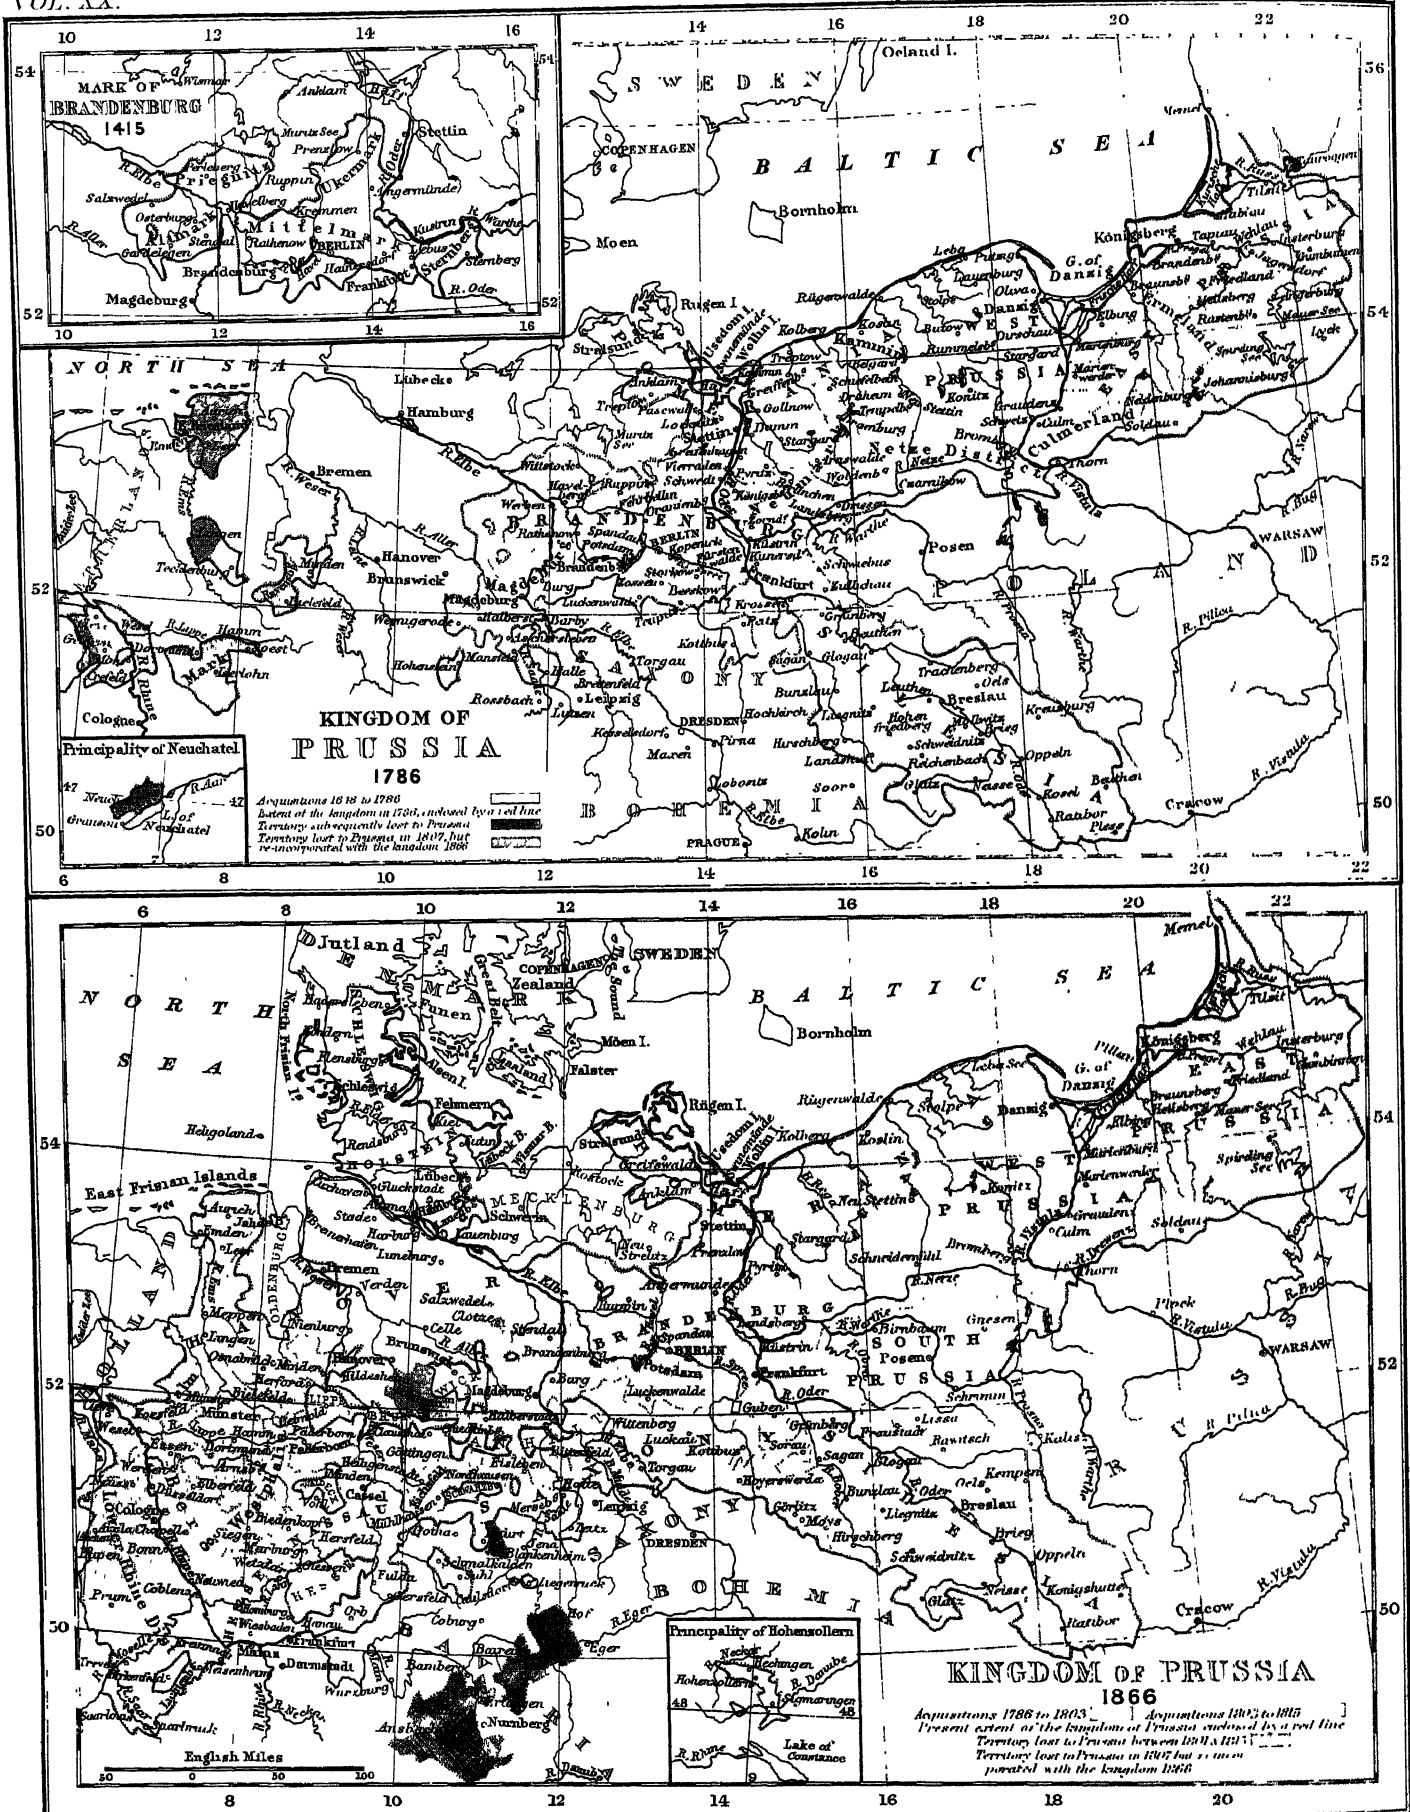

Elbe on the west to the Oder and the Vistula on the east is a question mainly of antiquarian interest and one upon which authorities are not wholly agreed. In the opening centuries of the Christian era we find it occupied by Slavonic tribes, whose boundaries reach even to the west of the Elbe, and the conquest and absorption of these by the growing German power form the subject of the early history of Brandenburg. Hand in hand with the territorial extension of the Germans went the spread of Christianity, which, indeed, often preceded the arms of the conquering race. The Slavs to the east of the Elbe were left unmolested down to the foundation of the German monarchy, established by the successors of Charlemagne about the middle of the 9th century. Then ensued the period of formation of the German "marks" or marches, which served at once as bulwarks against the encroachments of external enemies and as nuclei of further conquest. The North Mark of Saxony, corresponding roughly to the northern part of the present province of Saxony, to the west of the Elbe, was established by the emperor Henry I. about the year 930, and formed the beginning of the Prussian state. The same energetic monarch extended his career of conquest considerably to the east of the Elbe, obtaining more or less firm possession of Priegnitz, Ruppín, and the district round the sources of the Havel, and even carried his arms to the banks of the Oder. His son Otho I. (936-973) followed in his father's footsteps and founded the bishoprics of Havelberg and Brandenburg, the latter taking its name from the important Wendish fortress of Bran-nibor. Towards the end of the 10th century, however, the Wendish flood again swept over the whole territory to the east of the Elbe, and the Germans were confined to the original limits of the North Mark. Christianity was rooted out and the bishop of Brandenburg reduced to an *episcopus in partibus*. The history of the next century and a half is simply a record of a series of desultory struggles between the margraves of the North Mark and the encompassing Wends, in which the Germans did no more than hold their own on the left bank of the Elbe.

Things begin to grow a little clearer in 1134, when the emperor Lothair rewarded the services of Albert the Bear, a member of the house of Anhalt and one of the most powerful princes of the empire, by investing him with the North Mark. Albert seems to have been a man of great vigour and considerable administrative talent, and by a mixture of hard fighting and skilful policy he extended his power over the long-lost territories of Priegnitz, Ruppín, the Havelland, and the Zauche. He also shifted the centre of power to the marshy district last-mentioned and changed his title to margrave of Brandenburg. The North Mark henceforth began to be known as the Altmark, or Old Mark, while the territory round Brandenburg was for a short time called the New Mark, but more permanently the Mittelmark, or Middle Mark. The soil of Albert's new possessions was for the most part poor and unpromising, but he peopled it with industrious colonists from Holland and elsewhere, and began that system of painstaking husbandry and drainage which has gradually converted the sandy plains and marshes of Brandenburg into agricultural land of comparative fertility. The clergy were among his most able assistants in reclaiming waste land and spreading cultivation, and through them Christianity was firmly established among the conquered and Germanized Slavs. Albert's descendants, generally known as the Ascanian line from the Latinized form of the name of their ancestral castle of Aschersleben, ruled in Brandenburg for nearly two hundred years; but none of them seem to have been on a par with him in energy or ability. On the whole, however, they were able to continue in the course marked out by him, and, in spite of the pernicious practice

of dividing the territory among the various scions of the reigning house, the Mark grew steadily in size and importance. Before the end of the 12th century the margrave was created arch-chamberlain of the German empire, an office that eventually brought in its train the privilege of belonging to the electoral college. Berlin became a fortified post of the margraves in 1240 and soon began to take the place of Brandenburg as the political centre of the margraviate. Under Waldemar, who succeeded in 1309, the scattered possessions of the house were again gathered into one hand. His sway extended over the Altmark; Priegnitz, or the Vormark; the Middle Mark, now extending to the Oder; the lands of Krossen and Sternberg beyond the Oder; the Uckermark, to the north; Upper and Lower Lusatia; and part of Pomerania, with a feudal superiority over the rest. No other German prince of the time had a more extensive territory or one less exposed to imperial interference.

With Waldemar's death in 1319 the Ascanian line became extinct and a period of anarchy began, which lasted for a century and brought the once flourishing country to the verge of annihilation. Its neighbours took advantage of its masterless condition to help themselves to the outlying portions of its territory, and its resources were further wasted by intestine conflicts. In 1320 the emperor Louis the Bavarian took possession of the Mark as a lapsed fief, and conferred it upon his son Louis, at that time a mere child. But this connexion with the imperial house proved more of a curse than of a blessing: the younger Louis turned out a very incompetent ruler, and Brandenburg became involved in the evils brought upon the Bavarian house by its conflict with the pope. To crown all, a pretender to the name of Waldemar appeared, whose claims to Brandenburg were supported by the new emperor, Charles IV.; and in 1351 Louis, wearied of his profitless sovereignty, resigned the margraviate to his brothers, Louis the Roman and Otho. The first of these died in 1365, and Otho soon became embroiled with Charles IV. But he was no match for the astute emperor, who invaded the Mark, and finally compelled the margrave to resign his territory for a sum of ready money and the promise of an annuity. The ambition of Charles was directed towards the establishment of a great east German monarchy, embracing Bohemia, Moravia, Silesia, Lusatia, and Brandenburg, and he had the sagacity to recognize the commercial importance of the last-named as offering an outlet by the Baltic Sea. Charles, however, died in 1378, and with him perished his far-reaching plans. He was succeeded in the electorate of Brandenburg—for as such it had been formally recognized in the Golden Bull of 1356—by his second son Sigismund. This prince was too greatly hampered by his other schemes to bestow much attention on Brandenburg, and in 1388 his pecuniary embarrassments were so great that he gave the electorate in pawn to his cousin Jobst or Jodocus of Moravia. The unfortunate country seemed now to have reached the lowest point consistent with its further independent existence. Jobst looked upon it merely as a source of income and made little or no attempt at government. Internal order completely disappeared, and the nobles made war on each other or plundered the more peaceful citizens without let or hindrance. Powerful neighbours again took the opportunity of appropriating such parts of Brandenburg as lay most convenient to their own borders, and the final dissolution of the electorate seemed imminent. Jobst died in 1411; and Sigismund, who succeeded to the imperial throne mainly through the help of Frederick VI., burgrave of Nuremberg, conferred the electorate of Brandenburg on this stout supporter, partly in gratitude for services rendered and partly as a mortgage for money advanced. Sigismund also may possibly have recognized in Frederick the fitting

ruler to checkmate any attempt on the part of the Polish-Lithuanian power, which had just overthrown the Teutonic Order (see p. 6), to push forward the Slavonic settlements to their old frontier on the Elbe. At first Frederick was merely appointed administrator of Brandenburg; but in 1415 he was declared the actual feudal superior of the land, and two years later formally installed as elector.

The Brandenburg to which Frederick succeeded was considerably smaller than it had been in the best days of the Ascanians, consisting merely of the Altmark, Priegnitz, the Mittelmark, part of the Uckermark, and the territory of Sternberg. Including his family possessions of Ansbach and Baireuth, he ruled over a territory of about 11,400 square miles in extent. The internal condition of Brandenburg had declined as much as its territorial extension had decreased. The central power had become weakened and the whole inner organization relaxed, while the electorate had also lost most of the advantages that once favourably distinguished it from other imperial fiefs. Under the first margraves the official side of their position had been prominent, and it was not forgotten that technically they were little more than the representatives of the emperor. In the 13th century this feeling began to disappear, and Brandenburg enjoyed an independent importance and carried out an independent policy in a way not paralleled in any other German mark. The emperor was still, of course, the suzerain of the country, but his relations with it had so little influence on the course of its development that they may be practically ignored. Within the Mark the power of the margraves was at first almost unlimited. This arose in part from the fact that few great nobles had followed Albert the Bear in his crusade against the Wends, and that consequently there were few large feudal manors or lordships with their crowds of dependent vassals. The great bulk of the knights, the towns, and the rural communities held their lands and derived their rights directly from the margraves, who thus stood in more or less immediate contact with all classes of their subjects. The towns and villages were generally laid out by contractors (*locatores*), not necessarily of noble birth, who were installed as hereditary chief magistrates of the community and received numerous encouragements to reclaim waste lands. This mode of colonization was especially favourable to the peasantry, who seem in Brandenburg to have retained the disposal of their persons and property at a time when villinage or serfdom was the ordinary state of their class in feudal Europe. The dues paid by these contractors in return for their concessions formed the principal revenue of the margraves. As the expenses of the latter increased, chiefly in consequence of the calls of war, lavish donations to the clergy, and the attempt to maintain court establishments for all the members of the reigning house, they were frequently driven to pawn these dues for sums of ready money. This gave the knights or barons an opportunity to buy out the village magistrates and replace them with creatures of their own; and the axe was laid at the root of the freedom of the peasants when Louis the Bavarian formally recognized the patrimonial or manorial jurisdiction of the noblesse. Henceforth the power of the nobles steadily increased at the expense of the peasants, who were gradually reduced to a state of feudal servitude. Instead of communicating directly with the margrave through his burgraves and vogts (bailiffs), the village communities came to be represented solely by the knights who had obtained feudal possession of their lands. Many of the towns followed in their wake. Others were enabled to maintain their independence, and also made use of the pecuniary needs of the margraves, until many of them practically became municipal republics. Their strength, however, was perhaps more usefully shown in their ability

graves.

to resist the barons, which saved industry and commerce from extinction at a time of unbridled lawlessness, when the central power could do nothing for their aid. In the pecuniary embarrassments of the margraves also originated the power of the Stände, or estates, consisting of the noblesse, the clergy, and the towns. The first recorded instance of a diet co-operating with the ruler occurs in 1170, and in 1280 we find the margraves solemnly binding themselves not to raise a "bede" or special voluntary contribution (like the English "benevolence") without the consent of their estates. By 1355 the estates had secured the appointment of a permanent councillor, without whose concurrence the decrees of the margraves were invalid. In the century that followed the extinction of the Ascanians liberty degenerated into licence, and the land was given over to an almost total anarchy. Only the most powerful towns were able to maintain their independence, and many of them and of the clergy paid regular black-mail to the nearest nobles. Thus rotten within, it is no wonder that the electorate completely lost its independent political importance.

The
Hohen-
zollerns.

The Hohenzollerns.—The new ruler who had to face this state of affairs was a member of an old Swabian family, which took its name of Hohenzollern from the ancestral castle in the Swabian Alb. Recent investigation has traced back the line to Hunfrid, duke of Rhætia and Istria at the beginning of the 9th century, a member of the widely-spread family of the Burkardings, while it finds the actual progenitors of the Swabian branch of the family in two Alemannian dukes of the 10th century. At a later period the Hohenzollerns were conspicuous for their loyal services to the Hohenstauffen emperors, under whom they acquired extensive possessions in Franconia and Moravia, and also the office of burgrave of Nuremberg (1191). They were ultimately recognized as among the most powerful princes of the empire, and, though they never attained to the electoral dignity, they frequently exercised considerable influence in the transference of the imperial crown. Rudolf of Hapsburg owed his succession in 1273 to the exertions of one Hohenzollern burgrave, and Louis the Bavarian owed the victory of Mühldorf (1322) to another. The two sons of the first burgrave, Conrad and Frederick, divided their inheritance between them, the former retaining the Franconian estates and the dignity of burgrave, the latter the ancestral possessions in Swabia. From the first of these descended the rulers of Prussia, while the other line also still exists in the person of the mediatized prince of Hohenzollern-Sigmaringen.

Elector
Freder-
ick I.

Frederick (1415-1440), who as elector of Brandenburg assumed the style of Frederick I., showed himself equal to the troublesome task before him, and would have been still more successful had his interests been limited to the electorate. By a prudent mixture of lenity and firmness, which did not shrink from actual fighting, he controlled the lawlessness of the Quitzows and other robber barons, restored a fair degree of internal order, and made his subjects feel that the central power was a fact that could not be ignored. While thus regulating the affairs of Brandenburg, Frederick was also a conspicuous figure in imperial politics, especially in the Hussite wars. His candidature for the imperial throne in 1438 may be regarded as the first occasion on which the houses of Hohenzollern and Hapsburg came into competition. Frederick was succeeded in Brandenburg by his son Frederick II. (1440-1470), and in his Franconian possessions by his son Albert. The former followed in his father's footsteps by taking energetic measures to consolidate his power and restore the electorate to its former extent. His chief struggle was with the large towns, which had cordially welcomed the Hohenzollerns as champions against the freebooting barons, but were unwilling

Freder-
ick II.

to allow any intervention in their own affairs. Frederick subdued the resistance of Berlin, among other towns, and by a somewhat unwarrantable stretch of his prerogative erected a royal castle within its walls. He also regained possession of the Neumark, which had been given in pledge to the Teutonic Order in 1402, and would have added Lusatia and Pomerania to his domains if the emperor had not placed obstacles in his way. A long-standing feud with the archbishop of Magdeburg was also finally settled in this reign. Under his brother and successor Albert (1470-1486), surnamed "Achilles" from his chivalrous valour and military talent, the Franconian lands were again united with Brandenburg. Albert allowed his devotion to the emperor to interfere to some extent with his own interests, but he carried on successful wars with Mecklenburg and Pomerania, and effectually resisted the attempts of the Teutonic knights to repossess themselves of the Neumark. His name is best remembered by the *Dispositio Achillea*, a family ordinance providing for the future separation of Brandenburg and Ansbach-Baireuth, and establishing the custom of primogeniture in each. According to Hallam, this was the first instance of the legal establishment of primogeniture, and, when we consider the effect it had in keeping the Brandenburg possessions together, while those of Saxony (for instance) were frittered away among younger sons and their descendants, we shall not fail to discern its importance in determining Prussia's future. With the accession of John (1486-1499), John surnamed "Cicero" on account of his eloquence or of his knowledge of Latin, begins a short period in which the rulers of Brandenburg take little share in imperial politics. At home John found his hands full in repressing the disorders that had arisen through Albert's long absence from the electorate, and he acted with such vigour and address that he succeeded in obtaining from the towns an important excise on beer, frequently refused to his father. The old claim to feudal supremacy over Pomerania, dating from the days of the Ascanians, was compromised in 1493 for an assurance of eventual succession on the extinction of the Pomeranian dukes. The next elector, Joachim I. (1499-1535), acquired the surname of "Nestor" from his encouragement of learning, which he showed *inter alia* by the foundation of a university at Frankfort-on-the-Oder. He also effected an important internal reform by the introduction of Roman law, looking upon this as an easier way of securing uniformity of procedure than by a codification of the heterogeneous common law of his dominions. The inconvenience arising from the fact that the supreme court followed the sovereign from place to place was now removed in Brandenburg, as a short time before in England, by the establishment of a fixed and central court of final jurisdiction (*Kammergericht*). This court had its seat at Berlin, which had recently become the capital and residence of the electors. In curbing the lawlessness of the nobles, who were yet far from being perfectly disciplined, Joachim showed as strong a hand as his predecessors. He adhered strenuously to his Roman Catholic belief in spite of the fact that Protestantism had been embraced by his own family and by most of his subjects, and he regarded with abhorrence the attitude of the Protestant princes towards the emperor. In violation of the family law, Joachim I. bequeathed the Neumark to his younger son John, and thus Joachim II. (1535-1571) succeeded to only a part of the paternal possessions. John seems to have been the more vigorous and decided of the two brothers, and led the way in announcing his transition to the Protestant faith, followed by Joachim in 1539. John also joined the Schmalkald League, but was induced to retire from it by his brother, who succeeded in conjoining an adoption of the Reformation in his own dominions with

a careful avoidance of conflict with the emperor and Roman Catholic party. The church ordinance which he framed for Brandenburg was drawn up in such a way that the head of the state became likewise the head of the state church, and henceforth he regarded himself, like Henry VIII. of England, as standing towards his own country in the place of the pope. The public introduction of the new faith was accomplished without difficulty, and the clergy witnessed the secularization of their property with much equanimity. The funds thus acquired by Joachim, a prince of magnificent ideas and of lavish expenditure, were of great service to him; but part of them he devoted to the encouragement of science and art. A compact of mutual right of eventual inheritance made in 1537 with the duke of Liegnitz and Brieg was of great ultimate importance as affording Frederick II. a pretext for his claims to Silesia. A still more useful arrangement of a similar kind was carried out by Joachim in 1569, when he secured the right of succession to the duchy of Prussia.

Brandenburg from 1415 to 1571.

Between the accession of the Hohenzollern dynasty and the period at which we have now arrived the area of Brandenburg had been increased to nearly 15,000 square miles, and its material prosperity had grown in at least an equal ratio. It was still, however, far from being a compact or united state, nor had it as yet any pretension to an independent part on the European stage. Perhaps the most marked internal change was the increase in the power of the estates, resulting in great measure from the financial needs of the electors. Their gradual progress towards complete recognition as a co-ordinate branch of government may be said to have culminated in the formal declaration of Joachim II., that he would never undertake any action of importance affecting the welfare of his subjects without first consulting the estates. Yet alongside of this growth of the estates there were other causes at work paving the way for the future absolutism of the rulers. Thus the new ecclesiastical constitution brought the elector, as head of the church, into immediate relation with all classes of the people, and the abolition of the distinction between mediate and immediate subjects in the religious sphere prepared the way for a similar position in secular matters. So too the introduction of Roman law accustomed the mind to dwell on the central authority and administration, and its very terminology promoted the conception of the elector as a "royal" ruler. A more important cause, however, than either of these was the gradual decline of the power of the towns, with the accompanying revival of that of the nobles. The practical independence and comparative wealth of the towns had been followed by intestine feuds, in which the patricians were arrayed against the guilds, and these not only weakened the towns directly, but also gave the electors frequent pretexts to interfere and curtail their privileges. At the end of the reign of Joachim II. the elector and the diet, the noblesse and the municipalities, were still in a state of comparative and promising equilibrium. But it was evident that the power of the diet was now almost wholly confined to its command of the purse, and that an elector who could make himself independent of its subsidies would be in a position to defy its claims; while it was equally evident that the growing weakness of the towns was incapacitating them for any effectual resistance to an ambitious prince, who might utilize the congenial support of the noblesse as a stepping-stone to arbitrary power. The short-sighted and selfish neglect of general questions now making way among the separate sections of the diet, and their increasing tendency to appear at those sittings only in which their own peculiar interests were under discussion, also helped to free the hands of the electors. The condition of the peasantry

had been steadily deteriorating, and their personal rights were already seriously encroached upon.

Under Joachim's son, John George (1571-1598), who John George permanently reunited the Neumark with Brandenburg, the tendencies just noticed received emphatic expression. All vacant official positions were filled with members of the noblesse, who also received the right of exacting compulsory service from the peasants and other similar privileges. The elector, who acquired the name of "Oekonom" or steward from his admirable financial management, soon reduced the large debt left by his father, and, leaning on the support he had earned from the barons, was able to act with great independence towards the other elements of the diet. During his undisturbed reign the material prosperity of Brandenburg advanced considerably, and the population was increased by numerous Protestant refugees from France and Holland. Joachim Frederick (1598-1608) had the good sense and resolution to oppose the testament of his father, which had assigned the Neumark to his younger brother, and in the Gera Bond executed a solemn ratification of the *Dispositio Achillea*. Ansbach and Baireuth were formally relinquished to the younger line, and have never since, except from 1791 to 1806, formed part of the Prussian dominions. This reign is memorable for the establishment of a state council (*Staatsrath*), which served in some degree as a ministerial cabinet, and may be characterized as the nucleus of the bureaucracy of modern Prussia. John Sigismund (1608-1619) does not seem to have been a man of marked personal character, but his reign is of great importance in the history of Brandenburg on account of the extensive territorial enlargement that fell to its lot. The contingency which had been contemplated in the treaty with Prussia in 1569 was realized on the death of Duke Albert in 1618; and John Sigismund, whose title was strengthened by his marriage with the late duke's daughter, inherited the duchy. His marriage also brought him a claim to the duchies of Cleves and Jülich and other lands near the Rhine, but this title was disputed by the count palatine of Neuburg. The count embraced Roman Catholicism, and his contest with the elector soon became a mere incident in the great conflict that now broke out between the two religions. The disputed territories were occupied by Spanish and Dutch troops, and neither claimant derived much advantage from them till after the Thirty Years' War. For a time, however, the outlying possessions of John Sigismund touched on both sides the limits of modern Prussia. In 1613 the elector, either from pure conviction or from a desire to conciliate the Reformed diet of Cleves, announced his adoption of the Reformed (Calvinistic) type of Protestantism, an action that gave great offence in his older dominions. He made, however, no attempt to induce his subjects to follow his example, and may be said to have inaugurated the policy of religious toleration that has since been characteristic of Prussian rulers. During his reign his territories were more than doubled in extent, covering at his death an area of 31,000 square miles; but the elector of Brandenburg could not yet claim to rank above those of Bavaria and Saxony.

Duchy of Prussia.—The duchy of Prussia, thus acquired by the elector, formed the eastern half of the territory bearing the name of Preussen, and stretched along the Baltic Sea from the Vistula to the Memel. It still remained a Polish fief, and was separated from the rest of the electoral dominions by West Prussia, which the Teutonic Order had been forced to resign to Poland a century and a half before. The native Prussians were of a race akin to the Letts and Lithuanians, and their name (*Pruzi*, *Prutheni*) was probably derived from a Lettish root meaning "intelligence."¹ Towards the end of the

¹ The traditional connexion of the name with the proximity of

first century of the Christian era we find authentic accounts of the importation by the Romans of amber from the Baltic coast, but the first mention of the Pruzi by name occurs in a document of the 9th century. Their first appearance in German history is connected with the attempt made in 997 by Adalbert, bishop of Prague, to convert them to Christianity. But his efforts, as well as those of his successor Bruno, met with little success, and each of these pious missionaries found a martyr's grave on the shore of the Baltic. The obstinate adherence of the natives to their paganism was strengthened by their natural suspicion of a political aim under cover of missionary enterprise, and they felt that they were fighting for their land as well as for their religion. The next serious attempt at their conversion was made two hundred years later by a Cistercian monk named Christian, who at the outset had some success and was appointed first bishop of Prussia. The Prussians, however, soon expelled Christian and his supporters, and even invaded Polish territory, plundering and exacting tribute. In this extremity Christian and Conrad, duke of Masovia, applied for aid to the knights of the TEUTONIC ORDER (*q.v.*), who gladly embarked on this new crusade. The Prussians made a desperate resistance; but the military discipline and strength of the Teutonic knights were not in the long run to be withstood, reinforced, as they were, by crowds of crusaders and adventurers anxious to share in the pious work, and assisted on two occasions by the troops of Ottocar of Bohemia. The knights entered Prussia in 1230, and after half a century of hard fighting found themselves masters of the entire country. They had previously taken care to procure from the emperor and the pope a grant of all the lands they should conquer, as well as of those offered to them by Conrad of Masovia. At first the government of the Order, though arbitrary, was not unfavourable to the welfare of the land. The few native nobles who adopted Christianity were allowed to retain their privileged position, and the ranks of the noblesse were recruited by grants to German knights. Numerous towns and villages were built; the place of the greatly thinned Prussians was taken by industrious German colonists; agriculture and commerce were carried on with energy and success; and all aggression from without was vigorously repelled. The general plan of colonization was similar to that in Brandenburg, except that the place of the margrave was taken by a class of privileged nobles, who divided the power of government among them. In 1309 Pomerelia, to the west of the Vistula, was subdued, and the headquarters of the Order were removed from Venice to the fortress of Marienburg on the Vistula; and before the end of the century the "Ordensland" of Prussia is said to have contained about fifty walled towns, still more numerous castles, and several hundred villages and hamlets, while it extended from Pomerania to the western frontier of Lithuania. The active trade which now flourished was carried on mainly with England and the Hanseatic towns. As time went on, however, the knights allowed their vows of temperance and chastity to sink into abeyance and became enervated by luxury and excess. Their old military skill declined, and they had sunk to such a state of weakness that the single battle of Tannenberg (1410), in which they were defeated by the Poles, shook their power to its foundations. Their arbitrary and exclusive rule now began to reap its reward: the Prussians took advantage of the weakness of the Order to claim a larger share in the government, and, as their burdens continued to grow more oppressive, finally formed an alliance with its arch-enemy Poland. Attacked from

without and weakened by dissension within, the Order was at length compelled to succumb; and a war begun in 1454 ended thirteen years later with the cession of West Prussia to Poland and an acknowledgment of the latter's feudal superiority over the remaining territories of the Order. The knights turned to Germany for help, and endeavoured to persuade powerful German princes to undertake the office of grand master. In 1511 their choice fell on Albert, a member of the Franconian branch of the Hohenzollerns, who undertook the task of reorganization with vigour and attempted to dispense with the oath of fealty to Poland. But, failing to receive any adequate support from the emperor, he at length, acting on the advice of Luther, determined to embrace Protestantism and convert the Ordensland into a secular and hereditary duchy. This momentous transformation was carried out in 1525 without interference from either the empire or Poland, and Albert continued to be a vassal of the latter state as duke of Prussia. The people of Prussia, many of whom had already gone over to the new faith, hailed the reform with great satisfaction, and most of the knights contentedly changed their life-rents for feudal holdings, married, and became hereditary nobles. When it passed into the hands of the elector of Brandenburg, Prussia thus consisted of a compact secular duchy, owing fealty to Poland, and possessing the two well-defined estates of nobles and burghers, the first of which held the reins of power.

John Sigismund died in 1619, a year after his acquisition of Prussia, and left his territories to his son George William (1619-1640). This unfortunate prince may perhaps be described as the first utterly incompetent ruler of his line, though due allowance must be made for the extreme difficulty of his position. Succeeding to power at the outbreak of the great struggle between Catholicism and Protestantism, he neglected the opportunity of joining with Saxony in the formation of a strong league of German Protestant princes, and by his temporizing policy converted his electorate into the common battle-ground. In the language of Carlyle, "where the Titans were bowling rocks at each other, George William hoped by dexterous skipping to escape share of the game." His own irresolution was aided by the fact that his chancellor and chief adviser, Schwarzenberg, was a Roman Catholic and of strong imperialist sympathies, while the great bulk of his subjects dreaded an increase of the power of Calvinism almost more than that of Roman Catholicism. Brandenburg was overrun in turn by Mansfeld, Tilly, and Wallenstein, and suffered as much as if it had taken an active part in the war. The Restitution Edict of 1628, however, gave the elector serious cause of alarm, and the appearance of Gustavus Adolphus before Berlin in 1631 confirmed his faltering decision and made him for a time throw in his lot with the Protestant cause. After the death of Gustavus, Brandenburg followed the example of Saxony in negotiating a separate peace with the emperor (1635). But this apostasy brought little relief, as the emperor gave no aid in expelling the Swedes from Brandenburg and Pomerania, which they continued to occupy for several years. In 1639 the elector removed his court to Königsberg in Prussia, the only part of his realms in which he was sure of comparative tranquillity, and there he died in 1640, leaving a land devastated in great part by fire and sword and at the lowest ebb of dignity and power.

Frederick William (1640-1688), whom both his contemporaries and after ages have agreed to dignify with the title of the "Great Elector," was only twenty years old when he succeeded to the throne, but he at once began to manifest a decided and vigorous character very different from that of his father. He emancipated himself without delay from the guidance of Schwarzenberg, and, in spite of

Russia seems unfounded, and the form *Borussia* or *Porussia*, which has been adopted as the Latin appellation of the country, is used for the first time by a chronicler of the fifteenth century.

the emperor's displeasure, concluded a peace with Sweden, which provided for the withdrawal of the Swedish troops from the electorate. During the following years of war Frederick William preserved a strict neutrality and utilized the opportunity to restore the material resources of his country and reorganize and strengthen his army. The fruits of this line of action were seen at the peace of Westphalia (1648), when Frederick William, as lord of an efficient army of 25,000 men, was able to secure a ready hearing for his claims to territorial extension. He established his right to the whole of Pomerania, but, as the Swedes refused to give up Western or Hither Pomerania (Vorpommern), he received as compensation the rich ecclesiastical principalities of Magdeburg, Halberstadt, and Minden, in central Germany. In the second Swedish and Polish war, which broke out in 1655, he used his intermediate position with great skill and unscrupulousness, allying himself first with one and then with the other of the belligerents, as seemed likely to be most profitable. Thus the troops of Brandenburg took a prominent share in the defeat of the Poles at the three days' battle of Warsaw (1656), in return for which service Sweden undertook to recognize the elector as independent sovereign of the duchy of Prussia. Scarcely, however, did the scale of victory begin to turn than the elector deserted his former ally, and in the treaty of Wehlau (1657) received his reward in the formal relinquishment by Poland of its feudal rights over Prussia. This important step, which added the electorate to the independent states of Europe and prepared the way for the growth of a great north German power, was ratified three years later at the general peace of Oliva. In 1666 the long-vexed question of the inheritance to the Rhenish duchies was settled by an amicable partition, according to which Cleves, Mark, and Ravensberg fell to the share of Prussia. When Louis XIV. attacked Holland in 1672 Frederick William was at first the only German prince to suspect danger in the ambitious designs of the French monarch. In spite of tempting offers from France, he concluded an alliance with Holland, and at the head of Austrian and Brandenburgian troops joined the Dutch in an ineffectual campaign on the Rhine. In 1673 he was forced, through lack of sufficient support from the emperor, to make peace with France; but he joined the triple alliance of Holland, Spain, and the empire in the following year and took part in an indecisive campaign in Alsace. There he received intelligence that the Swedes, at the instigation of France, had broken into Brandenburg. Hastening back to his own country without delay, he took the enemy by surprise, and at the head of about 6000 men gained a brilliant victory over twice that number of Swedish troops at Fehrbellin (1675), a small town to the north-west of Berlin. This success over the hitherto invincible Swedes lent great prestige to the elector's arms, and he followed it up by a series of vigorous campaigns, in which, with the aid of Denmark, he swept Brandenburg and Pomerania clear of the invaders, capturing Stettin in 1677 and Stralsund in 1678. The invasion of Prussia from Livonia, which formed the last effort of the Swedes, was also triumphantly repelled, the most memorable incident of the short struggle being the elector's forced march over the frozen surface of the Frische Haff. At the peace of St Germain (1679), however, owing to the influence of France and the lukewarm support of the emperor, Frederick William saw himself forced to restore Hither Pomerania to Sweden. The policy of the last years of the Great Elector may be described as an endeavour to hold the balance between France and the emperor. At first he joined in a somewhat unnatural alliance with Louis XIV., but after the revocation of the Edict of Nantes (1685) he drew nearer to Austria and covered the emperor's

rear in his war with the Turks. At his death, which took place in 1688, he was engaged in helping the prince of Orange to prepare for his descent on England.

The reign of the Great Elector forms one of the most signal instances in history of the conquest of adverse circumstances by personal energy and merit; and it is with reason that Prussian historians describe him as the second founder of the state. At his accession the greater part of his territory was in the occupation of strangers and devastated by war, and in European politics Brandenburg was regarded as merely an appendage of the empire. Its army was of little value; its soil was poor; and its revenue was insignificant. To other sources of weakness were added the scattered nature of the electoral possessions, their mutual jealousies, and their separate interests. At Frederick William's death the new north German state of Brandenburg-Prussia was a power that had to be reckoned with in all European combinations. Inferior to Austria alone among the states of the empire, it was regarded as the head and patron of German Protestantism; while the fact that one-third of its territory lay outside the empire added to its independent importance. Its area had been raised to 43,000 square miles; its revenue had multiplied fivefold; and its small army was nowhere surpassed in efficiency. The elector had overthrown Sweden and inherited her position on the Baltic, and he had offered a steady and not ineffectual resistance to the ambition of France.

While thus winning for himself a position in the councils of Europe, the elector was not less active in strengthening the central authority within his dominions, and the transformation effected during his reign in the internal government of the state was not less striking than that in its external importance. Frederick William found Brandenburg a constitutional state, in which the legislative power was shared between the elector and the diet; he left it to his successor as in substance an absolute monarchy. Many circumstances helped him in effecting this change, among the chief of which were the want of harmonious action on the part of the estates and the accelerated decline of the political power of the towns. The substitution of a permanent excise for the subsidies granted from time to time by the estates also tended to increase the elector's independence, and the Government officials (*Steuerräthe*) appointed to collect this tax in the towns gradually absorbed many of the administrative functions of the local authorities. The nobles and prelates generally preferred to raise their quota according to the old method of *bede* or "contribution," and this weakened the last bond of common interest between them and the estate of the burghers. In Brandenburg the elector met with little opposition in establishing his personal sovereignty, and after 1653 no general diet of Brandenburg was held. In Cleves and Mark he gained his end simply by an overwhelming display of force; but in Prussia, where the spirit of independence was fostered by its history and by its distance from the seat of power, he found much greater difficulty. His emancipation from the suzerainty of Poland gave him a great advantage in the struggle, though the estates on their side averred that their relation with Poland was one that could not be dissolved except by common consent. It was not until the elector had occupied Königsberg with an armed force, and imprisoned the one (Burgomaster Roth) and executed the other (Baron Kalkstein) of the principal champions of independence, that he was able to bend the estates to his will. Arbitrary and unconstitutional as this conduct seems to us, we must not forget that Frederick William's idea of the functions of an absolute prince was very superior to the unqualified egotism of the French monarchs, and that, while he insisted upon being

Brandenburg under the Great Elector.

master in his own house, it was that he might at the same time be the first servant of the state. In his eyes an absolute government was the best guarantee of the common welfare, and was not sought merely for the sake of personal aggrandizement. It is not without significance in connexion with this that beyond his own territories he twice espoused the cause of the people against an absolute ruler, first in opposing Louis XIV., and again in aiding William of Orange.

In matters of general administration Frederick William showed himself a prudent and careful ruler, and laid the foundation of the future greatness of Prussia in almost every department. The military and bureaucratic systems of the country both received their first important impulse in this reign. The wounds inflicted by the Thirty Years' War were in a great measure healed, and the finances and credit of the state were established on a firm basis. Agriculture and commerce were improved and encouraged by a variety of useful measures, and education was not neglected. The elector even established Prussian colonies in Africa, and formed a small but efficient navy. In matters of religion Brandenburg stands out prominently as the only country of the time in which all Christian confessions were not only tolerated but placed upon an equal footing. The condition of the peasantry, however, reached almost its lowest ebb, and the "recess" or charter of 1653 practically recognizes the existence of villainage. While the barons had been losing power on the one side as opposed to the elector, they had been increasing it on the other at the expense of the peasants. The Thirty Years' War afforded them frequent opportunities of replacing the village "Schulzen" with manorial courts; and the fact that their quota of taxation was wholly wrung from the holdings of the peasants made the burden of the latter four or five times as great as that of the towns. The state of public morals also still left much to be desired, while the clergy were too much occupied with squabbles over Lutheranism and Calvinism to be an effective instrument of reform.

King
Frederick
I.

The Great Elector's son Frederick I. (1688-1713) was an ostentatious and somewhat frivolous prince, who hazarded the acquisitions of his father by looking on his position as assured and by aiming rather at external tokens of his dignity than at a further consolidation of the basis on which it rested. The Brandenburg troops showed all their wonted prowess in the war of the second coalition against Louis XIV. and in that of the Spanish Succession; but Frederick's interests were only mediately concerned, and neither the peace of Ryswick (1697) nor that of Utrecht (1713) brought him any very tangible advantage. Brandenburg soldiers also helped the emperor in his wars with the Turks, and English readers should not forget that Frederick's action in covering the Dutch frontier with 6000 troops left William of Orange free scope in his expedition to England. The most notable incident in Frederick's reign was, however, his acquisition of the title of king of Prussia, which long formed the principal object of his policy, and which led him to make important concessions to all whose cooperation was necessary. The emperor's consent was finally purchased by the promise of a contingent of 8000 men to aid him in the War of the Spanish Succession, and on 18th January 1701 Frederick crowned himself at Königsberg with accompanying ceremonies of somewhat inflated grandeur. Elector Frederick III. of Brandenburg became henceforth King Frederick I. of Prussia,¹ the title being taken from that part of his

territories in which he had no suzerain to acknowledge. Superficial as this incident may at first sight appear, it added considerably to the moral and political momentum of the country, and its advantages were reaped by Frederick's two vigorous successors. About the same time (1697) the elector of Saxony also acquired the kingly dignity by his election to the throne of Poland, but in doing so he had to become a Roman Catholic, and thus left the Hohenzollerns without a rival among the Protestant dynasties of Germany. Frederick was an extravagant ruler, who lavished large sums in maintaining his personal state; but his expenditure was not wholly of this profitless nature, since he founded the university of Halle as a school of liberal theology, established academies of art and science at Berlin, and patronized men of literary eminence. In this he was perhaps mainly inspired by his talented wife Sophia Charlotte, a sister of George I. of England.

The court of Vienna had consoled itself for the growing power of Prussia under the Great Elector by the reflexion that it was probably of a temporary nature and due mainly to the vigorous individuality of that prince. The events of Frederick I.'s reign seemed to justify this view. At his accession Prussia might fairly claim to rank as the second state of Germany and possessed considerable influence as a European power of all but the first order. This, however, had been changed before the death of Frederick. Bavaria, Saxony, and Hanover had all raised themselves to at least a level with Prussia, which now sank back into the position of a merely German state and loyal supporter of the empire. Frederick's preoccupation in the western wars had allowed Sweden to reassert her pre-eminence in northern Europe, and it was Russia and not Prussia that now impeded her progress. The internal soundness of the country had also suffered: the finances were in a state of complete disorganization, and the burden of taxation was almost insupportable. If Frederick's successor had not been a man of vigorous character the downhill progress might have continued, until it had removed Prussia altogether from the list of important states. Perhaps the general estimate of Frederick's character is unduly low owing to the fact that he was followed as well as preceded by a ruler of unusual capacity.

His son Frederick William I. (1713-1740) possessed administrative talents of no mean order and was singularly painstaking, industrious, and determined in carrying out his plans. Though marked by no great external achievements or exciting events, his reign is of the utmost importance in the Prussian annals from having checked the threatened downfall of Prussia and paved the way for Frederick the Great. By carefully husbanding his finances Frederick William filled his treasury and was able to keep on foot one of the largest and best disciplined armies in Europe, thereby securing for Prussia an influence in European councils altogether disproportionate to its size and population. In internal management he made Prussia the model state of Europe, though his administration was of a purely arbitrary type, in which the estates were never consulted and his ministers were merely clerks to register his decrees. The first act of the young king, who was as economical as his father was extravagant, was to institute a salutary reform in the expensive institutions of the court; and some idea of the drastic nature of this change may be gathered from the fact that the annual allowance for the salaries and pensions of the chief court officials and civil servants was at once reduced from 276,000 to 55,000 thalers. The peace of Utrecht (1713), which added Guelders to the Prussian territories, left Frederick William free to turn his attention to the northern war then raging between Sweden on the one side and Russia, Poland, and Denmark on the other. Though at first disposed to be

¹ Strictly speaking, the title assumed was "king in Prussia" (König in Preussen), this apparently being meant to indicate that there was still a Prussia (West Prussia) of which he was not king, though it has also been otherwise explained.

friendly to Sweden, he was forced by circumstances to take up arms against it. In September 1713 Stettin was captured by the allies and handed over to the custody of Frederick William, who paid the expenses of the siege and undertook to retain possession of the town until the end of the war. But Charles XII. refused to recognize this arrangement and returned from his exile in Turkey to demand the immediate restitution of the town. With this demand the Prussian monarch naturally declined to comply, unless the money he had advanced was reimbursed, and the upshot was the outbreak of the only war in which Frederick William ever engaged. The struggle was of short duration and was practically ended in 1715 by the capture of Stralsund by the united Prussians, Saxons, and Danes under the command of the king of Prussia. The Swedes were driven from Pomerania, and at the peace of 1720 Frederick William received the greater part of Vorpommern, including the important seaport of Stettin. Sweden now disappeared from the ranks of the great powers, and Prussia was left without a rival in northern Germany.

A detailed history of Frederick William's reign would necessitate the recital of a long and tedious series of diplomatic proceedings, centring in the question of the succession to the duchies of Jülich and Berg. In 1725 we find the king trusting for support to an alliance with England, while the queen has set her heart on a double marriage between her eldest son and daughter and an English princess and prince. The treaty of Wusterhausen between Austria and Prussia was concluded in the following year, and was confirmed with some modifications by the treaty of Berlin in 1728. Frederick William engaged to recognize the Pragmatic Sanction, while the emperor on his side undertook to support Prussia's claims to Jülich and Berg. The policy of the latter, however, was far from straightforward, as he had already entered into a similar compact with the count palatine of Sulzbach, the rival claimant to the succession, who was a Roman Catholic and therefore a more sympathetic ally. Frederick William's intervention in the matter of the succession to the throne of Poland, rendered vacant by the death of Augustus II. in 1733, proved barren of advantage to Prussia and failed to secure the hoped-for reversion of the duchy of Courland. A Prussian contingent took part none the less in the ensuing war between Austria and France, but Austria concluded peace in 1735 without consulting her ally. In 1737 the king was resolute enough to withstand the pressure brought to bear upon him by England, France, Holland, and Austria in order to induce him to submit to their settlement of the Jülich-Berg question; and in 1739, convinced at last of the confirmed duplicity of the emperor, he turned to his hereditary enemy for help and concluded a defensive alliance with France. This action may be looked upon as marking the end of that phase in the relations of the houses of Hapsburg and Hohenzollern in which the latter regarded the former with simple loyalty as its natural suzerain; the rivalry between Austria and Prussia had begun, and for the rest of the century formed the pivot on which the politics of Europe mainly turned. Frederick William died in 1740, conscious of his diplomatic failures, but confident that his son would repair his errors.

Prussia
under
Frederick
William
I.
If the external history of Frederick William's reign is not especially glorious, and if in diplomacy he was worsted by the emperor, the country at least enjoyed the benefits of a twenty-five years' peace and those of a well-meaning, though somewhat too patriarchal, government. During this reign the revenues of Prussia were doubled, and the king left at his death a well-filled treasury and an army of 85,000 men. Though not ranking higher than twelfth among the European states in extent and population,

Prussia occupied the fourth place in point of military power. The king himself took the greatest interest in the management of his army, in which the discipline was of the strictest; and he carried the habits of the military martinet into all departments of the administration. His untiring industry occupied itself with the minutest details of government, and his downright blunt character showed there to greater advantage than in diplomatic circles. His chief innovation was the abolition of the distinction between the military and civil funds, and the assignment of the entire financial management of the country to a general directory of finance, war, and domains. Hitherto the proceeds of the excise and contribution had been paid into the military chest, while those of the royal monopolies and domains belonged to the civil service, deficiencies in one department being made good by the surplus of the other. Now, however, the directory was instructed to pay for everything out of a common fund, and so to regulate the expenditure that there should invariably be a surplus at the end of the year. As the army absorbed five-sevenths of the revenue, the civil administration had to be conducted with the greatest economy. The king himself set the example of the frugality which he expected from his officials, and contented himself with a civil list of 52,000 thalers (£7800). The domains were now managed so as to yield a greater income than ever before, and important reforms were made in the system of taxation. By the substitution of a payment in money for the obsolete military tenure the nobles were deprived of their practical exemption from taxation, and they were also required to pay taxes for all the peasant holdings they had absorbed. Attempts were made to better the condition of the peasants, and the worst features of villainage were abolished in the crown domains. The military system of cantonment, according to which each regiment was allotted a district in which to recruit, was of constitutional as well as military importance, since it brought the peasants into direct contact with the royal officials. The collection of the taxes of the peasantry was removed from the hands of the landowners. The duties of the state officials were laid down with great detail, and their performance was exacted with great severity. Official corruption was punished with extreme rigour. Justice seems to have been administered in an upright if somewhat Draconian manner, though the frequent and often arbitrary infliction of the penalty of death by the king strikes us with astonishment. The agricultural and industrial interests of the country were fostered with great zeal. The most important industrial undertaking was the introduction of the manufacture of woollen cloth, the royal factory at Berlin supplying uniforms for the entire army. The commercial regulations, conceived in a spirit of rigid protection, were less successful. In the ecclesiastical sphere the king was able to secure toleration for the Protestants in other parts of Germany by reprisals on his own Roman Catholic subjects, and he also gave welcome to numerous Protestant refugees, including 18,000 exiled peasants from Salzburg. For art, science, and the higher culture he had no respect, but he has the credit of founding the common-school system of Prussia and of making elementary education compulsory.

After the accession of Frederick the Great (1740-1786) Frederick the external history of Prussia coincides to such an extent with that of the German empire that it has already been treated with considerable detail in the article GERMANY (vol. x. pp. 503-4; see also FREDERICK II.). The outline of Frederick's foreign policy was probably determined in some degree by the events of the later years of his father's reign, and Austrian duplicity in the matter of Jülich gave him a colourable pretext for his hostile attitude in reviving

the long dormant claims of Prussia to the Silesian duchies. Within a year of his accession he had embarked on the first Silesian War, and this was closely followed by the second, which ended in 1745, leaving Frederick in undisputed possession of almost the whole of Silesia, with the frontier that still exists. East Friesland, the Prussian claim to which dated from the time of the Great Elector, was absorbed in 1744 on the death without issue of the last duke. The two Silesian wars completely exhausted the stores left by Frederick William, both of grenadiers and thalers, and Frederick gladly welcomed the interval of peace to amass new treasures and allow his subjects time to recover from their exertions. The measures he took were so successful that when the Seven Years' War broke out in 1756 he had an army of 150,000 men at his command, representing about one-seventh of the available male population of his little kingdom. He had also a fund of eleven million thalers in his treasury, though this would have gone but a small way in defraying the expenses of the protracted struggle had he not been assisted by the subsidies of England and able to make the fertile plains of Saxony his chief basis of supply. The succession of brilliant campaigns in which Frederick maintained himself against a coalition embracing nearly the whole of Europe has been narrated in the article AUSTRIA (vol. iii. p. 127 sq.). As Macaulay points out in a somewhat highly-coloured passage, Frederick ruled over a population of less than five million souls, while his adversaries could draw their armies from a joint population of a hundred millions. The disproportion in wealth was at least as great. Nor was the small size of Frederick's land made up for by its strong patriotism and loyalty; on the contrary, the affections of his subjects had been partially alienated by the severity of his rule and the weight of taxation. Prussia had no strong natural bulwarks on its frontiers, but lay exposed to every foe. Yet Frederick's brilliant military genius was able to counteract all these disadvantages and carry on the contest in spite of all odds.

Prussia
under
Frederick
II.

Though without gain in extent or population, Prussia emerged from the war as an undoubted power of the first rank, and henceforth completely eclipsed Saxony, Bavaria, and Hanover, while it was plain that Austria would no longer stand without a rival for the hegemony of the German empire. The glorious victories over the French and Russians also awakened a spirit of German patriotism that had hitherto been almost unknown. But the price paid for these results was enormous. Of the 850,000 soldiers who, as is estimated, perished during the war about 180,000 fell in the service of Prussia, and the gross population of the kingdom had decreased in seven years to the extent of half a million souls. The misery and poverty indirectly attendant on the war were incalculable. Numerous Prussian towns and villages were destroyed or made tenantless; large tracts were left uncultivated for want of labourers; and famine reigned to such an extent that even the seed-corn was converted into bread. The development of the country was thrown back for many years, which were almost a repetition of the period succeeding the Thirty Years' War. But, while nearly a century elapsed before the traces of that struggle disappeared, Frederick, who showed himself great in peace as in war, repaired most of the ravages of the Seven Years' War in a tenth of the time. By great dexterity in the management of his finances he had kept clear of debt, and was soon able to advance large sums to the most impoverished districts. Foreign colonists were invited to repopulate the deserted villages; taxes were in several instances remitted for a series of years; the horses of the army were employed in farm labour; and individual effort in every department was liberally supported by the Government. By 1770 nearly

all the ruined villages had been rebuilt; the ground was again under cultivation; order had been restored; the vacant offices had been filled; and the debased currency had been called in. Throughout the kingdom agriculture was encouraged by the drainage of marshy districts; industry was extended by the introduction of new manufactures, by bounties, and by monopolies; and commerce was fostered by a series of well-meant, if economically unsound, measures of protection. Frederick's methods of administration did not greatly differ from those of his predecessor, though the unrelenting severity of Frederick William was relaxed and the peculiarities of his system toned down. Frederick's industry and activity were as great as those of his father, his insight keener, and his views more liberal. His rule was quite as personal and absolute, and the despotism was altered only in so far as the character of the despot was different. His own personal supervision extended to every department, and his idea of his position and duties made him his own first minister in the widest and most exacting sense of the term. He endeavoured to spare his subjects as far as was compatible with the immense army he maintained, and sought to raise the necessary revenues rather by improving the resources of the country than by additional taxation. He kept the charges of the civil administration down to the lowest point consistent with efficiency, and the court establishment was very economical, though it avoided the extreme of shabbiness witnessed under Frederick William. His efforts to improve the administration and the bureaucracy were unceasing, and he succeeded in training a body of admirable public servants. One of his most sweeping reforms was in the department of law, where, with the able aid of Cocceji, he carried out a complete revolution both in procedure and personnel. The expenses of justice were greatly lightened, and no suit was allowed to drag on for more than a year. A complete divorce was effected between the departments of justice and provincial administration, a change that greatly strengthened the position of the private citizen in any contest with the officials of Government. One of the king's first acts was to abolish legal torture, and he rarely sanctioned capital punishment except in cases of murder. The application of the *privilegium de non appellando* (1746) freed Prussia from all relations with the imperial courts and paved the way for a codification of the common law of the land, which was begun under Frederick but not completed till the end of the century. In matters of religion Frederick not only exercised the greatest toleration, remarking that each of his subjects might go to heaven after his own fashion, but distinctly disclaimed the connexion of the state with any one confession. Equal liberty was granted in speaking and writing. Though his finances did not allow him to do much directly for education, his example and his patronage of men of letters exercised a most salutary effect. The old system of rigid social privilege was, however, still maintained, and unsurmountable barriers separated the noble from the citizen and the citizen from the peasant. The position of the last was very deplorable; villainage still to a great extent existed, and the mental attitude of the rural population was servile in the extreme.¹ The paramount defect of Frederick's administration, as future events proved, was the neglect of any effort to encourage independence and power of self-government among the people. Every measure emanated from the king himself, and the country learned to rely on him alone for help in every emergency. Public opinion on political matters could not be said to exist; and the provincial diets met simply to receive the instructions of the royal agents.

¹ One illustration of this is afforded by the fact that the private soldiers felt no resentment at being struck by their officers.

In 1772 Prussia and Austria, in order to prevent an overweening growth of Russia, joined in the first partition of Poland. Frederick's share consisted of West Prussia and the Netze district, a most welcome addition, filling up the gap between the great mass of his territories and the isolated district of East Prussia. It had also this advantage over later acquisitions at Poland's expense, that it was a thoroughly German land, having formed part of the colonizations of the Teutonic Order. In 1778 Prussia found herself once more in opposition to Austria on the question of the Bavarian succession, but the war that ensued was almost entirely nominal, and the difficulty was adjusted without much bloodshed. The same question elicited the last action of importance in which Frederick engaged,—the formation of a "Fürstenbund," or league of German princes under Prussian supremacy, to resist the encroachments of Austria. The importance of this union was soon obscured by the momentous events of the French Revolution, but it was a significant foreshadowing of the duel of Austria and Prussia for the pre-eminence in Germany. Frederick died on 17th August 1786, having increased his territories to an area of 75,000 square miles, with a population of five and a half millions. The revenue also had immensely increased and now amounted to about twenty million thalers annually, of which, however, thirteen were spent on the army. The treasury contained a fund of sixty million thalers, and the land was free of debt.

Frederick William II. A continuation of the personal despotism under which Prussia had now existed for seventy years, as well as of its disproportionate influence in Europe, would have required a ruler with something of the iron will and ability of Frederick the Great. Unfortunately Frederick's nephew and successor, Frederick William II. (1786-1797), had neither the energy nor the insight that his position demanded. He was too undecided to grasp the opportunity of adding to Prussia's power by adhering to the vigorous external policy of his predecessor, nor did he on the other hand make any attempt to meet the growing discontent of his subjects under their heavy burdens by putting himself at the head of an internal movement of liberal reform. The rule of absolutism continued, though the power now lay more in the hands of a "camarilla" or cabinet than in those of the monarch; and the statesmen who now came to the front were singularly short-sighted and inefficient. The freedom of religion and the press left by Frederick the Great was abrogated in 1788 by royal ordinance. In 1787 the army engaged in an expensive and useless campaign against Holland. The abandonment of Frederick's policy was shown in a tendency to follow the lead of Austria, which culminated in an alliance with that power against revolutionary France. But in 1795 Prussia, suspicious of the Polish plans of Russia and Austria, concluded the separate peace of Basel, almost the only redeeming feature of which was the stipulation that all north German states beyond a certain line of demarcation should participate in its benefits. This practically divided Germany into two camps and inflicted a severe blow on the imperial system. The indifference with which Prussia relinquished to France German lands on the left bank of the Rhine, compared with her eagerness to increase her Slavonic territories on the east, was certainly one of the great blunders of the reign. Prussia's share in the second and third partitions of Poland (1793 and 1795) nearly doubled her extent, but added little or nothing to her real power. The twelve years following the peace of Basel form one of the most sombre periods of the history of Prussia. Her prestige was lost by her persistent and ill-timed neutrality in the struggle with France; the old virtues of economy, order, and justice disappeared from the bureaucracy; the army was gradually losing its excellence and was weakened

rather than strengthened by the hordes of disaffected Polish recruits; the treasury was exhausted and a large debt incurred; the newly-awakened feeling of German patriotism had died away, especially among the upper classes.

Frederick William III. (1797-1840) possessed many virtues that did him credit in his private capacity, but he lacked the vigour that was at this juncture imperatively required from a ruler of Prussia, while he was unfortunately surrounded by counsellors who had as little conception as himself of Prussia's proper rôle. He continued to adhere closely to a policy of timid neutrality and seemed content to let Prussia slip back into the position of a second-rate state, the attitude of which in the great European struggle could be of no special importance. Not even the high-handed occupation of Hanover by the French in 1803 could arouse him; and the last shred of self-respect seemed to have been parted with in 1805 when Prussia consented to receive Hanover, the property of its ally England, from the hands of France. The formation of the Confederation of the Rhine in 1806 and the intelligence that France had agreed to restore Hanover to England at last convinced Frederick William of what he had to fear from Napoleon; while Napoleon on his side, being now free of his other antagonists, was only too glad of an opportunity to destroy his tool. Prussia declared war on 9th October 1806; and the short campaign that ensued showed that the army of Frederick the Great had lost its virtue, and that Prussia, single-handed, was no match for the great French commander. On 14th October the Prussian armies were overthrown at Jena and Auerstädt, and a total collapse set in. Disgraceful capitulations of troops and fortresses without a struggle followed one another in rapid succession; the court fled to East Prussia; and Napoleon entered Berlin in triumph. At the peace of Tilsit (9th July 1807) Frederick William lost half his kingdom, including all that had been acquired at the second and third partitions of Poland and the whole of the territory to the west of the Elbe. An enormous war indemnity was also demanded, and the Prussian fortresses were occupied by the French until this should be paid. Prussia now paid heavily for its past remissness and drained the cup of humiliation to the dregs.

The next half-dozen years form a period of the greatest significance in the history of Prussia, embracing, as they do, the turning-point in the moral regeneration of the country. The disasters of 1806 elicited a strong spirit of devoted patriotism, which was fanned by the exertions of the "Tugendbund," or League of Virtue, and by the writings of men like Fichte and Arndt. This was accompanied by a wonderful revelation of vitality and recuperative power. The credit of the reformation belongs mainly to Stein's the great minister Stein, and in the second place to the reformer chancellor Hardenberg. The condition on which Stein based his acceptance of office was itself of immense importance; he insisted that the system of governing through irresponsible cabinet councillors, which had gradually become customary, should cease, and that the responsible ministers of departments should be at once the confidential advisers and the executive agents of the king. Stein's designs and wishes extended to the establishment of a regular system of parliamentary and local government like that of England, but he had not an opportunity to do much more than begin the work. His edict of 1807 abolished serfdom and obliterated the legal distinction of classes by establishing freedom of exchange in land and free choice of occupation.¹ The "Städteordnung" of 1808

¹ Previous to this measure the distinction between "noble," "burgher," and "peasant" land and occupations was strictly observed, and no transition of property or employment from one class to another was possible.

reformed the municipalities and granted them important rights of self-government. His administrative reforms amounted to a complete reconstruction of the ministerial departments and the machinery of provincial government, and practically established the system now in force. In 1810 Hardenberg, with a precipitancy which Stein would scarcely have approved, continued the reform in the condition of the peasants by making them absolute owners of part of their holdings, the landlords obtaining the rest as an indemnity for their lost dues.¹ The revolution thus effected in Prussia has been aptly compared in its results to the great revolution in France; but, while there the reforms were exacted by a people in arms, here they were rather forced upon the people by the crown. The army was also reorganized by Scharnhorst and Gneisenau, while the condition imposed by Napoleon that it should not exceed 42,000 men was practically evaded by replacing each body of men by another as soon as it was fairly versed in military exercises. The educational reforms of William von Humboldt established the school system of Prussia on its present basis, and the university of Berlin was founded in 1809.

Frederick William hesitated to take part in the Austrian rising of 1809, but his opportunity came in 1813, when Napoleon fled from Russia, denuded of his troops. General York, commander of the corps that Prussia had been obliged to contribute to the French expedition, anticipated the formal declaration of war by joining the Russians with his troops on his own responsibility (30th December 1812). On the outbreak of the war the people rose *en masse* and with the utmost enthusiasm. The regular army was supported by hosts of "Landwehr," or militia, eager to share in the emancipation of their country. A treaty of alliance between Russia and Prussia was concluded at Kalisch, and Austria, after some hesitation, also joined the league against Napoleon. In the struggle that followed (see AUSTRIA, vol. iii. pp. 134-135) Prussia played one of the most prominent parts, and her general Blücher ranks high among the heroes of the war. Between 1813 and the battle of Waterloo Prussia lost 140,000 men, and strained her financial resources to the utmost. As compensation she received at the congress of Vienna the northern half of Saxony, her old possessions to the west of the Elbe, Swedish Pomerania, the duchies of Berg and Jülich, and other districts in Westphalia and on the Rhine. The acquisitions of the last partition of Poland, with the exception of the grand-duchy of Posen, were resigned to Russia, Friesland went to Hanover, and Bavaria was allowed to retain Baireuth and Ansbach, which had come into her hands in 1806. This rearrangement of the map did not wholly restore Prussia to its former extent, as its area was now only 108,000 square miles compared with 122,000 square miles at the beginning of 1806, but the substitution of German for Slavonic territory and the shifting of the centre of gravity towards the west more than made up for any slight loss in mere size. Hanover still formed a huge wedge splitting Prussia completely in two, and the western frontier was very ragged. Prussia's position required caution, but forced upon it a national German policy, and the situation of the new lands was vastly more effectual in determining the future leader of Germany than was Austria's aggrandizement in Italy. The work of incorporating the new provinces was accomplished with as little friction as possible, and the Prussian statesmen had the good sense to leave the Rhenish districts in the full enjoyment of the institutions they had been used to under the French régime.

The remainder of Frederick William III.'s reign, though

¹ The patrimonial jurisdiction of the landowners was not taken away till 1848.

marked by much material and social progress, was in the political sphere a period of the most deplorable reaction. At first the king seemed disposed to fulfil his promise of 1815 and grant the country a constitution, but ultimately both he and his minister Hardenberg suffered themselves to be dragged in the wake of the retrogressive policy of Metternich. The only concession made to the popular demand was the utterly inadequate patent of 1823, appointing triennial provincial diets with a merely consultative function. The king also allowed himself to be alarmed by the ultra-liberal movement at the universities, and joined in the notorious Carlsbad decrees (1819) and in the senseless prosecutions of demagogues that formed the sequel. Many of Prussia's noblest and most patriotic sons now suffered unmerited punishment, and the Government showed a total incapacity to understand the real state of affairs. Respect for the aged king, however, prevented an outburst during his reign. After 1830 Prussia began to shake herself clear of the Austrian leading-strings, and the establishment of the "Zollverein," or customs union of the German states under Prussian supremacy, was a decided step towards a policy of independence. In ecclesiastical matters this reign is memorable for the union forced by the crown upon the Lutherans and Calvinists, and for the preliminary symptoms of the "Culturkampf."

Frederick William IV. (1840-1861), a man of character and intelligence, began his reign promisingly by an amnesty for political offenders and by well-meant concessions to the dissatisfied Ultramontanes; but it soon became evident that he held too exalted an idea of the divine right of kings willingly to grant such a constitution as was required. Then followed the contest between the crown and the people, the various steps of which have been chronicled in the article GERMANY. At last the king had to give way and grant a constitution based upon democratic principles, and substituting a representative parliament for the old Prussian system of estates. This constitution was promulgated on 31st January 1850, and Prussia therewith formally entered the ranks of modern and constitutional states. But in the following years the king maintained as reactionary a policy as was in any way compatible with the constitution, receiving his chief support in this line of action from the Prussian "Junkerthum," or squirearchy. In external politics the chief feature of the reign is Prussia's neglect of the opportunity to take up a strong position as the political and military leader of northern and central Germany: the king refused the imperial crown offered to him by the Frankfort Parliament in 1849, and allowed Prussia to play a subordinate rôle at Olmütz in the following year. Towards the close of his life the Prussian Government was distrusted at home and discredited abroad.

In 1858 William, prince of Prussia, became regent in consequence of the mental illness of his brother, and in 1861 he succeeded to the throne as William I. His accession was hailed as likely to increase both the liberalism of Prussia's internal institutions and the vigour of its external policy; and the second at least of these expectations was not disappointed. But at an early period of his reign the king became involved in a constitutional dispute with the House of Representatives, which declined to grant the supplies necessary for an extensive system of military reorganization. Bismarck, who became prime minister in 1862, refused to allow the crown to be hampered by parliamentary restrictions and raised the funds required in defiance of the attitude of the lower house. This internal conflict may have had its influence in forcing upon the ministry the necessity of a strong foreign policy, especially in its dealings with Austria, though the party of reform believed that the hegemony of Germany might have been secured by Prussia without war if she had simply placed

herself at the head of the liberal movement. Prussia's neutral attitude in the Austro-Italian War was the first sign of the coming storm; and then followed the Schleswig-Holstein episode, culminating in the war of 1866 (see AUSTRIA), the successful issue of which expelled Austria from Germany and left its rival in undisputed possession. The territorial acquisitions which Prussia now made, consisting of Hanover, Hesse-Cassel, Hesse-Nassau, Frankfurt, and Schleswig-Holstein, increased its extent by about a fifth and for the first time gave a satisfactory rounding-off to its form. The Prussian landtag, carried away by success, granted Bismarck, by a large majority, the indemnity he had the grace to ask for in regard to his previous unconstitutional proceedings in the financial dispute.

The war of 1866 gave the deathblow to the Germanic Confederation of 1815, and in its place appeared the North German Confederation under the lead of Prussia. The transformation was completed five years later, after the successful war with France, when the south German states also joined the union and the king of Prussia became the German emperor. The united Germany that Frederick the Great had sought in the Fürstenbund, that Frederick William III. had tried to organize in 1806 in opposition to the Confederation of the Rhine, that Frederick William IV. had hoped to achieve in 1850, was at length an accomplished fact. In entering this union Prussia may in a sense be said to have abdicated her position as a great power in favour of Germany, but her influence within the empire, practically comprising that of all the small north German states, is so overwhelming that her identity is not likely ever to be wholly lost. Any measure increasing the power of the empire at the expense of the individual states is tantamount to an increase of the power of Prussia.

Since the Franco-German War the history of Prussia has been for the outside world practically identical with that of Germany and has centred in the figure of Prince Bismarck. The policy of the imperial chancellor and Prussian premier is essentially autocratic in its nature, and seems to have for its keynote the necessity of maintaining at any price a strong central Government to cope with external emergencies. He identifies himself with no party, but generally manages by timely concessions to form such temporary parliamentary combinations as are necessary to carry the measures he has most at heart. On the other hand, he does not hesitate freely to call into requisition the royal veto on resolutions of parliament of which he does not approve. His reversion to a strong protectionist policy, which became marked in 1879, the date to which the history is brought down in the article GERMANY, has so far proved permanent, and numerous protective measures have been passed, though his favourite scheme of a Government monopoly of tobacco has been decisively rejected both by the imperial and the Prussian chambers. As a pendant to these measures may be mentioned the laws intended to improve the position of the working classes, most of which are inspired by a spirit of state socialism. The alienation of the National Liberals, occasioned by the change in Bismarck's economic policy, has compelled him to seek his later majorities in a combination of Conservatives and Ultramontanes, the benefit of which has been mainly reaped by the latter. On the accession of Pope Leo XIII. some conciliatory advances were made by Rome and Prussia; in 1881 diplomatic relations were reopened with the Vatican, and several important concessions were made by a measure passed in 1883. The May laws have not been repealed, but they have latterly been put in force with much less stringency, and a great many of the vacant bishoprics and pastorates have been at least temporarily filled. The Ultramontanes continue to form one of the largest "fractions" both in the reichstag

and in the Prussian landtag. In spite of the continued existence of the special law passed against the socialists, which has been prolonged from time to time, their numbers have grown steadily, and in the autumnal election of 1884 they returned no fewer than twenty-four of their candidates to the reichstag, polling 550,000 votes, or about ten per cent. of the total number recorded. Their success was especially marked in Berlin, where they returned two members and polled 70,000 votes. The same election was also remarkable for the diminution of the German Liberals (*Deutsch-Freisinnige*), a party formed by the fusion of the Progressists and Secessionists.

Perhaps the most significant event in the recent history of Germany has been her entrance into the ranks of the colonial powers by the annexation in 1884 of several districts on the west coast of Africa, and among the islands of the Pacific Ocean. In this step Prince Bismarck has revived a policy that has slumbered since the time of the Great Elector (see p. 8), but there seems little reason to doubt that this new scheme of colonization will prove of more permanent importance than that of the 17th century.

CHRONOLOGICAL TABLE OF THE CHIEF EVENTS IN THE HISTORY OF PRUSSIA.

980. Foundation of the North Mark, the nucleus of Brandenburg. 1184. Albert the Bear is invested with the North Mark, and founds the Ascanian line of margraves. 1280-83. Conquest of Preussen by the Teutonic Order. 1324-66. Margraves of the Bavarian line. 1356. Brandenburg definitely recognized as an electorate. 1373-1413. Luxemburg line of electors. 1415. Frederick of Hohenzollern becomes elector of Brandenburg. 1539. Reformation proclaimed by Joachim II. 1618. Duchy of Prussia inherited by Elector John Sigismund. 1640. Accession of Frederick William, the Great Elector. 1648. Brandenburg-Prussia receives farther Pomerania, Magdeburg, Halberstadt, and Minden at the peace of Westphalia. 1657. Independence of the duchy of Prussia recognized. 1675. Victory over the Swedes at Fehrbellin. 1701. Elector Frederick assumes the title of "king of Prussia." 1720. Acquisition of Hither Pomerania. 1740. Accession of Frederick the Great. 1742. Acquisition of Silesia at the close of the first Silesian War. 1744-45. Second Silesian War. 1756-63. Seven Years' War; principal victories: Prague (6th May 1757), Rossbach (5th November 1757), Leuthen (5th December 1757), Liegnitz (15th August 1760), and Torgau (3d November 1760); principal defeats: Kolin (18th June 1757), Hochkirch (14th October 1758), Kunersdorf (12th August 1759). 1772. First partition of Poland: acquisition of West Prussia. 1792. War with France. 1793. Second partition of Poland; acquisition of South Prussia. 1795. Third partition of Poland; acquisition of New East Prussia; peace of Basel, providing for Prussia's neutrality in the struggle with France. 1806. War declared against Napoleon; defeats of Jena and Auerstedt; Prussia conquered by the French. 1807. Peace of Tilsit and dismemberment of the kingdom. 1808. Beginning of Stein's constitutional reforms. 1813. War of liberation; battle of Leipzig (16th to 19th October). 1814-15. Congress of Vienna; Prussia rehabilitated; establishment of the Germanic Confederation. 1815. Battle of Waterloo. 1850. Promulgation of the Prussian constitution. 1864. War with Denmark. 1866. War with Austria; battle of Königgrätz (3d July); acquisition of Hanover, Schleswig-Holstein, and electoral Hesse; establishment of North German Confederation. 1870-71. War with France. 1871. The king of Prussia proclaimed German emperor.

GEOGRAPHY AND STATISTICS.

*Physical Features.*¹—Fully three-fifths of Prussia belong to the Physical great north European plain and may be generally characterized as features. lowlands. The plain is much wider on the east, where only the southern margin of Prussia is mountainous, than on the west, where the Hanoverian hills approach to within less than 100 miles of the sea. A line drawn from Düsseldorf through Halle to Breslau would, roughly speaking, divide the flat part of the country from the hilly districts. In the south-east Prussia is separated from Austria and Bohemia by the Sudetic chain, which begins at the valley of the Oder and extends thence towards the north-west. This chain includes the Riesen Gebirge, with the highest mountain in Prussia (Schneekoppe, 5266 feet), and subsides gradually in the hills of Lusatia. The Harz Mountains, however, beyond the Saxon plain, follow the same general direction and may be regarded as a detached continuation of the system. To the south of the Harz the Prussian frontier intersects the northern part of the Thuringian Forest, which is also prolonged towards the north-west by the Weser Hills and the Teutoburgian Forest. The south-west of Prussia is occupied by the plateau of the lower Rhine, including on the left bank the Hunsrück and the Eifel, and on the right the Taunus, the Westerwald, and the Sauerland. Between the lower Rhenish and Thuringian systems are interposed the Vogelsberg, the Rhön, and other hills belonging to the Triassic system of the upper Rhine. The Silesian mountains are composed chiefly of granite, gneiss, and schists, while the Harz and the lower Rhenish plateau are mainly of Devonian and Silurian formation. To the north of the Sauerland is the important Carboniferous system of the

¹ The physical features of Prussia have been already so fully described under GERMANY that it has been deemed unnecessary to give here more than the briefest recapitulation. For other points which the reader may here miss he is also referred to that article.

Ruhr, and there are also extensive coal-fields in Silesia. With the exception of the Danube Prussia is traversed by all the chief rivers of Germany, comprising almost the entire course of the Oder and the Weser. Nearly the whole of the German coast-line belongs to Prussia, and it possesses all the important seaports except the two most important of all, Hamburg and Bremen.

Climate. *Climate.*—The climate of Prussia is rendered more uniform than it would otherwise be by the fact that the average elevation increases from north to south. The greatest extremes of temperature are found between the east and west, the mean annual warmth in the bleak and exposed provinces of the north-east being about 44° Fahr., while that of the sheltered valley of the Rhine is 6° higher. The difference is greatest in winter, when the respective means are 26° and 35°; in summer the difference is not above 2° to 4°. In Prussia as a whole the thermometer ranges from 100° to -30°, but these extremes are rarely reached. The average annual rainfall is about 21 inches; it is highest in the hilly district on the west (34 inches) and on the north-west coast (30 to 32 inches), and lowest (16 inches) in the inland parts of the eastern provinces.

Soil. *Soil.*—According to the most recent official returns, about 29 per cent. of the soil of Prussia consists of good loam or clay, 32 per cent. is mediocre or of loam and sand mixed, 31 per cent. is predominantly sandy, and 6 per cent. is occupied by bogs and marshes. The north-eastern provinces contain a high proportion of poor soil, and in the north-west occur large tracts of heath and moor. The reclaimed marshlands in both districts, as well as the soil in the immediate neighbourhood of the rivers, are usually very fertile, and admirable tracts of fruitful ground are found in the valleys of the Rhine and its affluents and in the plain around Magdeburg. Patient and long-continued effort has, however, done much to equalize production, and large crops are now grown in some of the most unpromising parts of the kingdom. Prussia contains a greater proportion of tilled land than any of the countries of south Germany, while it is surpassed in this respect by Saxony, Hesse-Darmstadt, and the Thuringian states. The most fertile Prussian province is Saxony, while the least productive are East and West Prussia. The following table shows the distribution of the cultivable area in the different provinces and in the country as a whole:—

Province.	Area.	Arable Land, 50 per cent.	Meadow and Pasture, 20·4 per cent.	Forests, 23·3 per cent.
	Sq. miles.	Acres.	Acres.	Acres.
East Prussia	14,280	4,709,295	2,127,917	1,681,057
West Prussia	9,850	3,455,000	1,124,885	1,349,392
Brandenburg	15,410	4,586,360	1,487,872	3,205,635
Pomerania	11,620	4,152,002	1,408,882	1,480,990
Posen	11,180	4,452,360	984,450	1,454,442
Silesia	15,560	5,588,090	1,055,487	2,907,570
Saxony	9,750	3,836,192	826,352	1,269,990
Schleswig-Holstein ..	7,280	2,712,575	1,857,905	287,917
Hanover	14,940	3,126,182	4,865,115	1,512,567
Westphalia	7,800	2,121,745	1,262,580	1,411,085
Hesse-Nassau	6,060	1,561,552	623,872	1,572,492
Rhenish Prussia	10,420	3,134,190	1,158,065	2,073,580
Hohenzollern	440	180,967	50,212	84,652
Total	184,490	48,566,510	17,782,944	29,311,299

Prussia contains a greater proportion of woodland than any other large country in the south or west of Europe (France 17 per cent., Italy 12 per cent., Great Britain 3 per cent.), though not so large a proportion as Russia, Austria, and some of the minor German states. The most extensive forests are in East and West Prussia, Silesia, and Brandenburg, where coniferous trees prevail, and in the Rhenish and Hessian districts, where oaks and beeches are the most prominent growths. The north-west is almost entirely destitute of timber, and peat is there used universally as fuel. The Government forests cover about 6,000,000 acres, or upwards of one-fourth of the whole, and are admirably managed, bringing in an annual revenue of 1½ millions sterling. The state also controls the management of forests in private possession, and exerts itself to secure the planting of waste lands.

Products. *Products.*—The principal crop in Prussia is rye, of which the ordinary bread of the country is made; it grows in all parts of the kingdom, especially in the north and east, and occupies about one-fourth of the whole tilled surface. Oats occupy an area equal to about half that devoted to rye, and are also grown most extensively in the north-eastern districts. Wheat, which is chiefly cultivated in the south and west, does not cover more than a fourth as much ground as rye. Barley is most largely grown in Saxony and Silesia. Other grain crops are spelt (chiefly on the Rhine), buckwheat (Hanover and Schleswig-Holstein), and millet; maize is grown for fodder in some districts. The produce of grain scarcely covers the consumption and is supplemented by imports of rye and other cereals from Russia and Holland. Potatoes, used both as food and for the distillation of spirits, are cultivated over nearly as large an area as rye and are especially predominant in the eastern provinces. The common beet is extensively grown for the production of sugar in Saxony, Hanover, Silesia, Pomerania, and Brandenburg. Flax and hemp occupy considerable areas in East Prussia, Silesia, and

Hanover, while hops are raised chiefly in Posen and Saxony. The cultivation of rape-seed for oil has fallen off since the use of petroleum has become general. The tobacco of Silesia, Brandenburg, Hanover, and the Rhine province is inferior to that of southern Germany; the annual value of Prussian-grown tobacco is about £500,000, or one-fourth of the total produce of the empire. Only a comparatively small part of the Rhenish wine district falls within Prussia, which does not claim more than a sixth (200,000,000 gallons, value £400,000) of the annual produce of Germany; but this includes many of the choicest varieties, such as Steinberger, Johannisberger, and Rüdesheimer. The best vineyards of the Moselle also belong to Prussia, and inferior kinds of wine are produced in Saxony and Lower Silesia. Great quantities of apples, cherries, and plums are raised on the Rhine, in Saxony, and other districts, while market-gardening on an extensive scale is practised near Erfurt and some other large towns. The hay-meadows of the eastern provinces are the largest, but those in the west bear heavier crops. The richest pasture is afforded by the marshlands along the North Sea and by the plain of the lower Rhine, while the large moors of Westphalia and Hanover are of comparatively little value in this respect. The accompanying table shows the yield in tons of the principal crops in 1883, in which year, however, the returns were rather below the average:—

Province.	Rye.	Wheat.	Barley.	Oats.	Potatoes.	Hay.
East Prussia	330,565	88,585	71,987	211,139	586,640	600,231
West Prussia ..	269,030	88,608	69,600	119,710	888,953	320,984
Brandenburg ..	499,957	55,963	74,330	140,382	2,555,660	699,751
Pomerania	310,789	64,406	59,554	138,554	1,240,691	578,200
Posen	366,707	82,999	71,156	93,670	1,877,857	435,634
Silesia	481,706	177,681	174,671	330,810	1,929,859	703,269
Saxony	377,259	197,223	278,237	224,308	1,744,984	424,477
Schleswig-Holstein	181,793	75,049	60,775	196,731	224,869	375,469
Hanover	459,780	130,438	44,053	177,401	1,008,765	715,734
Westphalia	264,358	88,153	27,976	118,435	714,486	333,893
Hesse-Nassau ..	117,938	60,110	28,156	96,642	642,360	386,781
Rhenish Prussia	237,883	151,309	43,078	224,720	1,383,182	478,575
Hohenzollern ..	852	1,894	6,403	9,433	19,955	48,197
Total	3,898,617	1,257,718	1,010,036	2,125,435	14,263,211	6,101,125

About one-half of the cultivable soil is in the possession of owners with properties exceeding 180 acres in extent and averaging 860 acres, while one-half of the total number of owners occupy only one-fortieth of the entire area. The manner of distribution varies greatly in different parts of the kingdom, large properties prevailing in the less fertile regions in the east and peasant-holdings in the west. In the district of Stralsund the average number of land-owners for each German square mile is 100, while in the district of Wiesbaden it is ten times as high. In Silesia and Posen *latifundia* occupy nearly half the total area, though this disproportion is gradually disappearing there as elsewhere. As a general rule the best crops seem to be raised on the holdings of intermediate size.

Live Stock.—According to an enumeration made in 1883, Prussia Live contains 2,417,641 horses, 8,737,367 cattle, 14,752,328 sheep, stock 5,819,136 pigs, and 1,680,686 goats. The province of East Prussia, with the principal Government stud of Trakehnen, is the headquarters of horse-rearing, and contains the greatest number of horses both relatively (1 per 5 inhabitants) and absolutely (383,555). The horses bred there are generally suitable for the lighter kind of work only, and are in great request for military purposes. Horses of a stouter type are bred in Schleswig-Holstein and on the Rhine, but heavy draught horses have to be imported from France, Holland, Belgium, and Denmark. The best cattle are reared in the maritime provinces, and the highest proportion (65 per 100 inhabitants) is found in Schleswig-Holstein, whence, as well as from the marshy lowlands of Hanover, large numbers are exported to England. As a rule, however, the south German states are richer in cattle than Prussia. Prussia is one of the leading sheep-breeding countries of Europe, and much has been done to improve the race and increase the value of the flesh and wool. In Pomerania there are 170 sheep for every 100 inhabitants, and West Prussia and Posen also contain a high proportion. The total number of sheep in Prussia is, however, diminishing owing to the spread of agriculture and the increased importation of wool; in 1861 it was nearly 21 millions. Swine abound in the central provinces, and hams and sausages are largely exported from Westphalia, Hanover, and Saxony. Huge flocks of geese are reared in Pomerania, and bee-keeping is a profitable industry in Hanover, East and West Prussia, and the province of the Rhine.

Fisheries.—The fishery on the Baltic Sea and its haffs employs Fisheries about 15,000 men, and that on the North Sea about 2000 more. In the former the take consists mainly of herrings, flat fish, salmon, mackerel, and eels, while the chief objects of the latter are cod and oysters. Inland fishery has been encouraged by the foundation of numerous piscicultural establishments and by the enactment of close-time laws. Carp, perch, pike, and salmon, the latter especially in the Rhine, are the principal varieties; sturgeon are taken in the Elbe and Oder, and the lakes of East Prussia swarm with

bream and lampreys. Game of various kinds abounds in different parts of Prussia, and the lakes are frequented by large flocks of water-fowl.

Minerals.

Minerals.—Although it is obvious that the recent formations of the north German plain can boast of little or no mineral wealth, Prussia still takes rank among the great mining states. Its produce of coal and iron exceeds that of any country in Europe, except Great Britain; in the production of zinc it is the foremost country in the world; and its stores of salt are very considerable. In 1882 the total value of the mineral produce of Prussia was about 17½ millions sterling. About 370,000 persons are employed in its mines, the larger part of whom are engaged in the production of coal. For purposes of administration and supervision the entire country is divided into five mining districts (*Oberbergamtsbezirke*), the headquarters of which are Breslau, Halle, Klausthal (in the Harz), Dortmund, and Bonn.

The two great deposits of coal are in the basin of the Ruhr on the west, where about 20 million tons are raised annually, and in Upper Silesia, where the beds are still more extensive but the coal of a somewhat inferior quality. The greater part of the smaller but valuable coal-field of the Saar also belongs to Prussia, and other important beds occur in Lower Silesia, near Halle, and near Aix-la-Chapelle. In 1882 Prussia produced upwards of 47 million tons of coal, equal to 90 per cent. of the total yield of Germany, and double the output of 1869. Nearly three-fourths of this amount came from the western coal-fields and upwards of one-fourth from the coal-measures of Silesia. The total value was £11,636,250. Brown coal or lignite is found throughout the whole of Prussia, except in the extreme north-east and north-west, but occurs most plentifully in Saxony, Brandenburg, and north Silesia. In 1882 the produce was nearly 11 million tons, value 1½ millions sterling. Peat is cut in large quantities in Hanover, where 15 per cent. of the surface consists of moorland. Iron is found in all parts of Prussia, occurring in the form of bog-iron ore even in the northern lowlands. The richest districts are those of Coblenz in the province of the Rhine, Arnsberg in Westphalia, Oppeln in Silesia, and Wiesbaden. A valuable bed of magnetic-iron ore occurs in the Harz. In 1882 fully 4,000,000 tons of iron ore were raised in Prussia, valued at £1,415,950 and forming 70 per cent. of the total yield of Germany. The quantity of pig-iron smelted from these and from imported ores was 2,467,500 tons and its value £7,490,000. Prussia produces nearly the whole of the zinc of Germany, and Silesia three-fourths of that of Prussia; in 1882 the amount was 113,300 tons, valued at £1,795,000. The produce of lead in the same year was 88,300 tons, valued at £1,200,000 and found mainly in the valley of the Lahn near Coblenz, in Silesia, in the Harz, and in Hesse-Nassau. Copper was produced to the extent of 15,400 tons and the value of £1,025,000; five-sevenths were raised in Saxony, which includes some of the productive mines of the Harz. Silver and gold are extracted from the copper ore of Mansfeld in Saxony, and silver also from the lead ores of Silesia, Aix-la-Chapelle, Wiesbaden, and Arnsberg. In 1882 the value of the silver smelted out was £1,214,700, of gold only £9050. Salt also ranks high in importance among the mineral treasures of Prussia. In 1882 the total yield included 252,300 tons of boiled salt, 210,100 tons of rock-salt, and 85,400 tons of other salts, with a total value of £719,600. Brine springs occur throughout almost the whole kingdom, but by far the most productive provinces are Saxony and Hanover. Rock-salt is mined at Stassfurt in the province of Saxony, and in Posen. Chloride of potash and potassium salts are also extensively found in Saxony. The other mineral products include manganese, nickel, pyrites, cobalt, quicksilver, alum, gypsum, and sulphuric acid. Good building-stone is common throughout the country, marble is found in Silesia, and roofing slates in the Devonian formations of the Rhine and the Harz. Chalk pits and cliffs abound in the Island of Rügen. The amber of the Baltic coast is picked up on the beach after a storm, and is also found by digging and dredging. About 3000 persons are employed in the search, and in favourable seasons 3000 to 4000 cwts. are collected. Mineral springs are numerous among the mountains of Silesia, the Taunus, and the Eifel. The most generally known are those in the district of Wiesbaden, including Wiesbaden itself, Ems, Homburg, Schlangenbad, and Schwalbach.

Industries.

Industries.—Prussia now takes a high place among the manufacturing states of Europe, though the foundation of its industrial importance cannot be dated farther back than the reign of the Great Elector (1640-88). As a general rule, apart from a few of the larger towns, the busiest manufacturing centres are found on the lower slopes and outskirts of the mountainous districts, such as the Rhenish valleys, Lusatia, and the vicinity of the Silesian coal-fields. About 85 per cent. of the population are supported by industrial pursuits. The district of Düsseldorf is the busiest in Prussia, and Berlin and Elberfeld-Barmen are among the chief hives of industry on the Continent. The principal manufactured products are woollen, linen, cotton, silk, and iron goods.

The metallic industries, as might be expected, flourish chiefly in the neighbourhood of the coal-fields and have reached their highest

development in the district of the Ruhr. Steel is made most extensively in the districts of Arnsberg (Westphalia) and Düsseldorf; at Essen in the latter is Krupp's celebrated cannon-foundry, with 20,000 workmen. Small iron and steel goods also come chiefly from the Westphalian and Rhenish districts; and the cutlery of Solingen, the tools of Remscheid, and the needles of Aix-la-Chapelle enjoy a widespread reputation. Berlin is the chief seat of the manufacture of machinery and locomotives. Small arms are made at Suhl, Spandau, Potsdam, and Sömmerda (Erfurt). Articles in bronze, brass, and electro-plate are largely made at and exported from Berlin, Frankfort-on-the-Main, Iserlohn, and Altena, while gold and silver goods are produced chiefly at Berlin and Hanau.

The textile industries of Prussia are also important, employing 400,000 workpeople, though they do not rank in extent with those of Great Britain. Until recently the chief textile manufacture was linen, which was largely made by hand in Silesia, Westphalia, and Saxony. The domestic mode of manufacture has now to a great extent disappeared, but Westphalian and Silesian linens still maintain their reputation. The manufacture covers the home demand, but about one-third of the necessary flax and hemp has to be imported. Jute is made at Bielefeld and Bonn. The manufacture of cotton has of late made great progress, though it is not so important in Prussia as in the kingdom of Saxony and in Alsace. The chief centres of this branch of industry are Düsseldorf, Münster, Elberfeld-Barmen, Hanover, Breslau, and Liegnitz. About 65 per cent. of the woollen yarn of Germany is made in Prussia, and woollen cloth of good quality is produced in the province of the Rhine, Silesia, Brandenburg, and Saxony. The spinning and weaving of worsted and woollen cloth are also still carried on throughout the country as domestic industries, but not to such an extent as formerly. Wool and worsted yarn are imported from England and other countries, but the cloth manufactured is much in excess of the home demand and forms an important article of export. Carpets are made at Berlin and at Düren in the Rhine province. Silk is manufactured at Crefeld, Elberfeld-Barmen, and other places near the Rhine. Though hardly reaching the high standard of that of Lyons, Rhenish silk commands a good price, and is exported to England, America, Russia, and Austria.

Tobacco and cigars are largely manufactured at Berlin and numerous other towns, and to some extent wherever the tobacco plant is cultivated. The annual consumption of tobacco amounts to about 4 lb per head of population, or nearly thrice as much as in Great Britain; but the revenue derived from the tobacco excise, owing to the small impost on home-made tobacco, is not more than 6d. a head as compared with 5s. per head in England. A comparatively modern but very important branch of industry is the manufacture of sugar from the common beet. The great centre of this industry is the province of Saxony, which in 1882-83 contained nearly half the 280 sugar-works in the kingdom, the remainder being chiefly in Hanover and Silesia. Upwards of 600,000 tons of raw sugar and 160,000 tons of molasses are produced annually.¹ About 320 million gallons of beer are brewed in Prussia per annum and about 35 million more are imported from Bavaria and Bohemia; the consumption per head, amounting from 65 to 70 quarts, is about half of the English and one-fourth of the Bavarian rate. Wine-making, as already mentioned, is an important industry on the Rhine, and large quantities of spirits are distilled from potatoes in Brandenburg and the eastern provinces. The remaining industrial products of Prussia include chemicals, chiefly made in Saxony, Silesia, and the Rhenish province; dyes, at Elberfeld-Barmen and Crefeld; paper, in the districts of Aix-la-Chapelle, Arnsberg, and Liegnitz; glass ("Bohemian glass"), in Silesia; pianos, at Berlin, Breslau, Cassel, and Erfurt; and scientific instruments, at Berlin and Halle. The artistic furniture and porcelain of Berlin are characteristic specialities. In nearly every department there has been in recent years a steady advance both in quantity and quality.

Trade.—The commerce of Prussia is greatly facilitated by its central Trade position, which enables it to carry on a very extensive transit trade; but, as the returns are not separated from those of the other members of the Zollverein, it is impossible to do more than guess at its annual value. According to the *Almanach de Gotha*, the total value of the exports and imports of the German Customs Union in 1883 amounted to upwards of £380,000,000; and, to judge from the customs receipts, about three-fifths of this amount must be credited to Prussia. The chief imports are tea, coffee, sugar, and other colonial products, grain, wine, textile fabrics, fruit, petroleum, and manufactured articles of various kinds. Among the principal exports are grain, cattle, wine, potatoes, woollen and linen goods, hides and leather, chemicals, iron and steel wares, lead, and zinc. The export of grain to France and England has fallen off greatly of recent years, owing to the increasing demand at home. The inland trade is fostered by numerous fairs, the most important of which take place at the two Frankforts, Breslau, and Magdeburg. The money-markets of Berlin and Frankfort-on-the-Main are among the most influential in Europe.

¹ Over-production, stimulated by over-protection and the high bounty on exportation, produced a serious crisis in this industry in 1884.

In 1883 Prussia possessed upwards of three-fifths of the merchant ships of Germany, including 2586 sailing vessels and 229 steamers, manned by 17,315 men. Their burden, however, amounting to 449,391 tons, was little more than one-third of the whole, and was exceeded by that of Bremen and Hamburg taken together. None of the Prussian seaports vies with either Hamburg or Bremen; the largest is Stettin, which possesses a fleet of 40 steamers and 280 sailing ships. In 1881 the Prussian harbours were entered by 38,054 vessels of 3,483,545 tons burden, and cleared by 38,005 of 3,518,098 tons burden. The best seamen are furnished by the fishing population of Friesland or Frisia.

Com-
muni-
cation.

Communication.—With most internal means of communication Prussia is well provided. Almost none of its excellent highroads existed in the time of Frederick the Great, and many of them date from the Napoleonic era. The first Prussian railway was laid in 1838, but the railway system did not receive its full development until the events of 1866 removed the obstacles placed in the way by Hanover. Most of the lines were easy of construction, and absorbed comparatively little capital. The great majority were laid by private companies, and the Government confined itself to establishing lines in districts not likely to attract private capital. In 1879, however, a measure was passed authorizing the acquisition by the state of the private railways, and in 1884 nine-tenths of the 13,800 miles of railway in Prussia were in the hands of Government. The proportion of railway mileage in Prussia (5 miles per 10,000 inhabitants) is nearly as high as in Great Britain, but the traffic is much less. Thus in 1880-81 the Prussian railways carried only 124 million passengers, while the British lines conveyed 622 millions. The expenses swallowed up 56 per cent. of the gross receipts, or 4 per cent. more than those of England in the same year; but in the matter of railway accidents the comparison is more favourable to the Prussian railways, on which only 235 persons lost their lives as compared with about four times as many in Great Britain. The passenger traffic has not increased in proportion to the extension of the railway system and the growth of population, but the goods traffic has steadily advanced. The canal system of Prussia is little beyond its infancy, the total length of all the canals in the kingdom being only 1200 miles, a very small number as compared with either England or France. Among the most important are those uniting the Pregel with the Memel, and the Vistula with the Oder (*via* the Netze), and those bringing the Spree and Havel into communication with the Elbe on the one side and the Oder on the other. Canals uniting the Ems and the Rhine, the Ems and the Weser, and the Weser and the Elbe are still desiderata. On the other hand, Prussia has a large supply of navigable rivers.

Popu-
lation.

Population.—The last census of Prussia was taken in 1880, and the accompanying table summarizes the principal results then ascertained. The total population amounts to about 60 per cent. of that of the German empire.

Provinces.	Popu- lation.	Pop. per sq. mile.	Protest- ants.	Roman Catho- lics.	Other Chris- tian Sects.	Jews.	Others.
East Prussia	1,938,986	135	1,654,510	250,462	7,488	18,218	3,263
West Prussia	1,405,598	142	672,402	698,719	12,390	26,547	840
Brandenburg	3,899,155	220	3,182,486	181,781	6,087	66,245	2,556
Pomerania	1,540,084	182	1,498,980	28,877	1,962	18,886	1,879
Posen	1,708,997	152	682,499	1,112,020	451	56,609	1,818
Silesia	4,007,257	267	1,867,470	2,082,084	3,828	52,682	2,861
Saxony	2,812,007	237	2,154,655	145,518	3,894	6,700	1,740
Schleswig-Hol- stein	1,127,149	154	1,111,252	8,908	1,687	3,592	1,785
Hanover	2,120,168	142	1,842,186	258,824	2,738	14,790	1,680
Westphalia	2,043,442	262	949,644	1,070,212	2,614	18,810	2,162
Hesse-Nassau	1,554,876	256	1,087,901	420,206	3,078	41,816	1,880
Rhineland	4,074,000	390	1,077,178	2,944,186	7,015	48,694	1,932
Hohenzollern	67,624	158	2,221	64,491	8	771	138
	27,279,111	202	17,683,279	9,206,289	52,225	363,790	23,584

The following table shows the growth of the population since the death of Frederick, the first king of Prussia. The first trustworthy census of Prussia was taken in 1816; the earlier figures are only more or less reasonable estimates.

Date.	Population.	Area in square miles.	Average per square mile.
1713	1,781,000	43,425	39
1740	2,486,000	45,900	54
1786	5,430,000	75,220	72
1797	8,700,000	118,000	78
1816	10,849,081	108,100	95
1831	18,088,070	108,100	120
1864	19,254,649	108,480	177
1880	27,279,111	134,490	202.8

Between 1816 and 1881 the increase of the population of Prussia was about 30 per cent., and between 1831 and 1864 it was 46 per cent. Some districts have more than doubled their population since 1816, but the annual increment since 1866 has not exceeded 1 per cent., a fact due to the less rapid multiplication in the new pro-

vinces and the losses in the Franco-German War. The rate of increase in the latter part of the period 1867-84 has, however, been considerably more rapid than in the first half. The increase is entirely due to the surplus of births over deaths, as emigration is very much in excess of immigration. With the exception of Saxony and some of the smallest states, Prussia is increasing more rapidly in population than any other member of the German empire. Its rate of increase is fully twice that of France and about the same as that of the United Kingdom. The highest rate of increase in 1875-80 took place in Berlin (2.92 per annum) and Westphalia (1.39), the lowest in Hohenzollern (0.35) and East Prussia (0.82). The birth-rate, which for the entire country is 40 per 1000, is highest in West Prussia, Posen, and Westphalia and lowest in Schleswig-Holstein, Hanover, and Hesse-Nassau. The death-rate for the whole monarchy is about 27 per 1000, considerably higher than that of Great Britain, which is about 20 per 1000. Pomerania is remarkable for its low death-rate, West Prussia and Silesia for a high one. Both the birth-rate and the death-rate show a tendency to diminish. Of the births in 1882 8.11 per cent. were illegitimate, the proportion varying from 2.92 per cent. in Westphalia to 11 per cent. in Pomerania, and nearly 15 per cent. in Berlin. Between 1872 and 1880 the number of marriages diminished with almost unvarying steadiness; since 1880 it has risen again and now amounts to about 8 per 1000 inhabitants. An interesting feature is the large proportion of mixed confessional marriages, amounting as a rule to about 7 per cent. of the whole. Between 1871 and 1881 the annual emigration from Prussia amounted to 1.8 per 1000 inhabitants; in 1882 no fewer than 129,894, and in 1883 104,167 emigrants left the country by the German ports and Antwerp. The highest proportion of emigrants comes from Pomerania (5.6) and Posen (4.3), the lowest from Silesia, the Rhineland, and Saxony.

A study of the figures in the table given above will show that as a rule the density of population increases from north to south and from east to west. As might be expected, the thickest population is found in the mining and manufacturing district of the Rhine, which is closely followed by the coal-regions of Silesia and parts of Saxony and Westphalia. The proportion for the whole kingdom is about 200 per square mile, but in the district of Düsseldorf this figure rises to 750 and in the moorlands of Hanover it sinks to less than 50. According to the census of 1880, 57.4 per cent. of the population is rural, and 42.6 per cent. urban, *i.e.*, lives in communities of more than 2000 inhabitants. The relative proportions vary greatly in the different provinces, as much as 62 per cent. of the population living in towns in the Rhineland, and as little as 23 or 24 per cent. in East Prussia and Posen. About 17 per cent. of the population is absorbed by towns each with 20,000 inhabitants and upwards, while in Great Britain half the population is massed in the large towns and from 65 to 70 per cent. is urban. In Prussia also there is observable a strong movement towards concentration in towns, the annual rate of increase in the urban population being six times as great as that in the rural communities. In 1880 Prussia contained 24 towns each with upwards of 50,000 inhabitants, and 7 with upwards of 100,000 inhabitants, the corresponding numbers in Great Britain being 59 and 26. The following are the towns with upwards of 100,000 inhabitants each:—

Berlin	1,122,330	Königsberg	140,909
Breslau	272,912	Frankfort-on-the-Main	136,819
Hanover	145,227	Dantsic	108,551
Cologne	144,773		

Elberfeld and Barmen practically form one town with a population of 189,479; and Magdeburg, Düsseldorf, Stettin, and Altona are all above 90,000. The annual rate of suicides in Prussia is 18 to 20 per 100,000 inhabitants, a proportion seldom exceeded among European states. Divided according to nationalities, the present (1885) population of Prussia consists roughly of 24,000,000 Germans, 2,800,000 Poles in the eastern provinces, 150,000 Lithuanians in the north-east, 180,000 Danes in Schleswig-Holstein, 90,000 Wends in Brandenburg and Silesia, 60,000 Czechs in Silesia, and 12,000 Walloons near the Belgian frontier. In the rural districts of Posen and in parts of Silesia the Poles form the predominant element of the population.

In 1882 a census of occupations was taken in the German empire, the main results of which, so far as they relate to Prussia, are summarized in the following table. The figures include the wives, families, and other dependants of those actually engaged in the several occupations. The actual workers are about 11 millions in number and their dependants 16 millions.

Occupations.	Number of per- sons supported.	Percentage of total population.
1. Agriculture, forestry, and fishing	11,904,407	43
2. Industrial pursuits	9,398,750	35
3. Trade	2,725,344	10
4. Domestic servants (and general labourers)	690,892	2.4
5. Official, military, and professional classes	1,305,667	5
6. Persons not returned under any occupation	1,267,810	4.6

Religion. *Religious Statistics.*—According to the census returns of 1880 (see table, p. 16), 64·64 per cent. of the population of Prussia were Protestants, 34 per cent. Roman Catholics, and 1·33 Jews. A glance at a confessional map of Prussia shows that the centre of the kingdom is solidly Protestant, the proportion of Roman Catholics increasing as the eye travels east or west and reaching its maximum on the Rhine and in the Slavonic provinces. East Prussia, however, with the exception of Ermland, is Protestant. The Roman Catholics outnumber the Protestants in the provinces of the Rhine (3 to 1), Posen, Silesia, and West Prussia. All religious bodies are granted freedom of worship, and civil rights are not conditional upon religious confession.

The Evangelical or Protestant State Church of Prussia consists as it now stands of a union of the Lutherans and Calvinists, effected under royal pressure in 1817. According to the king this was not a fusion of two faiths but an external union for mutual admission to the Eucharist and for the convenience of using the same liturgy, prepared under the royal superintendence. Those who were unable from conscientious scruples to join the union became Separatist or Old Lutherans and Old Calvinists, but their numbers were and are insignificant. The king is "summus episcopus," or supreme pontiff of the church, and is represented in the exercise of his ecclesiastical functions by the minister of public worship and instruction. The highest authority for the ordinary management of the church is the "Oberkirchenrath," or supreme church council at Berlin, which acts through provincial consistories and superintendents appointed by the crown. Recent legislation has made an effort to encourage self-government and give a congregational character to the church by the granting of a presbyterial constitution, with parish, diocesan, provincial, and general synods. The clergy, of whom there were 9146 in 1880, are appointed by the crown, by the consistories, by private or municipal patronage, or by congregational election.

The hierarchy of the Roman Catholic Church in Prussia consists of two archbishops (Cologne, Gnesen-Posen) and ten bishops. The prince-bishop of Breslau and the bishops of Ermland, Hildesheim, and Osnabrück are directly under the pope, and the bishoprics of Fulda and Limburg are in the archiepiscopal diocese of Freiburg in Baden. The higher ecclesiastics receive payment from the state, and the annual appropriation appearing in the budget for the Roman Catholic Church is as high as that made for the State Church. All the Roman Catholic religious orders in Prussia have been suppressed except those mainly or wholly occupied with attendance on the sick.

The relations of the state with the dissenting Christian sects, such as the Baptists, Mennonites, and Moravian Brethren, are practically confined to granting them charters of incorporation which ensure them toleration. The Mennonites were formerly allowed to pay an extra tax in lieu of military service, which is inconsistent with their belief, but this privilege has been withdrawn. The Old Catholics number about 80,000, but do not seem to be increasing.

The Jews belong mainly to the urban population and form 20 to 30 per cent. of the inhabitants in some of the towns in the Slavonic provinces. They are especially prominent in commerce, finance, and on the stage, and also exercise great influence on the press. Perhaps the actual majority of newspaper editors and proprietors are of Jewish blood. The wave of social persecution to which they were subjected from 1876 onwards, especially in Berlin and Pomerania, has, to some extent at least, subsided.

Education. *Education.*—In Prussia education is looked upon as the province of the state, and the general level attained is very high. All schools, public and private, are under state supervision, and no one is allowed to exercise the profession of teacher until he has given satisfactory proof of his qualifications. At the head of the administration stands the minister of public instruction, to whom the universities are directly subordinate. The secondary schools are supervised by provincial "Schulcollegia," or school-boards, appointed by Government, while the management of the elementary and private schools falls within the jurisdiction of the ordinary "Regierungen," or department officials. This they carry out through qualified school-inspectors, frequently chosen from among the clergy. All children must attend school from their sixth to their fourteenth year.

The expenses of the primary schools (*Volksschulen*) are borne by the communes (*Gemeinden*, see *infra*), aided when necessary by subsidies from the state. The subjects of instruction are theology, reading, writing, spelling, arithmetic, the elements of geometry, history, geography, and natural science, singing, drawing, sewing, and gymnastics. The fees are extremely small, amounting in the rural districts to about 1d. per week, and in Berlin and some other towns they have been entirely done away with. In 1882 Prussia contained 33,040 primary schools with 59,917 teachers and 4,389,729 pupils. This shows an average of 159 children attending school out of every 1000 inhabitants, the proportion varying from 120 to 180 in the north-eastern provinces to 175 to 180 in Westphalia and Rhenish Prussia. The number of illiterate recruits among those called upon each year to serve in the army affords a good test of the universality of elementary education. In 1882-83 the proportion of

"Analphabæti," or men unable to read or write, among the recruits levied was only 2 per cent., the rate varying from 9·75 per cent. in Posen to 0·03 in Schleswig-Holstein, where there was only one illiterate recruit among 3662. The teachers for the elementary schools are trained in normal seminaries or colleges established and supervised by the state, and much has been done of late years to improve their position. In most of the larger towns the elementary schools are supplemented by middle schools (*Bürgerschulen*, *Stadtschulen*), which carry on the pupil to a somewhat more advanced stage, and are partly intended to draw off the unsuitable elements from the higher schools.

The secondary schools of Prussia may be roughly divided into classical and modern, though there are comparatively few in which Latin is quite omitted. The classical schools proper consist of *Gymnasia* and *Progymnasia*, the latter being simply gymnasias wanting the higher classes. In these boys are prepared for the universities and the learned professions, and the full course lasts for nine years. In the modern schools, which are divided in the same way into *Realgymnasia* and *Realprogymnasia*, and also have a nine years' course, Latin is taught, but not Greek, and greater stress is laid upon modern languages, mathematics, and natural science. The three lower classes are practically identical with those of the gymnasias, while in the upper classes the thoroughness of training is assimilated as closely as possible to that of the classical schools, though the subjects are somewhat altered. Ranking with the realgymnasias are the *Oberrealschulen*, which differ only in the fact that Latin is entirely omitted, and the time thus gained devoted to modern languages. The *Höhere* (or upper) *Bürgerschulen*, in which the course is six years, rank with the middle schools above mentioned, and are intended mainly for those boys who wish to enter business life immediately on leaving school. All these secondary schools possess the right of granting certificates entitling the holders, who must have attained a certain standing in the school, to serve in the army as one-year volunteers. The gymnasial "certificate of ripeness" (*Maturitätszeugniss*), indicating that the holder has passed satisfactorily through the highest class, enables a student to enroll himself in any faculty at the university, but that of the realgymnasium qualifies only for the general or "philosophical" faculty, and does not open the way to medicine, the church, or the bar. Considerable efforts are, however, now being made to have the realgymnasium certificate recognized as a sufficient qualification for the study of medicine at least. At any of these schools a thoroughly good education may be obtained at a cost seldom exceeding, in the highest classes, £5 per annum. The teachers are men of scholarship and ability, who have passed stringent Government examinations and been submitted to a year of probation. The great majority of the secondary schools have been established and endowed by municipal corporations. In 1881 Prussia contained 251 gymnasias, 64 progymnasias, 88 realgymnasias, 15 oberrealschulen, 27 realschulen, 47 höhere bürgerschulen, and 276 Höhere Töchtereschulen, or higher schools for girls. Besides these there are, of course, numerous commercial, technical, industrial, and other special schools.

Prussia possesses ten of the twenty German universities, attended by 12,800 students, or at the rate of one student for 2125 inhabitants. The largest Prussian university is that of Berlin, attended by more than 4000 students, while Breslau, Bonn, Göttingen, and Halle have each upwards of 1000. The oldest is the university of Greifswald, founded in 1456. Like the schools the universities are state institutions, and the professors are appointed and paid by Government, which also makes liberal annual grants for apparatus and equipment. The full obligatory course of study extends over three, and in the case of medicine four years. It is, however, not unusual for non-medical students also to spend four years at the university, and there is an agitation to make this compulsory. Students qualifying for a Prussian Government appointment are required to spend at least three terms or half-years (*Semester*) at a Prussian university.

Ranking with the universities are the large polytechnic colleges at Berlin, Hanover, and Aix-la-Chapelle, the mining academies of Berlin and Clausthal, and the academies of forestry at Eberswalde and Münden. Departments for the study of agriculture are attached to many of the universities. Music is taught at several conservatoria, the best known of which are at Berlin and Frankfurt-on-the-Main.

The science and art of Prussia find their most conspicuous external expression in the academies of science and art at Berlin, both founded by Frederick I.; and each town of any size throughout the kingdom has its antiquarian, artistic, and scientific societies. Recognized schools of painting exist at Berlin and Düsseldorf, and both these towns, as well as Cassel, contain excellent picture galleries. The scientific and archaeological collections of Berlin are also of great importance. Besides the university collections, there are numerous large public libraries, the chief of which is the royal library at Berlin (1,000,000 vols.).

Constitution.—The present form of the government of Prussia, consisting of an hereditary monarchy with two houses of parliament, is based upon a fundamental law promulgated in 1850, and subsequently somewhat modified by various enactments. The

constitution affirms the legal equality of all citizens in the eye of the law, provides for universal military service, and guarantees the personal liberty of the subject, the security of property, immunity from domiciliary visits, the inviolability of letters, toleration of religious sects, freedom of the press, the right of association and public meetings, and liberty of migration.

The monarchy is hereditary in the male line of the house of Hohenzollern, and follows the custom of primogeniture. The king alone exercises the executive power, but shares the legislative power with his parliament. He appoints and discharges the ministers and other officials of the crown, summons and dissolves parliament, possesses the right of pardon and mitigation of punishment, declares war and concludes peace, and grants orders and titles. He is held to be irresponsible for his public actions, and his decrees require the countersign of a minister, whose responsibility, however, is not very clearly defined. The national tradition and feeling lend the crown considerable power not formulated in the constitution, and the king is permitted to bring his personal influence to bear upon parliament in a way quite at variance with the English conception of a constitutional monarch. The annual civil list of the king of Prussia amounts to £600,000.

The legislative assembly consists of two chambers, which are convoked annually at the same time but meet separately. The right of proposing new measures belongs equally to the king and each of the chambers, but the consent of all three estates is necessary before a measure can pass into law. The chambers have control of the finances and possess the right of voting or refusing taxes. Financial questions are first discussed in the lower house, and the upper house can accept or reject the annual budget only *en bloc*. All measures are passed by an absolute majority, but those affecting the constitution must be submitted to a second vote after an interval of at least twenty-one days. Members may not be called to account for their parliamentary utterances except by the chamber in which they sit. No one may at the same time be a member of both chambers. The ministers of the crown have access to both chambers and may speak at any time, but they do not vote unless they are actually members. The general scheme of government, though constitutional, is not exactly "parliamentary" in the English sense of the word, as the ministers are independent of party and need not necessarily represent the opinions of the parliamentary majority. The *Herrenhaus*, or house of peers, contains two classes of members, the hereditary and non-hereditary. The former consists of the adult princes of the house of Hohenzollern, the mediatised princes and counts of the old imperial nobility, and the heads of the great territorial nobility. The non-hereditary members comprise life peers chosen by the king from the ranks of the rich landowners, manufacturers, and men of general eminence, and representatives "presented" for the king's approval by the landowners of the nine old provinces, by the larger towns, and by the universities. The *Abgeordnetenhaus*, or chamber of deputies, consists of 493 members, elected for periods of three years by indirect suffrage, exercised by all male citizens who have reached the age of twenty-five and have not forfeited their communal rights. The original electors are arranged in three classes, according to the rate of taxes paid by them, in such a way that the gross amount of taxation is equal in each class. The country is accordingly divided into electoral districts, with the electors grouped in three categories, each of which selects a *Wahlmann* or electoral proxy, who exercises the direct suffrage. Members of the lower house must be thirty years old and in full possession of their civic rights. They receive a daily allowance (*Diäten*) during the sitting of the house.

The king exercises his executive functions through an irresponsible *Staatsrath*, or privy council, revived in 1884 after thirty years of inactivity, and by a nominally responsible cabinet or council of ministers (*Staats-Ministerium*). The latter consists at present of the minister-president and of the ministers of foreign affairs, war, justice, finance, the interior, public worship and instruction, industry and commerce, public works, agriculture, domains, and forests. Ministers conduct the affairs of their special departments independently, but meet in council for the discussion of general questions. They represent the executive in the houses of parliament and introduce the measures proposed by the crown, but do not need to belong to either chamber. The affairs of the royal household and privy purse are entrusted to a special minister, who is not a member of the cabinet.

The Prussian governmental system is somewhat complicated by its relation to that of the empire. The king of Prussia is at the same time German emperor, and his prime minister is also the imperial chancellor. The ministries of war and foreign affairs practically coincide with those of the empire, and the customs-dues and the postal and telegraph service have also been transferred to the imperial Government. Prussia has only seventeen votes in the federal council, or less than a third of the total number, but its influence is practically assured by the fact that the small northern states almost invariably vote with it. To the reichstag Prussia sends more than half the members. The double parliamentary

system works in some respects inconveniently, as the reichstag and Prussian landtag are often in session at the same time and many persons are members of both. Where imperial and Prussian legislation come into conflict the latter must give way.

For administrative purposes Prussia is divided into *Provinzen* or provinces, *Regierungsbezirke* or governmental departments, *Kreise* or circles, and *Gemeinden* or communes. The city of Berlin and the district of Hohenzollern are not included in any province, and the larger towns usually form at once a commune and a circle (*Stadtkreis*). Recent legislation has aimed at the encouragement of local government and the decentralization of administrative authority by admitting lay or popularly elected members to a share in the administration alongside of the Government officials. Certain branches of administration, such as the care of roads and the poor, have been handed over entirely to local authorities, while a share is allowed them in all. As a general result it may be stated that the Prussian administrative system intervenes between the strongly centralized government of France and the liberty of local government enjoyed in England. In the province the Government is represented by the *Oberpräsident*, whose jurisdiction extends over all matters affecting more than one department. He is assisted by a council (*Provinzialrath*), consisting, besides himself as chairman, of one member appointed by Government and five members elected by the provincial committee (*Provinzialausschuss*). The latter forms the permanent executive of the provincial diet (*Provinzial-Landtag*), which consists of deputies elected by the kreise or circles, and forms the chief provincial organ of local government. The *regierungsbezirk* is solely a Government division and is only indirectly represented in the scheme of local administration. The Government authorities are the *Regierungs-Präsident*, who is at the head of the general internal administration of the department, and the *Regierung*, or Government board, which supervises ecclesiastical and educational affairs and exercises the function of the state in regard to the direct taxes and the domains and forests. The departmental president is also assisted by a *Bezirksrath* or district council, consisting of one official member and four others selected from inhabitants of the department by the provincial committee. The governmental official in the kreis (county, circle) is the *Landrath*, an office which existed in the Mark of Brandenburg as early as the 16th century. He is aided by the *Kreisausschuss*, or executive committee of the *Kreistag* (the diet of the circle), the members of which are elected by the rural and urban communes. The kreis is the smallest state division; the communes, divided into urban and rural, are left almost entirely to local government, though the chief officials must obtain the sanction of the central authority. In the rural communes the head magistrate, called a *Schulze* or *Dorfrichter*, is elected for six years and is assisted by assessors called *Schöffen*. The regulations for the government of towns still rest in great measure on the liberal reforms effected by Stein at the beginning of the century. The chief power rests in the hands of the *Stadtrath*, which consists of *Stadterordneten*, or town deputies elected by the citizens for six years. The practical executive is entrusted to the magistracy (*Magistrat*), which usually consists of a burgomaster, a deputy burgomaster (both paid officials), several unpaid members, and, where necessary, a few other paid members. The unpaid members hold office for six years; the paid members are elected for twelve years, and their election requires ratification from the state. The administrative system above described applies as yet in its full extent to about three-fourths of the provinces only, but is to be extended to the others in due course. Though in some respects rather cumbersome in its machinery, the system is on the whole found to work well and with economy.

In the seven eastern provinces, Westphalia, and part of the Rhenish province the common law of Prussia (*Landrecht*), codified in 1794, is in force, while the common law of the German empire, formed by an amalgamation of Roman, canon, and German law, prevails in the three new provinces and part of Pomerania. The Code Napoléon, however, still exists in the greater part of the Rhine district, and the commercial law has been consolidated in the German commercial code of 1861. A new penal code, promulgated in 1850, did away with the old patrimonial or seigniorial jurisdiction, and the administration of justice is now wholly in the hands of Government. The courts of lowest instance are the *Amtsgerichte*, in which sits a single judge, accompanied in penal cases by two *Schöffen* or lay assessors (a kind of jurymen, who vote with the judge). Cases of more importance are decided by the *Landgerichte* or county courts, in which the usual number of judges is three, while in important criminal cases a jury of twelve persons is generally empanelled. From the *landgerichte* appeals may be made to the *Oberlandesgerichte* or provincial courts. The oberlandesgericht at Berlin is named the *Kammergericht* and forms the final instance for summary convictions in Prussia, while all other cases may be taken to the supreme imperial court at Leipsic. The judges (*Richter*) are appointed and paid by the state, and hold office for life. After finishing his university career the student of law who wishes to become a judge or to practise as qualified counsel (*Rechtsanwalt*, barrister and solicitor in one) passes a Government examina-

tion and becomes a *Referendarius*. He then spends at least four years in the practical work of his profession, after which he passes a second examination, and, if he has chosen the bench instead of the bar, becomes an *Assessor* and is eligible for the position of judge. A lawyer who has passed the necessary examinations may at any time quit the bar for the bench, and a judge is also at liberty to resign his position and enter upon private practice. In all criminal cases the prosecution is undertaken by Government, which acts through *Staatsanwälte*, or directors of prosecutions, in the pay of the state.

Finances. *Finances.*—The finances of the Prussian Government are well managed, and a deficit is now a rare occurrence. The expenditure has been considerably relieved by the transference of the cost of the army and navy to the imperial treasury, while on the other hand the customs-dues and several excise duties have been relinquished to the empire and an annual "matricular" contribution paid towards its expenses. The budget is voted annually by the *abgeordnetenhaus*; the following table is an abstract of that for 1884-85:—

Revenue.	Expenditure.
Direct taxes £7,296,286	Expenses of collection and management £28,284,532
Indirect taxes 4,586,510	Civil list 225,000
State lottery 201,700	Interest and management of public debt 7,877,816
Marine institute and mint 128,225	Houses of parliament 68,682
Domains and forests 8,805,857	Apanages, annuities, and indemnities 3,262,017
Mines and salt-works 5,120,752	Matricular contribution to the German empire 2,038,460
State railways 28,798,897	Administrative expenditure 12,632,830
General financial administration 5,583,368	Justice 2,017,020
Administrative revenues 1,160,259	Education 1,644,670
	Religion 593,333
	Ministry of the interior 2,077,510
	Occasional and extraordinary expenses 2,341,681
Total £56,680,818	Total £56,680,818

Perhaps the only item requiring explanation in the above summary is the general financial administration under the head of revenue; this includes advances from the surplus in the treasury, Prussia's proportion of the profits of the imperial customs and excises, repayments, interest, and other miscellaneous sources of revenue. The extraordinary expenses included upwards of £450,000 for railways and £750,000 for public works. The total expenditure is rather more than £2 per head of population, while in the United Kingdom it is about £2.10s. Between 1821 and 1844 the rate in Prussia was 11s. 6d. per head, and even in 1858 it was only 21s. 8d. The incidence of direct taxation in Prussia is also less than in Great Britain, the respective figures being 5s. 3d. and 7s. per head. The principal direct imposts are the income-tax, which brings in 40 per cent. of the whole, the land-tax producing 37 per cent., and the house-tax producing 19 per cent. The proceeds of the income-tax amount to about 1s. 2d. per head, as compared with 6s. per head in Great Britain (in 1881). The comparative insignificance of the sum raised by indirect taxation is mainly due to the above-noted fact that the customs-dues and the most important excise duties have been made over to the imperial exchequer. In the preliminary estimates for 1885-86 the receipts and expenditure are balanced at £62,886,250.

Local taxation in Prussia is often very high. The state income-tax is limited to 3 per cent. of the assessed income, but the communes and towns are allowed to make an arbitrary addition for local purposes, sometimes amounting to twice or thrice the sum paid to the state. This is chiefly owing to the fact that the state reserved for itself all taxation on real property, while imposing on the communes the principal share in maintaining the expensive system of public schools. Incomes below £45 (900 marks) are not now taxed, but this exemption is of very recent origin. A few facts from the statistics of taxation and allied subjects may be of interest as affording some slight index to Prussia's growth in prosperity. Between 1864 and 1878 the entire capital subject to income-tax increased from 24 to 48 marks per head of population, while the proportionate number of those liable to the tax had increased by about 75 per cent. It has also been computed that the average income per head increased between 1872 and 1881 by 15 marks, equivalent to a rise of 5 per cent.; that of Great Britain increased in the same period by 88s., or 15 per cent. Of all the payers of income-tax in 1872-81 only 0.10 per cent. had incomes of or above £1000, while 43 per cent. had not more than £25 and 52 per cent. between £25 and £100. Between 1867 and 1880 the proceeds of the house-tax increased by over 100 per cent. It now averages 1s. per head, varying from 6d. in country districts up to 5s. or 5s. 6d. in Berlin, Frankfurt-on-the-Main, and Cologne. In 1875 the number of depositors in savings banks was 86 per 1000 inhabitants, and by 1880 the number had risen to 107. The sum deposited amounted to £79,648,400, equivalent to 58s. per head of population. At the same date Austria alone of European powers had a higher proportion (67s.), while in Great Britain the sum was 44s. and in France 27s.

The public debt of Prussia in 1884 amounted to 3,345,097,438

marks, or £167,254,872. This is equivalent to about £6 per head of population, as compared with three and a half times as much in England. The annual charge for interest on the debt is 6s. 8d. per head in Prussia and 16s. 2d. in England. Between the end of the struggle with Napoleon and 1848 the debt was considerably reduced; since 1848 it has steadily increased. It is, however, admirably secured, and a great part of it was incurred in the construction and acquisition of railways, the clear income from which covers the annual charges on the entire debt. The various branches of the debt are being gradually united in a consolidated fund, bearing interest at the rate of 4 per cent.

Army and Navy.—The Prussian army now forms about 75 per cent. of that of the German empire, of which it also furnished the model. (See GERMANY.) The first attempt at the foundation of a navy was made by the Great Elector, who established a small fleet of eight or ten vessels. This, however, was completely neglected by his successors, and the present marine establishment is of quite recent origin. The present imperial navy is simply the Prussian navy under a different name. (See GERMANY.)

Bibliography.—The statistical facts in the foregoing article have been mainly drawn from the *Jahrbuch für die amtliche Statistik des preussischen Staats*, the *Statistisches Jahrbuch für das deutsche Reich*, and other publications of the statistical offices of Prussia and Germany. Good general accounts of the natural, social, and political features of the country are given in Eiselein's *Der preussische Staat* (Berlin, 1862) and in Daniel's *Handbuch der Geographie* (5th ed., 1881 sq.). The Prussian constitution and administrative system are concisely described in the *Handbuch der Verfassung und Verwaltung in Preussen*, by Graf Hue de Grais, and are treated at length in Von Ronne's *Staatsrecht der preussischen Monarchie* (4th ed., 1881-84). For English readers the most interesting introduction to Prussian history is perhaps still to be found in the first part of Carlyle's *Frederick the Great*, the not invariably unprejudiced views of which may be corrected by Professor Tuttle's *History of Prussia to the Accession of Frederick the Great* (Boston, 1884). The latter admirable little work is, indeed, almost indispensable to every English student of Prussian constitutional history. Professor Seeley's *Life of Stein* (London, 1879) contains an excellent account of Prussia in the Napoleonic period, especially with regard to the important internal reforms carried out at the beginning of the present century. Among the numerous German histories of Prussia two of the best are Droysen's *Geschichte der preussischen Politik* and Ranke's *Zwölf Bücher preussischer Geschichte*; the former is authoritative from the writer's copious use of the Prussian archives, but the latter is less diffuse and more interesting. Other standard works are those of Stenzel, Pauli, Riedel, and Lenzolle, while among shorter histories may be mentioned the manual of F. Voigt. Fix's *Territorial-Geschichte des brandenburgisch-preussischen Staates*, with ten historical maps, is a convenient sketch of the territorial growth of Prussia. The period since the death of Frederick the Great is treated in Förster's *Neuere und neueste preussische Geschichte* and in Reimann's *Neuere Geschichte des preussischen Staats* (1882 sq.). The history of the present century is perhaps most fully given in Treitschke's *Deutsche Geschichte im neunzehnten Jahrhundert* (1879 sq.). Until recently the standard work on the history of Prussia proper was that of Johannes Voigt, but this is now being superseded by Lohmeyer's *Geschichte von Ost u. West Preussen* (1881 sq.). The latter forms one of an admirable series of provincial histories in course of publication by Perthes of Gotha. The development of the Prussian bureaucracy is traced in Isaacsohn's *Geschichte des preussischen Beamtenthums* (1870-84). Several points are most satisfactorily handled in the numerous monographs on special periods, the lives of kings and statesmen, and the like. (J. F. M.)

PRUSSIA, in the original and narrower sense of the word, is a district in the north-eastern corner of the modern kingdom of the same name, stretching along the Baltic coast for about 220 miles, and occupying an area of upwards of 24,000 square miles. The eastern part of this territory formed the duchy of Prussia, which was acquired by the electors of Brandenburg in 1618, and furnished them with their regal title. The western part, which had been severed from the eastern half and assigned to Poland in 1466, was not annexed to Prussia until the partition of Poland in 1772, while the towns of Dantsic and Thorn remained Polish down to 1793. In spite of the contrast between the political and social conditions of the two districts, arising from the difference of their history, they were united in 1824 to form a single province. But, as might have been expected, the union did not work well, and it was dissolved in 1878, giving place to the modern provinces of East and West Prussia. The early history of the whole district is related under the kingdom of PRUSSIA (above) and TEUTONIC ORDER, while the former article also gives (p. 14) some statistics as to the produce of the two provinces.¹

EAST PRUSSIA (*Ostpreussen*), the larger of the two provinces, has an area of 14,280 square miles, and is bounded by the Baltic Sea, Russia, and West Prussia. It shares in the general characteristics of the great north German plain, but, though low, its surface is by no means absolutely flat, as the southern half is traversed by a low ridge or plateau (comp. GERMANY), which attains a height of 1025 feet at a point near the western boundary of the province. This plateau, here named the Prussian Seenplatte, is thickly sprinkled with small lakes, among which is the Spirding See, 46 square miles in extent and the largest inland lake in the Prussian monarchy.

¹ Compare Lohmeyer's *Geschichte von Ost u. West Preussen* (1881, sq.).

The coast is lined with low dunes or sandhills, in front of which lie the large littoral lakes or lagoons named the Frische Haff and the Kurische Haff. (See GERMANY.) The first of these receives the waters of the Nogat and the Pregel, and the other those of the Memel or Niemen. East Prussia is the coldest part of Germany, its mean annual temperature being about 44° Fahr., while the mean January temperature of Tilsit is only 25°. The rainfall is 24 inches per annum. About half the province is under cultivation; 18 per cent. is occupied by forests, and 28 per cent. by meadows and pastures. The most fertile soil is found in the valleys of the Pregel and the Memel, but the southern slopes of the Baltic plateau and the district to the north of the Memel consist in great part of sterile moor, sand, and bog. The chief crops are rye, oats, and potatoes, while flax is cultivated in the district of Ermland, between the Passarge and the upper Alle. East Prussia is the headquarters of the horse-breeding of the country and contains the principal Government stud of Trakehnen; numerous cattle are also fattened on the rich pastures of the river-valleys. The extensive woods in the south part of the province harbour a few wolves and lynxes, and the elk is still preserved in the forest of Ibenhorst, near the Kurische Haff. The fisheries in the lakes and haffs are of some importance; but the only mineral product of note is amber, which is found in the peninsula of Samland in greater abundance than in any other part of the world. Manufactures are almost confined to the principal towns, though linen-weaving is practised as a domestic industry. Commerce is facilitated by canals connecting the Memel and Pregel and also the principal lakes, but is somewhat hampered by the heavy dues exacted at the Russian frontier. A brisk foreign trade is carried on through the seaports of Königsberg (140,909), the capital of the province, and Memel (19,660), the exports consisting mainly of timber and grain. In 1880 the population of East Prussia was 1,933,936, including 1,654,510 Protestants, 250,462 Roman Catholics, and 18,218 Jews. The Roman Catholics are mainly confined to the district of Ermland, in which the ordinary proportions of the confessions are completely reversed. The bulk of the inhabitants are of German blood, but there are 400,000 Protestant Poles (Masurians or Masovians) in the south part of the province, and 150,000 Lithuanians in the north. As in other provinces where the Polish element is strong, East Prussia is below the general average of the kingdom in education; in 1883 fully 5½ per cent. of its recruits were unable to read or write. There is a university at Königsberg.

WEST PRUSSIA (*Westpreussen*), with an area of 9850 square miles, is bounded by the Baltic, East Prussia, Poland, Posen, Brandenburg, and Pomerania. It resembles East Prussia in its physical characteristics, but its fertility is somewhat greater and its climate not quite so harsh. The Baltic plateau traverses the province from east to west, reaching its culminating point in the Thurmberg (1090 feet), near Dantsic. Near the middle of the province the range is interrupted by the valley of the Vistula, beyond which it trends to the north and approaches the coast. The lakes of West Prussia are nearly as numerous but not so large as those of the sister province. The natural products are similar, and the manufactures are also almost confined to the large towns. The cultivation of the common beet, for the production of sugar, has been introduced, and several sugar refineries have been erected. The valley of the Vistula, particularly the rich lowlands (*Werder*) of the delta, are very fertile, producing good crops of wheat and pasturing large herds of horses, cattle, and sheep. The population in 1880 was 1,405,898, consisting in almost equal proportions of Roman Catholics and Protestants; there were 26,547 Jews and 490,000 Poles. The percentage of illiterate recruits in 1882 was still higher than in East Prussia (7·97), but not so high as in Posen (9·75). The capital and principal town is Dantsic (108,551), while Elbing (35,842) and Thorn (20,617) also carry on a considerable trade.

PRUSSIA, RHENISH (German, *Rheinpreussen*, *Rhein-provinz*, *Rheinland*), the most westerly province of the kingdom of Prussia, is bounded on the N. by Holland, on the E. by Westphalia, Hesse-Nassau, and Hesse-Darmstadt, on the S.E. by the Rhenish Palatinate, on the S. and S.W. by Lorraine, and on the W. by Luxemburg, Belgium, and Holland. The small district of Wetzlar in the midst of the province of Hesse also belongs to Rhenish Prussia, which, on the other hand, surrounds the Oldenburg principality of Birkenfeld. The extent of the province is 10,420 square miles, or nearly twice that of the kingdom of Saxony; its extreme length, from north to south, is nearly 200 miles and its greatest breadth is just under 90. It includes about 200 miles of the course of the Rhine, which forms the eastern frontier of the province from Bingen to Coblenz and then flows through it in a north-westerly direction.

The southern and larger half of Rhenish Prussia, belonging geologically to the Devonian formations of the lower Rhine, is hilly. On the left bank are the elevated plateaus of the Hunsrück and the Eifel, separated from each other by the deep valley of the Moselle, while on the right bank are the spurs of the Westerwald and the Sauerland, the former reaching the river in the picturesque group known as the Seven Mountains. The highest hill in the province is the Walderbeskopf (2670 feet) in the Hochwald, and there are several other summits above 2000 feet on the left bank, while on the right there are few which attain a height of 1600 feet. Most of the hills are covered with trees, but the Eifel is a barren and bleak plateau, with numerous traces of volcanic agency, and is continued towards the north-west by the moorlands of the Hohe Venn. To the north of a line drawn from Aix-la-Chapelle to Bonn the province is flat, and marshy districts occur near the Dutch frontier. The climate varies considerably with the configuration of the surface. That of the northern lowlands and of the sheltered valleys is the mildest and most equable in Prussia, with a mean annual temperature of 50° Fahr., while on the hills of the Eifel the mean does not exceed 44°. The annual rainfall varies in the different districts from 18 to 32 inches. Almost the whole province belongs to the basin of the Rhine, but a small district in the north-west is drained by affluents of the Meuse. Of the numerous tributaries which join the Rhine within the province, the most important are the Nahe, the Moselle, and the Ahr on the left bank, and the Sieg, the Wupper, the Ruhr, and the Lippe on the right. The only lake of any size is the Laacher See, the largest of the "maare" or extinct crater lakes of the Eifel.

Of the total area of the Rhenish province about 46·5 per cent. is occupied by arable land, 17 per cent. by meadows and pastures, and 31 per cent. by forests. Little except oats and potatoes can be raised on the high-lying plateaus in the south of the province, but the river-valleys and the northern lowlands are extremely fertile. The great bulk of the soil is in the hands of small proprietors, and this is alleged to have had the effect of somewhat retarding the progress of scientific agriculture. The usual cereal crops are, however, all grown with success, and tobacco, hops, flax, rape, hemp, and beetroot (for sugar) are cultivated for commercial purposes. Large quantities of fruit are also produced. The vine-culture occupies a space of 30,000 acres, about half of which are in the valley of the Moselle, a third in that of the Rhine itself, and the rest mainly on the Nahe and the Ahr. The choicest varieties of Rhine wine, however, such as Johannisberger and Steinberger, are produced higher up the river, beyond the limits of the Rhenish province. In the hilly districts more than half the surface is sometimes occupied by forests, and large plantations of oak are formed for the use of the bark in tanning. Considerable herds of cattle are reared on the rich pastures of the lower Rhine, but the number of sheep in the province is comparatively small, and is, indeed, not greatly in excess of that of the goats. The wooded hills are well stocked with deer, and a stray wolf occasionally finds its way from the forests of the Ardennes into those of the Hunsrück. The salmon fishery of the Rhine is very productive and trout abound in the mountain streams. (Compare the agricultural tables under PRUSSIA, p. 14 *supra*.)

The great mineral wealth of the Rhenish province probably furnishes its most substantial claim to the title of the "richest jewel in the crown of Prussia." Besides parts of the Carboniferous measures of the Saar and the Ruhr, it also contains important deposits of coal near Aix-la-Chapelle. Iron occurs abundantly near Coblenz, the Bleiberg in the Eifel possesses an apparently inex-

haustible supply of lead, and zinc is found near Cologne and Aix-la-Chapelle. The mineral products of the district also include lignite, copper, manganese, vitriol, lime, gypsum, volcanic stones (used for mill-stones), and slates. In 1882 the total value of the minerals raised in the province was £5,460,000, or nearly one-third of the produce of Prussia; by far the most important item is coal, the output of which was upwards of 15,000,000 tons, valued at £4,400,000. Of the numerous mineral springs the best known are those of Aix-la-Chapelle and Kreuznach.

The mineral resources of Rhenish Prussia, coupled with its favourable situation and the facilities of transit afforded by its great waterway, have made it the most important manufacturing district in Germany. The industry is mainly concentrated round two chief centres, Aix-la-Chapelle and Düsseldorf (with the valley of the Wupper), while there are naturally few manufactures in the hilly districts of the south or the marshy flats of the north. In the forefront stand the metallic industries, the total produce of which was valued in 1882 at £5,200,000. The foundries produced upwards of a million tons of iron, besides zinc, lead, copper, and other metals. The largest iron and steel works are at Essen (including Krupp's cannon-foundry), Oberhausen, Duisburg, Düsseldorf, and Cologne, while cutlery and other small metallic wares are extensively made at Solingen, Remscheid, and Aix-la-Chapelle. The cloth of Aix-la-Chapelle and the silk of Crefeld form important articles of export. The chief industries of Elberfeld-Barmen and the valley of the Wupper are cotton-weaving, calico-printing, and the manufacture of turkey red and other dyes. Linen is largely made at Gladbach, leather at Malmédy, glass in the Saar district, and beet-root sugar near Cologne. Though the Rhineland is *par excellence* the country of the vine, no less than 52,000,000 gallons of beer were brewed in the province in 1882-83, equivalent to an annual consumption of fifty-one quarts per head of population; distilleries are also numerous, and large quantities of sparkling Moselle are made at Coblenz, chiefly for exportation to England. Commerce is greatly aided by the navigable rivers, a very extensive network of railways, and the excellent roads constructed during the French régime. The imports consist mainly of raw material for working up in the factories of the district, while the principal exports are coal, fruit, wine, dyes, cloth, silk, and other manufactured articles of various descriptions.

The population of Rhenish Prussia in 1880 was 4,074,000, including 2,944,186 Roman Catholics, 1,077,173 Protestants, and 43,694 Jews. The Roman Catholics muster strongest on the left bank, while on the right bank about half the population is Protestant. The distribution of the confessions is, however, somewhat sporadic, owing to the varied histories of the constituent parts of the province. The great bulk of the population is of Teutonic stock, and about a quarter of a million are of Flemish blood. On the north-west frontier reside about 12,000 Walloons, who speak French or Walloon as their native tongue. The Rhine province is the most thickly populated part of Prussia, the general average being 390 persons per square mile, while in the government district of Düsseldorf the proportion rises to 754. The province contains a greater number of large towns than any other province in Prussia, and 62·5 of the population is returned as urban. Upwards of half the population are supported by industrial and commercial pursuits, and barely a quarter by agriculture. There is a university of good standing at Bonn, and the success of the elementary education is borne witness to by the fact that in 1883 only 0·19 per cent. of the Rhenish recruits were unable to read and write. For purposes of administration the province is divided into the five districts

of Coblenz, Düsseldorf, Cologne, Aix-la-Chapelle, and Treves; Coblenz is the official capital, though Cologne is the largest and most important town. In the greater part of the province the Code Napoléon, introduced under the French régime, is still in force. Being a frontier province the Rhineland is strongly garrisoned, and the Rhine is guarded by the four strong fortresses of Cologne with Deutz, Coblenz with Ehrenbreitstein, Wesel, and Saarlouis. In the Prussian parliament the province of the Rhine is represented by twenty-seven members in the upper house and eighty-two in the lower.

History.—The present province of Rhenish Prussia was formed in 1815 out of the duchies of Cleves, Berg, Upper Guelders, and Jülich, the ecclesiastical principalities of Treves and Cologne, the free cities of Aix-la-Chapelle and Cologne, and nearly a hundred small independent lordships, knightships, and abbeys. It is therefore manifestly impracticable to give more than a broad general sketch of the historical development of a region of which the component parts have had so little of their past in common. At the earliest historical period we find the territories between the Ardennes and the Rhine occupied by the Treviri, Eburones, and other Celtic tribes, who, however, were all more or less modified and influenced by their Teutonic neighbours. On the right bank of the Rhine, between the Main and the Lahn, were the settlements of the Mattiaci, a branch of the Germanic Chatti, while farther to the north were the Usipetes and Tenceteri. Julius Caesar conquered the tribes on the left bank and Augustus established numerous fortified posts on the Rhine, but the Romans never succeeded in gaining a firm footing on the right bank. Under the Romans the districts to the west of the Rhine, forming parts of the provinces of Belgica Prima, Germania Superior, and Germania Inferior, enjoyed great prosperity and reached a high degree of civilization. Several Roman emperors resided and issued their edicts at Treves, the capital of Belgica Prima, and the important Roman remains in this city as well as in other parts of the province give an idea of the material benefits the territory derived from their dominion. As the power of the Roman empire declined the Franks pushed forward along both banks of the Rhine, and by the end of the 5th century had regained all the lands that had formerly been under Teutonic influence. The German conquerors of the Rhenish districts were singularly little affected by the culture of the provincials they subdued, and all traces of Roman civilization were submerged in a new flood of paganism. By the 8th century the Frankish dominion was firmly established in central Germany and northern Gaul; and under the Carolingian monarchs the Rhineland, and especially Aix-la-Chapelle, plays a rôle of considerable prominence. On the division of the Carolingian realm the part of the Rhenish province to the east of the river fell to the share of Germany, while that to the west remained with the evanescent middle kingdom of Lotharingia. By the time of Otho I. (936-973) both banks of the Rhine had become German, and the Rhenish territory was divided between the duchies of Upper and Lower Lorraine, the one on the Moselle and the other on the Meuse. Subsequently, as the central power of the German sovereign became weakened, the Rhineland followed the general tendency and split up into numerous small independent principalities, each with its separate vicissitudes and special chronicles. The old Lotharingian divisions passed wholly out of use, and the name of Lorraine became restricted to the district that still bears it. In spite of its dismembered condition, and the sufferings it underwent at the hands of its French neighbours in various periods of warfare, the Rhenish territory prospered greatly and stood in the foremost rank of German culture and progress. Aix-la-Chapelle was fixed upon as the place of coronation of the German emperors, and the ecclesiastical principalities of the Rhine bulk largely in German history. Prussia first set foot on the Rhine in 1609 by the joint occupation of Cleves; and about a century later Upper Guelders and Mörs also became Prussian. At the peace of Basel in 1795 the whole of the left bank of the Rhine was resigned to France, and in 1806 the Rhenish princes all joined the Confederation of the Rhine. The congress of Vienna assigned the whole of the lower Rhenish districts to Prussia, which had the tact to leave them in undisturbed possession of the liberal institutions they had become accustomed to under the republican rule of the French. (Compare RHINE.) (J. F. M.)

PRUSSIAN BLUE. See PRUSSIC ACID (p. 24 *infra*).

PRUSSIC ACID, the familiar name for a dangerously poisonous, though chemically feeble, acid, known scientifically as "hydrocyanic acid," or "cyanide of hydrogen," is here taken as a convenient heading under which to treat of cyanides generally. This generic term (from *κύανος*, blue) is not meant to hint at any generic property; it is due simply to the fact that all cyanides, in an historical sense,

are derivatives of a blue pigment which was discovered accidentally by Diesbach, a Berlin colourmaker, about the beginning of the 18th century.

The foundations of our present knowledge of cyanides were laid by Scheele (1783), whose discoveries were subsequently (from 1811) confirmed and supplemented, chiefly in the sense of quantitative determinations, by Gay-Lussac. Although we have no space for further historical notes, we must not omit to state that Gay-Lussac, as one result of his work, conceived and introduced into chemistry the notion of the "compound radical," having shown that prussic acid and its salts are related to the group NC in precisely the same way as chlorides are to chlorine, or sulphides to sulphur. This idea, in his own eyes and in those of his contemporaries, was greatly fortified by his success in even isolating his "cyanogène" as a substance.

In preparing cyanogen or cyanides in the laboratory the operator now always starts from prussiate of potash, with which, accordingly, we begin.

Prussiate of Potash, $(\text{NC})_2\text{Fe.K}_4 + 3\text{H}_2\text{O}$ (syn. ferrocyanide of potassium; Germ. *Blutlaugensalz*).—This salt is being produced industrially from animal refuse (hide and horn clippings, old shoes, blood solids, &c.), carbonate of potash, and iron filings or borings as raw materials. The carbonate of potash is fused at a red heat in an iron pear-shaped vessel suspended within a furnace, or on the cupel-shaped sole of a reverberatory furnace, and the animal matter, which should be as dry as possible, is then introduced in instalments along with the iron. The fusion is continued as long as inflammable gases are going off; then the still fluid mass is ladled out and allowed to cool, when it hardens into a black stone-like body known to the manufacturer as "metal." When the broken-up metal is digested with water in an iron vessel prussiate of potash passes into solution, while a black residue of charcoal, metallic iron, sulphide of iron, &c., remains. The clarified solution, after sufficient concentration in the heat, deposits on cooling part of its prussiate in lemon-yellow quadratic crystals (generally truncated octahedra), which are purified by recrystallization. The last mother-liquors furnish an impure green salt, which is added to a fresh fuse and so utilized.

In former times it was believed that the prussiate was produced during the fusion process, and in the subsequent process of lixiviation simply passed into solution, until Liebig showed that this view was untenable. The fuse cannot contain ready-formed prussiate, because this salt at a red heat breaks up with formation of a residue of carbide of iron and cyanide of potassium. The metal in fact when treated with dilute alcohol gives up to it plain cyanide of potassium, and the fully exhausted residue yields no prussiate on treatment with water. The prussiate accordingly must be produced during the process of lixiviation by the action of the cyanide of potassium on some ferrous compound in the metal. Liebig thought that it was partly the metallic iron, partly the sulphide of iron present in the metal, which effected the conversion. According to more recent researches a double sulphide, $\text{K}_2\text{S} + \text{Fe}_2\text{S}_3$, which is always produced during the fusion (from the reagents proper and the sulphur of the organic matter and that of the sulphate of potash present in the carbonate as an impurity), plays this important part. The double sulphide by the action of water breaks up into alkaline sulphide, sulphide of iron (FeS), and sulphur. This sulphide of iron is of a peculiar kind; it does what *ordinary* FeS does not effect, readily at least: it converts the cyanide into prussiate, thus, $6\text{NC.K} + \text{FeS} = \text{K}_2\text{S} + (\text{NC})_2\text{Fe.K}_4$, while the eliminated sulphur of the original Fe_2S_3 unites with another part of the cyanide of potassium into sulphocyanate, $\text{S} + \text{NCK} = \text{SNC.K}$, which latter salt is thus unavoidably produced as a (rather inconvenient) by-product. Pure prussiate of potash has the specific gravity 1.83; it is permanent in the air. It loses its water, part at 60° C., the rest at 100° C., but very slowly. The anhydrous salt is a white powder. The crystals dissolve in four parts of cold and in two parts of boiling water. It is insoluble in, and not dehydrated by, alcohol.

Prussiate of potash has the composition of a double salt, $\text{Fe}(\text{NC})_2 + 4\text{KNC}$, but the idea that it contains these two binary cyanides is entirely at variance with its reactions. Cyanide of potassium is readily decomposed by even the feeblest acids, and to some extent even by water, with elimination of hydrocyanic acid, and on this account perhaps is intensely poisonous. A solution of the prussiate remains absolutely unchanged on evaporation, and the action on it even of strong acids in the cold results in the formation of the hydrogen salt, $(\text{NC})_2\text{Fe.H}_2$, which is decomposed, it is true, but only when the mixture is heated, with evolution of hydrocyanic acid. It is not poisonous. Its solution when mixed with nitrate of silver does not give a precipitate of cyanide of silver, NC.Ag , and a solution of the two nitrates, but yields a unitary pre-

cipitate of the composition $(\text{NC})_2\text{Fe.Ag}_2$, which contains all the iron; only nitrate of potassium passes into solution. Other heavy metallic salts behave similarly. On the strength of these considerations chemists, following the lead of Liebig, view prussiate as a binary compound of potassium, K_4 , with a complex radical, $\text{N}_6\text{C}_6\text{Fe}$, "ferrocyanogen."

Hydrocyanic Acid, NC.H .—This acid is prepared most conveniently from prussiate of potash. Wöhler recommends the following method. Ten parts of powdered prussiate are placed in a retort, the neck of which is turned upwards, and a (cooled down) mixture of seven parts of oil of vitriol and fourteen parts of water is then added. If the aqueous acid is wanted, the exit-end of the retort is joined on direct to a Liebig's condenser, which must be kept very cool by a current of cold water. If the anhydrous acid is desired, two wide-necked bottles (or two large U-tubes) charged with fused chloride of calcium and kept at 30° C. by immersion in a water bath of this temperature, must be inserted between the retort and condenser. In this case more particularly it is indispensable to provide for a most efficient condensation of the vapours; the exit-end of the condenser should be provided with an adapter going down to near the bottom of the receiver, which must be surrounded by a freezing mixture. The temperature of the latter, of course, must not be allowed to fall to the freezing-point of the distillate. The retort is heated by means of a sand bath and a brisk distillation maintained until the residue begins to dry up. The result of the reaction is in accordance with the assumption that the dilute vitriol, in the first instance, converts the prussiate, one-half into $(\text{NC})_2\text{Fe.H}_2$, the other into $(\text{NC})_2\text{Fe.K}_2\text{H}_2$, and that through the effect of the heat these two bodies decompose each other into $\{(\text{NC})_2\text{Fe}\} \text{K}_2\text{Fe}$, which remains in the residue as a precipitate, and $(\text{NC})_2\text{H}_6 = 6\text{NCH}$, which distils over. Real NCH is a colourless liquid of 0.6967 specific gravity at 18° C., which freezes at -15° C. (Gay-Lussac) into a white fibrous solid. According to Schulz the acid, if really pure, remains liquid at -37° C. It boils at 26° 5 C.; at 4° 5 its vapour-tension already amounts to half an atmosphere. The vapour is inflammable and burns into carbonic acid, water, and nitrogen. The acid mixes with water in all proportions, with contraction and yet absorption of heat. The solution behaves on distillation like a mere mechanical mixture of its two components. Prussic acid has a very peculiar powerful smell; more characteristic still is a kind of choking action which even the highly attenuated vapour exerts on the larynx. Prussic acid is fearfully poisonous; a few drops of even the ordinary pharmaceutical preparation (of 2 per cent.) are sufficient to kill a large dog. It acts with characteristic promptitude, especially when inhaled as a vapour. Even a relatively large dose, if it has once found its way into the stomach without producing a fatal effect, is said to do relatively little harm there.¹

Prussic acid is characteristically prone to suffer "spontaneous decomposition." Whether the *pure* anhydrous acid really is, in the strictest sense of the word, still requires to be found out; the ordinary preparation, when kept in a close bottle, soon turns brown and turbid from "azulmic" acid, a substance of complex constitution. Other things are formed at the same time. The *pure* aqueous acid is liable to similar changes; in its case formate of ammonia always forms the predominant product. This change is easily understood—

Ammonia. Formic acid.

A strong aqueous prussic acid, when mixed with fuming hydrochloric acid, is soon converted into a magma of crystals of sal-ammoniac, with formation of formic acid, which remains dissolved. And yet, most singularly, the addition to the preparation of a small proportion of hydrochloric or sulphuric acid is the best means for preventing, or at least greatly retarding, its spontaneous change in the very same direction. Aqueous prussic acid acts only very feebly (if at all) on blue litmus; it combines with aqueous caustic alkalis but does not decompose their carbonates; nor does it act upon the generality of insoluble basic metallic oxides or hydrates; mercuric oxide and oxide of silver form noteworthy exceptions to this rule.

Cyanogen, $(\text{NC})_2$.—When dry mercuric cyanide is heated it breaks up, below redness, into mercury and cyanogen gas; part of the latter, however, always suffers polymerization into a solid called "paracyanogen," and presumed to consist of molecules $(\text{NC})_2$. Cyanogen gas is colourless; it has the specific gravity demanded by its formula. It possesses a peculiar odour and has a characteristic

¹ The *British Pharmacopœia* prescribes for the medicinal acid a strength of 2 per cent. of real NCH. The two medicinal preparations known as *aqua amygdalarum amararum* and as *aqua laurocerasi* respectively contain prussic acid in combination with hydride of benzoyl, $\text{C}_6\text{H}_5\text{COH}$. In neither case does the prussic acid pre-exist in the vegetable materials, but is produced during the mashing process which precedes the distillation, by a fermentative decomposition of the amygdalin which they contain. (See FERMENTATION, vol. ix. p. 96.)

irritating effect on the eyes and mucous membranes of the nose. It is poisonous. By strong pressure it is condensable into a liquid which freezes at $-34^{\circ}4$ C., and has the following vapour-tensions P at the temperatures t stated—

$t =$	$-20^{\circ}7$	-10°	0°	$+10^{\circ}$	$+20^{\circ}$ C.
$P =$	1	1.85	2.7	3.8	5 atmos.

At ordinary temperatures water dissolves about 4.5 times, alcohol about 23 times its volume of the gas. The solutions are liable to (very complex) spontaneous decomposition. The list of products includes oxalate of ammonia and urea. Cyanogen burns with a characteristically beautiful peach-blossom coloured flame into carbonic acid and nitrogen. This gas cyanogen, as already stated, is to cyanides what chlorine gas Cl_2 is to chlorides, but it is well to remember that the analogy, though perfect in regard to the corresponding formulæ, does *not*, as a rule, extend to the conditions of formation of the bodies represented. Thus cyanogen does not unite with hydrogen into prussic acid, nor does it combine with ordinary metals in the chlorine fashion. When passed over heated potassium, it is true, it combines with it into cyanide; and caustic potash-ley absorbs it with formation of cyanide and cyanate (NCO.K), just as chlorine yields chloride and hypochlorite KClO ; but this is about the sum-total of the analogies in action. Yet metallic cyanides of all kinds can be produced indirectly.

Cyanide of Potassium, NC.K .—An aqueous mixture of the quantities NCH and KHO no doubt contains this salt, but it smells of the acid, and on evaporation behaves more like a mixture of the two congeners than in any other way. An exhaustive union can be brought about by passing NCH vapour into an alcoholic solution of KHO ; the salt NC.K then comes down as a crystalline precipitate, which must be washed with alcohol and dried, cold, over vitriol. A more convenient method is to dehydrate yellow prussiate and then decompose it by heating it to redness in an iron crucible. The $\text{Fe}(\text{NC})_2$ part of the salt breaks up into cyanogen and nitrogen, which go off, and a carboniferous finely-divided iron, which remains, with cyanide of potassium, which at that temperature is a thin fluid. Yet the iron sometimes refuses to settle with sufficient promptitude to enable one to decant off the bulk even of the fused cyanide. According to private information received by the writer a French manufacturer uses a certain kind of very porous fireclay as an efficient filtering medium.

The ordinary "cyanide of potassium" of trade is not strictly that at all, but at best a mixture of the real salt with cyanate. It is produced by fusing a mixture of eight parts of anhydrous prussiate and three parts of anhydrous carbonate of potash, allowing the reaction

to complete itself and the iron to settle, and decanting off the clear fuse. The product goes by the name of "Liebig's cyanide," but the process was really invented by Rodgers.

Fused cyanide of potassium assumes on cooling the form of a milky white stone-like solid. It fuses readily at a red heat, and at a white heat volatilizes without decomposition, provided that it is under the influence of heat alone; in the presence of air it gradually passes into cyanate; when heated in steam it is converted into carbonate of potash with evolution of ammonia, carbonic oxide, and hydrogen. When heated to redness with any of the more easily reducible metallic oxides it reduces them to the metallic state, while it passes itself into cyanate. It also reduces the corresponding sulphides with formation of sulphocyanate; for example, $\text{Pb}(\text{S or O}) + \text{NCK} = \text{Pb} + \text{NC}(\text{O or S})\text{K}$. Hence its frequent application in blowpipe analysis. When heated with chlorates or nitrates it reduces them with violent explosion. The aqueous solution of the salt has a strongly alkaline reaction; it smells of hydrocyanic acid and is readily decomposed by even such feeble acids as acetic or carbonic. It readily dissolves precipitated chloride, bromide, and iodide of silver; this is the basis of its application in photography. Large quantities of the salt are used in electro-plating.

Other Binary Cyanides.—Of these only a few can be noticed here. (1) **Cyanide of sodium** is very similar to the potassium salt. The same remark, in a more limited sense, holds for the cyanides of barium, strontium, and calcium. (2) **Cyanide of ammonium** (NC.NH_4) forms crystals volatile at 36° C. and smelling of ammonia and hydrocyanic acid. The solution in water decomposes spontaneously, pretty much like that of the free acid. But the anhydrous vapour by itself stands a high temperature, as is proved by the fact that it is produced largely when ammonia is passed over red-hot charcoal, $\text{C} + 2\text{NH}_3 = \text{H}_2 + \text{NCH.NH}_3$. (3) **Mercuric cyanide**, $\text{Hg}(\text{NC})_2$, forms very readily when mercuric oxide is dissolved in aqueous prussic acid. The solution on evaporation and cooling deposits crystals soluble in eight parts of cold water. This salt is not at all decomposed, even when heated, by water, nor appreciably by dilute sulphuric or nitric acid; boiling hydrochloric acid eliminates the NC as hydrocyanic acid; sulphuretted hydrogen acts similarly in the cold. It gives no precipitate with nitrate of silver, nor is it changed visibly by caustic alkalis. It readily

unites not only with other cyanides but also with a multitude of other salts into crystallizable double salts. Mercurous cyanide, $\text{Hg}_2(\text{NC})_2$, seems to have no existence. When it is attempted to produce it by double decompositions, the mixture $\text{Hg} + (\text{NC})_2\text{Hg}$ comes forth instead of the compound $\text{Hg}_2(\text{NC})_2$. (4) Heavy metallic cyanides are mostly insoluble in water, and the general method for their preparation is to decompose a solution of the respective sulphate, chloride, &c., with one of cyanide of potassium. The most important general property of these bodies is that they readily dissolve in solution of cyanide of potassium with formation of double cyanides, which in their capacity as double salts all exhibit, in a higher or lower degree, those anomalies which were fully explained above (see "prussiate of potash"). These "metallo-cyanides," as we will call them, being all, unlike plain cyanide of potassium, very stable in opposition to water and aqueous alkalis, are readily produced from almost any compound of the respective metallic radical—some from the metal itself—by treatment with solution of cyanide of potassium. In all we have said "potassium" may be taken as including sodium and in a limited sense ammonium, but the potassium compounds are best known, and we accordingly in the following section confine ourselves to these.

Metallo-cyanides.—(1) **Silver.**—Cyanide of silver, Ag.NC , is produced as a precipitate by addition of hydrocyanic acid or cyanide of potassium to solution of nitrate of silver. The precipitate is similar in appearance to chloride of silver and, like it, insoluble in cold dilute mineral acids, but soluble in ammonia. At a red heat it is decomposed with formation of a residue of carboniferous metallic silver. Precipitated cyanide of silver, though insoluble in hydrocyanic acid, dissolves readily in cyanide of potassium with formation of argentic cyanide, $\text{AgK} \cdot (\text{NC})_2$, which is easily obtained in crystals, permanent in the air and soluble in eight parts of cold water. Chloride of silver dissolves in cyanide of potassium solution as readily as the cyanide does and with formation of the same double salt— $\text{AgCl} + 2\text{KNC} = \text{KCl} + \text{AgK}(\text{NC})_2$. This salt is used very largely in electro-plating. (2) **Lead.**—From a solution of the acetate cyanide of lead is precipitated by addition of hydrocyanic acid or cyanide of potassium. The precipitate, $\text{Pb}(\text{NC})_2$, has the exceptional property of being insoluble in cyanide of potassium. (3) **Zinc.**—Cyanide of zinc, $\text{Zn}(\text{NC})_2$, is obtained by addition of hydrocyanic acid to a solution of the acetate, as a white precipitate readily soluble in cyanide of potassium with formation of a double salt, $\text{ZnK}_2(\text{NC})_4$, which forms well-defined crystals. (4) **Nickel.**—The cyanide, $\text{Ni}(\text{NC})_2$, is an apple-green precipitate, which is obtained by methods similar to those given under "zinc." It readily dissolves in cyanide of potassium with formation of a crystallizable salt, $\text{NiK}_2(\text{NC})_4 \cdot \text{H}_2\text{O}$, the solution of which is stable in air and not convertible into one of a nickelic (Ni'') compound by chlorine (compare "cobalt" *infra*). The potassio-cyanides of silver, zinc, and nickel as solutions are not changed visibly by caustic alkalis, but their heavy metals can be precipitated by sulphuretted hydrogen or sulphide of ammonium, as from solutions of, for instance, the chlorides. Aqueous mineral acids (in the heat at least) decompose them exhaustively with elimination of all the NC as NCH . (5) **Copper.**—When cyanide of potassium solution is added to one of sulphate of copper, a yellow precipitate of cupric cyanide, $\text{Cu}(\text{NC})_2$, comes down; but on boiling this precipitate loses cyanogen and is converted into a white precipitate of the cuprous salt $\text{Cu}(\text{NC})$. This white precipitate dissolves in cyanide of potassium with formation chiefly of two crystalline double salts, viz., $\text{CuNC} + 6\text{NCK}$, easily soluble in water, and $\text{CuNC} + \text{NCK}$. The latter is decomposed by water with elimination of Cu.NC . The solution of the 6NC.K salt is *not* precipitated by sulphuretted hydrogen. Solutions of potassio-cyanides of cuprous are used in electro-plating. (6) **Gold.**—Metallic gold dissolves in cyanide of potassium solution in the presence of air, thus—

This auro-cyanide of potassium is used largely for electro-gilding, for which purpose it is conveniently prepared as follows. Six parts of gold are dissolved in aqua regia and the solution is precipitated by ammonia. The precipitate (an explosive compound known as "fulminating gold") is dissolved in a solution of six parts of cyanide of potassium, when the double salt is formed with evolution of ammonia. The salt crystallizes in rhombic octahedra, soluble in seven parts of cold water.

In the following potassio-cyanides the heavy metals cannot be detected by means of their ordinary precipitants; these salts all behave like the potassium salts of complex radicals composed of the heavy metal and all the cyanogen. (7) **Cobalt.**—Cyanide of potassium when added to a solution of a cobaltous salt (CoCl_2 , &c.) gives a precipitate soluble in excess of reagent. The solution presumably contains a cobalto-cyanide, $\text{Co}(\text{NC})_2 \cdot x\text{KNC}$, but on exposure to air eagerly absorbs oxygen with formation of cobalti-cyanide, thus—

Chlorine (Cl instead of $\frac{1}{2}\text{O}$) acts more promptly with a similar effect. If the alkaline solution is acidified and boiled, the same cobalti-cyanide is produced with evolution of hydrogen—

Cobalti-cyanide of potassium, $(\text{NC})_6\text{Co}^{III}.\text{K}_3$, forms yellow crystals isomorphous with those of red prussiate (see *infra*). It is a remarkably stable salt. In its behaviour to reagents it exhibits none of the characters of a cobalt salt or of a simple cyanide. Aqueous mineral acids convert it into the hydrogen salt $(\text{NC})_6\text{Co}^{III}.\text{H}_3$, which remains undecomposed on boiling. Heavy metallic salts produce precipitates of cobalti-cyanides; for example, $(\text{NC})_6\text{Co}^{III}.\text{Ag}_3$. (8) *Ferrosium*.—See "prussiate of potash" above. (9) *Ferricum*.—Ferric hydrate and ferric compounds generally do not act upon cyanide of potassium in a manner analogous to that of ferrous compounds; but a ferri-cyanide analogous to the cobalti-salt referred to in (7) is readily produced by passing chlorine into a cold solution of ordinary prussiate, $(\text{NC})_6\text{Fe}^{III}.\text{K}_4 + \text{Cl} = \text{KCl} + (\text{NC})_6\text{Fe}^{III}.\text{K}_3$.¹ In preparing the salt an excess of chlorine and elevation of temperature must be avoided, or else part of the salt is decomposed with formation of a green precipitate. The solution on evaporation and cooling yields splendid dark red crystals, soluble in 2.54 parts of water of 15° C. (Wallace), forming a most intensely yellow solution. (Ordinary prussiate solution is only pale yellow even when saturated in the cold.) This salt (discovered by L. Gmelin in 1822) is now being manufactured industrially and is known in commerce as "red prussiate." In its reactions it is analogous to ordinary yellow prussiate. The same group, $(\text{NC})_6\text{Fe}$, which in the latter acts as a four-valent, in the red salt plays the part of a tri-valent radical, $(\text{NC})_6\text{Fe}$. But the radical thus modified has a great tendency to assume the four-valent form; hence an alkaline solution of red prussiate is a powerful oxidizing agent, $(\text{NC})_6\text{Fe}.\text{K}_3 + \text{KHO} = (\text{NC})_6\text{Fe}.\text{K}_4 + \text{HO}$. The HO goes to the reducing agent. Like the yellow salt, red prussiate is not poisonous, at least when pure.

Ferro- and Ferri-cyanides of Iron.—The two prussiates are constantly being used in the laboratory as very delicate reagents for the detection of iron salt, and for the discrimination of ferrous and ferric compounds in solutions.—(1) ferro-cyanide and ferrous salt, white precipitate; (2) ferri-cyanide and ferric salt, intensely brown coloration; (3) ferro-cyanide and ferric salt, blue precipitate; (4) ferri-cyanide and ferrous salt, blue precipitate. These blue precipitates are being produced industrially and used as pigments, under the names of "prussian blue" and "Turnbull's blue" for (3) and (4) respectively. The latter has been thus known for now half a century; yet the constitution of the precipitates and the true rationale of their formation have been fully cleared up only during the last few years. The main results of the researches referred to are included in the following paragraphs.

(1) *Ferro-cyanide of Hydrogen*, $(\text{NC})_6\text{Fe}.\text{H}_4$, is obtained as a white crystalline precipitate when air-free concentrated solution of yellow precipitate is mixed with hydrochloric acid and ether. It is easily soluble in water and in alcohol. An aqueous solution of it is prepared for technical purposes by mixing a strong solution of yellow prussiate with enough tartaric acid to bring down the potassium as cream of tartar. When the solution of this ferro-hydrocyanic acid is boiled half the cyanogen goes off as NCH, while the other remains as part of a white, rather unstable, precipitate, $(\text{NC})_6\text{Fe}.\text{H}_2$.

When the solution is exposed to the air, especially at higher temperatures, part of the cyanogen goes off as NCH, another part suffers oxidation into $\text{H}_2\text{O} + \text{NC}$, and this latter combines with the $\text{Fe}(\text{NC})_5$ of the original compound into blue bodies similar in their general properties to prussian blue. This latter change is utilized in calico-printing for producing patterns of, or dyeing with, prussian blue. The white precipitate $(\text{NC})_6\text{Fe}.\text{H}_2$ may be looked upon as an acid of which

(2) *Everett's Salt*, $(\text{NC})_6\text{Fe}.\text{K}_2$, is the potash salt. This salt is produced in the ordinary process for making prussic acid (see above). It is probably identical with the white precipitate produced when ferrous salt is decomposed by prussiate of potash. Everett's salt when exposed to the air quickly absorbs oxygen and becomes blue; the reaction, as Williamson showed, assumes a simple form when the precipitate is boiled with nitric acid. One-half of the potassium is then oxidized away, and a blue double ferri-cyanide of potassium and ferrosium takes the place of the original precipitate:—

This blue when boiled with ferro-cyanide of potassium is reconverted into the original Everett's salt with formation of a solution of red prussiate—

the asterisked radicals changing places.

(3) *Soluble Prussian Blue* is isomeric with Williamson's blue. It is produced by mixing a solution of ferric salt with excess of yellow prussiate, which, however, is an old process; what has been ascer-

tained lately is that the very same precipitate is produced by addition to a ferrous salt of an excess of red prussiate.

B' and B'' in the formulae look different, but the difference is only apparent; in either case the group $(\text{NC})_6$ is combined with 1Fe and 1Fe and 1K; the bodies are identical (Skraup; Reindel). The precipitate B, though insoluble in salt solutions, is soluble in pure water, forming an intensely blue solution; hence the name.

Now the potassium in soluble prussian blue can be displaced by iron in two ways, namely, by digestion with solutions of ferrous or ferric salts. In the former case $(\text{NC})_6\text{FeFeK}$ becomes $(\text{NC})_6\text{FeFe}_2$, or empirically $(\text{NC})_{12}\text{Fe}_3$; this is Gmelin's ("Turnbull's") blue. In the latter case $(\text{NC})_6\text{FeFeK}$ becomes $(\text{NC})_6\text{FeFe}_2$, or empirically $(\text{NC})_{18}\text{Fe}_7$; this is prussian blue as discovered by Diesbach. Contrasting this latter formula with that of Gmelin's blue $(\text{NC})_{12}\text{Fe}_3$, we see that the latter needs only lose $\frac{1}{2}\text{Fe}$ to become prussian blue; this surplus iron in fact can be withdrawn by means of nitric acid.

In the manufacture of prussian blue the general process is to first precipitate ferrous sulphate with yellow prussiate and then to fully oxidize the precipitate by means of nitric acid or chlorine as far as the oxygen of the air does not do it. The following receipt is recommended amongst others. Six parts each of green vitriol and yellow prussiate are dissolved separately, each in fifteen parts of water, and the solutions mixed. One part of concentrated sulphuric acid and twenty-four parts of fuming muriatic acid are then added, and after standing some hours also a solution of bleaching powder in instalments until the blue colour is fully developed. "Turnbull's" blue is made by precipitating red prussiate of potash with excess of ferrous salt; but it is easily seen from what was said above that the use of this relatively expensive double cyanide might be dispensed with. The properties of the two pigments are pretty much the same. They are sold in the form of solid cakes or lumps, which, in addition to their blue colour, present a coppery lustre on fracture. They are stable against acids, but sensibly affected (bleached) on prolonged exposure to sunlight; and, although they stand neutral soap fairly well, they are decomposed promptly by solutions of even the carbonates of the alkalis with formation of hydrated oxides of iron. The cheaper commercial varieties are more or less largely diluted with clay, sulphate of baryta, &c. Pure prussian blue dissolves readily in a dilute solution of oxalic acid; the intensely blue solution used to serve as a blue ink, but has come to be superseded by the several more brilliant blues of the coal-tar series. These tar-blues have displaced prussian blue also in other applications, and as a commercial pigment it has besides to struggle against ultramarine. In short, it has gone very much out of use, and as a consequence the manufacture of yellow prussiate is no longer so remunerative as it used to be.

Analysis of Cyanides.—As hydrocyanic acid and cyanide of potassium are dangerously poisonous, and the latter at least is easily procured in commerce, the detection of cyanogen in this state of combination is one of the problems of forensic chemistry. To detect such cyanogen in, say, the contents of a stomach the first step is to distil the mass after acidification with tartaric acid, which decomposes cyanide of potassium but does not liberate prussic acid from prussian blue (or even prussiate of potash?). If the distillate gives no precipitate with nitrate of silver hydrocyanic acid is absent, if it does the precipitate may have been produced by hydrochloric acid, which may then be eliminated by redistillation with borax or sulphate of soda, neither of which affects NCH. But even in the presence of chlorides the following two tests give perfect certainty. (1) A solution of hydrocyanic acid, when alkalinized with caustic potash and then mixed with, first ferrous-ferric salt and then excess of hydrochloric acid, gives a precipitate, or at least a green suspension, of prussian blue. (2) A solution of NCH, when mixed with ammonia and yellow sulphide of ammonium, is changed into one of sulphocyanate of ammonium, which, after removal of the excess of reagents by evaporation at a gentle heat, strikes an intense and very characteristic red colour with ferric salts, which colour does not vanish (as that of ferric acetate does) on even strong acidification with mineral acid (Liebig's test). The quantitative determination of cyanogen given as an aqueous solution of hydrocyanic acid or cyanide of potassium can (if haloids are absent) be effected by adding excess of nitrate of silver, then acidifying, if necessary, with nitric acid, filtering off, washing, drying, and weighing the cyanide of silver produced. $\text{AgNC} = 134$ corresponds to $\text{NCH} = 27$ parts. A more expeditious method has been invented by Liebig. A known quantity of the given prussic acid is alkalinized strongly with caustic potash and then diluted freely with water. The caustic alkali usually contains plenty of chloride as an impurity, else a little alkaline chloride must be added. A standard solution of nitrate of silver (conveniently adjusted so as to contain 6.30 grammes of fused nitrate per 1000 cubic centimetres, equivalent to 2 grammes of NCH) is now dropped in from a burette until the cloud of chloride of silver which appears locally from the first just fails to disappear on stirring, i.e., until the reaction $2\text{KNC} + \text{AgNO}_3 = \text{KAg}.\text{NC}_2 + \text{KNO}_3$

¹ Here we use the symbol "fe" as designating 56 parts of ferric iron,—"Fe" meaning the same quantity of ferrosium.

has just been completed. One cub. cent. of silver solution used indicates 2 milligrammes of NCH . Liebig's method lends itself particularly well for the assaying of the medicinal acid and of cyanide of potassium. The two tests for hydrocyanic acid given above apply as they stand to solutions of the cyanides of alkali and alkaline-earth metals, but *not* to mercuric cyanide. In regard to all other cyanides we have only space to say that from a certain set (which includes the cobalti-cyanides and the platinum cyanides) cyanogen cannot be extracted at all as NCH (or AgNO) by any known methods. Such bodies must be identified by their own specific reactions or by elementary analysis. All cyanides are decomposed by *hot* concentrated sulphuric acid; the carbon goes off as CO , the nitrogen remains as sulphate of ammonia and the metals as sulphates, which brings them within the range of the routine methods of analysis.

Cyanates.—These were discovered by Wöhler. The potassium salt NCO.K is produced by the oxidation of fused cyanide, for preparative purposes most conveniently by Wöhler's method. An intimate mixture of two parts of absolutely anhydrous prussiate of potash and one part of equally dry binoxide of manganese is heated on an iron tray until the mass has become brownish black and just begun to fuse. It is now allowed to cool and exhausted by boiling 80 per cent. alcohol. The filtrate on cooling deposits crystals of the salt NCO.K . If only an aqueous solution of this salt is wanted for immediate use, the fuse may be extracted by *cold* water. From this solution the cyanate of silver, NCO.Ag , or lead, $(\text{NCO})_2\text{Pb}$, can be prepared by precipitation with solutions of the respective nitrates or acetates. *Hot* water decomposes cyanate of potash promptly with formation of carbonates of potash and ammonia, $\text{KNCO} + 2\text{H}_2\text{O} = \text{NH}_3 + \text{KHO} + \text{CO}_2$. On addition of mineral acid to even the cold solution only a very little of the cyanic acid is liberated as such; the bulk breaks up at once with effervescence, thus, $\text{NCO.H} + 2\text{H}_2\text{O} = \text{NH}_3 + \text{CO}_2 + \text{H}_2\text{O}$. Very interesting is the action of the solution of cyanate of potash on sulphate of ammonia; its direct effect is the formation of cyanate of ammonia, NCO.NH_4 , but this salt almost immediately passes spontaneously into its isomer urea, which is not a cyanate at all but the amide of carbonic acid, *i.e.*, $\text{CO}(\text{OH})_2 - 2(\text{OH}) + 2\text{NH}_3 = \text{CO} \begin{smallmatrix} \text{NH}_2 \\ \text{NH}_2 \end{smallmatrix}$. This reaction was discovered by Wöhler, who thus for the first time produced an organic substance from inorganic materials, or virtually from its elements. Singularly, it is this pseudo-cyanate urea which serves as a material for making cyanic acid. When hydrochlorate of urea, $\text{HCl.CON}_2\text{H}_4$, is heated to 145°C . the latter behaves as if it were cyanate of ammonia: the ammonia unites with the hydrochloric acid into sal-ammoniac and the cyanic acid is set free, but immediately suffers polymerization into cyanuric acid, a solid tri-basic acid of the composition $\text{N}_3\text{C}_3\text{O}_3\text{H}_3$, which, being difficultly soluble, can be freed from the sal-ammoniac by being washed with cold water. If perfectly anhydrous cyanuric acid be subjected to dry distillation it furnishes a distillate of (liquid) cyanic acid NCO.H , which must be condensed in a vessel surrounded by a freezing mixture.

Cyanic acid has a very appreciable vapour-tension even at ordinary temperatures, and the least trace of its vapour makes itself felt by a characteristically violent and dangerous action on the respiratory organs. With dry ammonia gas it unites into true cyanate of ammonia. We do not know much of its own properties, because as soon as it comes out of the freezing mixture it begins to suffer polymerization into "cyamelid" with great evolution of heat. This cyamelid is a porcelain-like mass, insoluble in all ordinary solvents and devoid of acid properties. Dry distillation reconverts it into cyanic acid.

Thiocyanates.—This term means bodies like cyanates, but containing sulphur instead of the oxygen of the latter. Thiocyanates are better known, however, as sulphocyanates or sulphocyanides. (1) The potassium salt NCS.K is formed when cyanide of potassium is fused with sulphur or certain metallic sulphides, *e.g.*, PbS . The usual method of preparation is to fuse together forty-six parts of dehydrated yellow prussiate of potash, seventeen of dry carbonate of potash, and thirty-two of sulphur. The fuse is exhausted with boiling alcohol and the filtered solution allowed to cool, when crystals of the salt separate out. The salt is very soluble in water with characteristically large absorption of heat. (2) The ammonium salt NCS.NH_4 can be prepared by allowing a mixture of alcohol, strong aqueous ammonia, and bisulphide of carbon to stand for a time and then warming it. Thiocarbonate of ammonium, $\text{CS}_2.(\text{NH}_4)_2\text{S}$, is produced first, but subsequently it gives up $2\text{H}_2\text{S}$ to the ammonia and becomes NCS.NH_4 , which is easily obtained in crystals. The tar water obtained in the manufacture of coal-gas sometimes contains sufficient quantities of this salt to make it worth while to recover it. Both the potassium and the ammonium salt are much used as reagents, and more especially as precipitants for copper and silver. Solutions of cupric salt when mixed with sulphocyanate assume the dark-brown colour of the cupric salt $\text{Cu}(\text{NCS})_2$, but on addition of sulphurous acid the colour disappears and a white precipitate of cuprous sulphocyanide,

NCS.Cu , comes down, which, if enough of reagent was used, contains all the copper. If sulphocyanate is added to nitrate of silver, all the silver is precipitated as Ag.NCS , similar in appearance to the chloride and, like it, insoluble in water and in nitric acid. Upon this and the fact that sulphocyanates strike a deep red colour with ferric salts Volhard has based an excellent titrimetric method for the determination of silver. (See **SILVER**.)

Syntheses of Cyanogen Compounds.—Synthetical organic chemistry dates from Wöhler's discovery of the artificial formation of urea, and in the further development of this branch of the science cyanogen has played a prominent part. (For illustrations we may refer to certain passages in the present article and in those on **METHYL** and on **NITROGEN**.) Hence it is worth while to enumerate briefly the synthetical method for the making of cyanogen itself. (1) Hydrocyanic acid is produced when a current of electric sparks is made to cross a mixture of acetylene, C_2H_2 , and nitrogen. (2) Cyanide of ammonium is formed when ammonia is passed over red-hot charcoal (see *supra*). (3) Metallic cyanides are produced when dry nitrogen gas is passed over a dry mixture of carbonate of potash or baryta and charcoal at a white heat. A similar reaction goes on spontaneously in the iron-smelting furnaces and gives rise to the formation of vapour of cyanide of potassium. (4) Sulphocyanide of ammonium is produced from bisulphide of carbon and ammonia, as explained above. (W. D.)

PRYNNE, WILLIAM (1600-1669), was born at Swainswick near Bath in 1600. He was educated at Bath grammar-school, and became a commoner of Oriel College, Oxford, in 1616, taking his B.A. in 1621; he was admitted a student of Lincoln's Inn in the same year, and in due time became a barrister. His studies led him deeply into legal and constitutional lore, and no less deeply into ecclesiastical antiquities. He was Puritan to the core, with a tenacious memory, a strength of will bordering upon obstinacy, and a want of sympathy with human nature in its manifold variety. His first book, *The Perpetuity of a Regenerate Man's Estate*, 1627, was devoted to a defence of one of the main Calvinistic positions, and *The Unloveliness of Love-locks and Health's Sickness*, 1628, were devoted to attacks upon prevailing fashions, conducted without any sense of proportion, and treating follies on the same footing as scandalous vices.

After the dissolution of parliament in 1629 Prynne came forward as the assailant of Arminianism in doctrine and of ceremonialism in practice, and thus drew down upon himself the anger of Laud. *Histrio-mastix*, published in 1633, was a violent attack, not upon the special immoralities of the stage of Prynne's day but upon stage-plays in general, in which the author laid himself open to the charge of assailing persons in high position, in the first place by pointing out that kings and emperors who had favoured the drama had been carried off by violent deaths, which assertion might easily be interpreted as a warning to the king, and in the second place by applying a disgraceful epithet to actresses, which, as Henrietta Maria was taking part in the rehearsal of a ballet just as the sheet containing the offensive words was passing through the press, was supposed to apply to the queen. On 17th February 1634 Prynne was sentenced by the Star Chamber to be imprisoned and also to be fined £5000, expelled from Lincoln's Inn, rendered incapable of returning to his profession, degraded from his degree in the university of Oxford, and set in the pillory, where he was to lose both his ears. On 7th May Prynne was placed in the pillory and lost his ears. The rest of the sentence, with the exception of the clause relating to the payment of the fine, was carried out. A sharp letter written by him to Laud criticizing his arguments at the trial was made the foundation of a fresh charge. Prynne, however, got the letter into his hands and tore it up. Though he was again brought before the Star Chamber, on 11th June, no additional penalty was inflicted on him. There is no reason to suppose that his punishment was unpopular. In 1637 he was once more in the Star Chamber, together with Bastwick and Burton. In *A Divine Tragedy lately acted*

he had attacked the Declaration of Sports, and in *News from Ipswich* he had attacked Wren and the bishops generally. On 30th June a fresh sentence, that had been delivered on the 14th, was executed. The stumps of Prynne's ears were shorn off in the pillory. When on 27th July he was sent to what was intended to be perpetual imprisonment at Lancaster his journey was a triumphal progress,—the imposition of ship-money and the metro-political visitation having rendered the minds of Englishmen far more hostile to the Government than they had been in 1634. Before long Prynne was removed to Mont Orgeuil Castle in Jersey, where it was hoped that he could be so entirely isolated that no word of his would reach the outer world again.

Immediately upon the meeting of the Long Parliament in 1640 Prynne was liberated. On 28th November he entered London in triumph, and on 2d March 1641 reparation was voted by the Commons, to be made to him at the expense of his persecutors. As might have been expected, Prynne after his release took the side of the Parliament strongly against the king, especially attacking in his writings his old enemies the bishops, and accusing Charles of showing undue favour to the Roman Catholics. He commented on the words of Psalm cv., "Touch not mine anointed," by arguing that they inhibited kings from injuring God's servants who happened to be their subjects, and in a lengthy work entitled *The Sovereign Power of Parliaments and Kingdoms* he maintained that the taking arms by parliament in a necessarily defensive war was no treason either in law or in conscience.

Prynne's sufferings had not served to render him compassionate to others. In 1643 he took an active part in the proceedings against Nathaniel Fiennes for the surrender of Bristol. During this and the following year, however, his chief energies as a prosecutor were directed against Archbishop Laud. The cessation of hostilities with the Irish insurgents agreed to on 15th September 1643 brought Charles's relations with the Catholics into increased disrepute, and Prynne attacked Laud as the soul of a great Popish plot by publishing both before and after his execution various collections of documents, one of which at least was garbled to render it more telling. Even before the execution of Laud Prynne found a new enemy in the Independents. In 1644 he published *Twelve Considerable Serious Questions touching Church Government*, in which he upheld the right of the state to form a national church in accordance with the word of God, and reviled the Independents, partly as advocating an unscriptural discipline, partly as introducing heresy and division, and maintaining that all religions ought to be tolerated. To the principle of individual liberty Prynne was from the beginning to the end irreconcilably hostile. For some time to come he poured forth pamphlet after pamphlet in vindication of his assertions. Flowing out of this controversy came another, beginning in 1645 with *Four Short Questions*, privately circulated, and followed by *A Vindication of Four Serious Questions of Great Importance*, in which he denied the right of the clergy to excommunicate or to suspend from the reception of the sacrament otherwise than by law. Prynne, in short, maintained the supremacy of the state over the church, whilst he argued that the state ought to protect the church from the rivalry of sectarian associations.

Early in 1648 Prynne broke new ground. *The Levellers Levelled* was directed against the dangerous opinion that the Lords should be brought down into the House of Commons, there to sit and vote. As usual, he argued his case on purely antiquarian and technical grounds, without any intellectual grasp of his subject.

On 7th November 1648 Prynne at last obtained a seat

in the House of Commons. He at once took part against those who called for the king's execution, and on 5th December delivered a speech of enormous length in favour of conciliating the king, who had inflicted the most grievous injuries upon him and whose misgovernment he had bitterly denounced. The result was his inclusion in Pride's "purge" on the morning of the 6th, when, having attempted resistance to military violence, he was subjected to imprisonment. A fresh protest, published on 1st January 1649 under the title of *A Brief Memento to the Present Unparliamentary Junto*, coupled with his contemptuous refusal to avow his authorship, brought about a fresh order of imprisonment on 10th January from the House of Commons itself, which, however, does not seem to have been carried out. After recovering his liberty Prynne retired to Swainswick. On 7th June 1649 he was assessed to the monthly contribution laid on the country by Parliament. He not only refused to pay but published *A Legal Vindication of the Liberties of England* on the ground that no tax could be raised without the consent of the two Houses. In the same year he commenced a long historical account of ancient parliaments, which was evidently intended to reflect on the one in existence. In 1650 his labours were cut short by a warrant from President Bradshaw, dated 1st July, and ordering his arrest. For the remainder of the year he was imprisoned in Dunster Castle, whence he was removed in January 1651 to Taunton, and in July to Pendennis Castle. On 1st February 1652 the council of state ordered his discharge on giving a bond of £1000 to do nothing to the prejudice of the Commonwealth. On his resolute refusal to accept the condition an absolute order for his release was given on 18th February. From his release till the death of Cromwell Prynne refrained from making any further assault on the existing Government. His strong conservatism, however, found expression in an argument in defence of adwosons and patronages and an attack on the Quakers, both published in the same year, as well as in an argument against the admission of the Jews to England issued in the beginning of 1655.

It was not until the restoration of the Rump Parliament by the army on 7th May 1659 that Prynne again came into prominent notice, though he had in the previous year issued *A Plea for the Lords and House of Peers* and *A New Discovery*, viz., that Quakers were Jesuits in disguise. On that day, in addition to the Rump, fourteen of the secluded members, with Prynne among them, claimed admittance. The claim was of course refused, but on a second attempt on the 9th, through the inadvertence of the doorkeepers, Prynne, Annesly, and Hungerford succeeded in taking their seats. When they were observed, however, no business was done, and the House purposely adjourned for dinner. At the return of members in the afternoon the doors were found guarded; the secluded members were not permitted to pass, and a vote was at once taken that they should not again be allowed to enter the House. Wrathful at the failure of his protest and at the continuance of the republican form of government, Prynne attacked his adversaries fiercely in print. In *England's Confusion*, published 30th May 1659, in the *True and Full Narrative*, and in *The Brief Necessary Vindication* he gave long accounts of the attempt to enter the House and of his ejection, while in the *Curtaine Drawne* he held up the claims of the Rump to derision. In *Mola Asinaria* the ruling powers are described as "a new-fangled Government, compacted of Treason, Usurpation, Tyranny, Theft, and Murder." Wood, however, denies that this was by Prynne. In *Shuffling, Cutting, and Dealing*, 26th May, he rejoiced at the quarrels which he sees arising, for "if you all complain I hope I shall win at last." *Concordia Discors* pointed out

the absurdity of the constant tendency to multiply oaths, while "remonstrances," "narratives," "queries," "prescriptions," "vindications," "declarations," and "statements" were scattered broadcast. Upon the cry of the "good old cause" he is especially sarcastic and severe in *The True Good Old Cause rightly stated* and other pamphlets. *Loyalty Banished* explains itself. His activity and fearlessness in attacking those in power during this eventful year were remarkable, and an ironical petition was circulated in Westminster Hall and the London streets complaining of his indefatigable scribbling. On 12th October the Rump was again expelled by Lambert, and on 24th December once more restored. On 26th December Prynne made another fruitless attempt to take his seat. In obedience to the popular voice, however, the ejected members of 1648, with Prynne among them, wearing a basket-hilt sword, re-entered the House and resumed their old seats on 21st February 1660. He boldly declared that if Charles was to come back it were best done by the votes of those who had made war on his father, and was admonished for his language by Monk and the privy council. This parliament recalled Charles and dissolved itself immediately,—Prynne bringing in the Bill for the dissolution on 24th February. On 13th March he appears as one of three appointed to carry out the resolution of the House expunging the Engagement.

The Convention Parliament, which met on 25th April 1660, contained a large number of Presbyterians. Prynne, who was returned for two places, Ludgershall and Bath, elected to sit for the latter, and on 16th June presented to the king an address from the corporation, evidently drawn up by himself, under the title of *Bathonia Rediviva*. On 1st May he was nominated on the committee appointed "to peruse the Journals and Records, and to examine what pretended Acts or orders have passed, inconsistent with the government by King, Lords, and Commons, and report them, with their opinion thereon, to this House," and to secure the steady administration of the law, and the confirmation of the legal judgments of the past years. On 9th May he went to the Lords with various loyal votes of the Commons, and again on 18th May and on 9th June. On 3d June he "fell upon" Ashley Cooper for putting his hand to the "instrument" to settle the Protector in power. On the 13th he moved that Colonel Fleetwood, Richard Cromwell, John Goodwin, Thorpe, and Whitelock should be excepted from the Act of general pardon and oblivion, the speedy passing of which he strongly urged upon the House. It is said that at the Restoration he applied to be made one of the barons of the exchequer, and that it was in default of this, and to keep so active a man in good temper, that he was appointed chief keeper of the records in the Tower with a salary of £500 a year by Charles, "of his owne meere motion for my services and sufferings for him under the late usurpers, and strenuous endeavours by printing and otherwise to restore His Majesty." On 2d July he supported a proposal that all officers who had served during the Protectorate should now refund their salaries, and declared that he knew that those persons had received above £250,000 for their iniquitous doings and to keep out the king, a charge he had previously made on 12th May. In all the debates he was for severity upon any one who had held office under Cromwell. On 9th July he spoke "very honestly and passionately" from the Presbyterian point of view in the first great debate on religion, and on the 16th declared he "would not be for bishops unless they would derive their power from the king and not vaunt themselves to be *jure divino*." In the debate of the 27th upon the Lords' delay in passing the Act of Indemnity Prynne found an opportunity for expressing his hatred of priests and Jesuits; and on the 30th, in the

debate on the Ministers' Bill, he urged a settlement on the principle that the ministers should be compelled to take the oath, but that "all presentations should be good throughout, though not by the right patrons, in time of trouble." On 17th August he spoke passionately against any leniency whatsoever being extended to any of the king's judges. It is curious, however, to find that the House appointed him to carry the petition to the king in favour of Lambert or Vane. When the question of disbanding came up, for the carrying out of which he was in October made one of the commissioners, Prynne moved that no arrears should be paid to those who had acted with Lambert and did not submit. On 7th November he supported the Bill for the attainder of Cromwell and others who had participated in the king's execution, and were since dead, and particularly desired that the House would take the first and second reading at the same sitting, as was done in the case of the king's trial. At some time in this year (1660) he wrote a letter on the evil custom of drinking healths, a subject discussed in the House on 10th November. There was indeed scarcely any debate in which Prynne's voice was not heard; he spoke against laying the cost of the abolition of the court of wards upon the excise, having been in August appointed on the commission for appeals and regulating the excise, and in favour of Bills against the profanation of the Lord's Day (in which his knowledge of ecclesiastical controversy again appeared) and against swearing. He appears at this time to have been officially connected with the Admiralty. He supported on 27th November the abortive attempt to turn the king's declaration concerning ecclesiastical affairs into a Bill, and moved against the payment of the debts of the attainted regicides. In December he wrote against the bishops to the king, thus "blemishing his late services." During this year was published *A Seasonable Vindication of the Supream Authority and Jurisdiction of Christian Kings, Lords, Parliaments, as well over the Possessions as Persons of Delinquents, Prelates, and Churchmen*.

At the elections for the Pensionary Parliament, which met on 8th May 1661, Prynne was again returned as member for Bath in spite of the vehement efforts of the Royalists headed by Sir T. Bridge. This parliament was bent upon the humiliation of the Presbyterians, and Prynne appears in his familiar character of protester. On 30th May, when the members took the sacrament together at St Margaret's, "Mr Prynne and some few others refused to take it kneeling. The parson with the bread passed on and refused to give it, but he with the wine, not noticing, gave the wine." With Secretary Morris Prynne opposed the motion that Dr Gunning should receive the thanks of the House and be desired to print his sermon. On the 18th of this month he had moved that the Engagement, with the Solemn League and Covenant, should be burned by the hangman. On 13th July he was the subject of attack, as being in a way the representative of Presbyterianism; the House in its vehement Anglicanism declared that his paper lately published, *Sundry Reasons against the new intended Bill for governing and reforming Corporations*, was illegal, false, scandalous, and seditious. Prynne was censured, and so strong was the feeling that he deemed it best to express his sorrow, upon which the offence was remitted. The continued attacks upon the Presbyterians led him to publish his *Short, Sober, Pacific Examination of Exuberances in the Common Prayer*, as well as the *Apology for Tender Consciences touching Not Bowing at the Name of Jesus*. In 1662 there appeared also the *Brevia Parliamentaria Rediviva*, possibly a portion of the *Register of Parliamentary Writs*, of which the fourth and concluding volume was published in 1664. During 1663 he served constantly

on committees, and was chairman of the committee of supply in July, and again in April 1664.

In the third session Pryne was once more, 13th May 1664, censured for altering the draft of a Bill relating to public-houses after commitment, but the House again, upon his submission, while taking severe notice of an irregularity committed by "so ancient and knowing a member," remitted the offence, and he again appears on the committee of privileges in November and afterwards. In 1665 and 1666 he published the second and first volumes respectively of the *Exact Chronological Vindication and Historical Demonstration* of the supreme ecclesiastical jurisdiction exercised by the English kings from the original planting of Christianity to the death of Richard I. In the latter year especially he was very busy with his pen against the Jesuits. In January 1667 he was one of three appointed to manage the evidence at the hearing of the impeachment of Lord Mordaunt, and in November of the same year spoke in defence of Clarendon, so far as the sale of Dunkirk was concerned; and this appears to have been the last time that he addressed the House. In 1668 was published his *Aurum Reginæ* or *Records concerning Queen-gold*, the *Brief Animadversions on Coke's Institutes* in 1669, and the *History of King John, Henry III., and Edward I.*, in which the power of the crown over ecclesiastics was maintained, in 1670. The date of the *Abridgment of the Records of the Tower of London* is doubtful, though the preface is dated 1656/57. Pryne died in his lodgings at Lincoln's Inn, 24th October 1669, and was buried in the walk under the chapel there, which stands upon pillars. His will, by which he gave one portion of his books to Lincoln's Inn and another to Oriel College, is dated 11th August 1669. Pryne was never married.

The following curious account of his habits is given by Wood. "His custom when he studied was to put on a long quilted cap which came an inch over his eyes, serving as an umbrella to defend them from too much light; and, seldom eating a dinner, would every three hours or more be munching a roll of bread, and now and then refresh his exhausted spirits with ale brought to him by his servant." There is a portrait of him in Oriel College, Oxford, and Wood mentions one by Hollar, and an engraving by Stent, as the best extant. (S. R. G.—O. A.)

PRYTANIS (pl. *prytaneis*) was the title of certain officials in Greek states. They appear to have succeeded the kings at the time when the monarchical form of government was abolished throughout Greece. At Rhodes they continued to be the chief magistrates as late as the 1st century B.C., but in other states their functions dwindled. Though they were not priests, they had the charge of certain public sacrifices. Their headquarters were in the "prytaneum" or town-hall, the central point of a Greek state, where a fire was kept perpetually burning on the public hearth. When a colony was founded the fire in the prytaneum of the new city was kindled from the fire in the prytaneum of the mother-city, and if this colonial fire ever happened to be extinguished it was rekindled from the same source. At Athens in classical times the prytaneis were those fifty members of the council of five hundred who presided at the council meetings as well as at the popular assemblies. They consisted of the fifty members who represented one of the ten tribes on the council. The office was held for a tenth of a year and passed in rotation to the representatives of each of the ten tribes. During their term of office the prytaneis were maintained at the public expense in the tholos or rotunda (not, as is sometimes stated, in the prytaneum). As the highest mark of honour, distinguished citizens and their descendants were sometimes maintained for life in the prytaneum. Here, too, ambassadors were entertained. There was further a court of justice at Athens called the "court in the prytaneum"; it tried murderers who were not to be found, and also lifeless instruments

which had been the cause of death,—an institution probably existing from a very remote antiquity.

PRZEMYSL, one of the principal towns of Galicia, Austria, and the seat of a Roman Catholic and of a Greek bishop, is picturesquely situated on the river San, about 140 miles to the east of Cracow. It contains several churches, of which the two cathedrals are the most interesting, and numerous convents, schools, and seminaries. Among its manufactures are wooden wares, linen, leather, and liqueur, and a brisk trade is carried on in these articles and in agricultural produce. The trade is mostly in the hands of Jews, who form fully a third of the population. On the hill above the town are the ruins of an old castle, said to have been founded by Casimir the Great. Since 1874 Przemyśl has been strongly fortified. The population of the town proper in 1880 was 9244, of the commune 20,040.

Przemysl, one of the oldest towns in Galicia, claims to have been founded in the 8th century, and was at one time capital of a large independent principality. Casimir the Great and other Polish princes endowed it with privileges similar to those of Cracow, and it attained a high degree of prosperity. In the 17th century its importance was destroyed by inroads of Tatars, Cossacks, and Swedes.

PSALMANAZAR, GEORGE (c. 1679-1763), the assumed name of a pretended native of Formosa, who was in reality a Frenchman, and was born about 1679, probably in Languedoc. According to his own account he was sent in his seventh year to a free school taught by two Franciscan monks, after which he was educated in a Jesuit college "in an archiepiscopal city." On leaving college he was recommended as tutor to a young gentleman, but soon fell into a lazy and idle life and became involved in pecuniary difficulties. This induced him to assume various personations in order to obtain a supply of ready money, his first being that of a pilgrim on the journey to Rome. Afterwards he travelled through Germany, Brabant, and Flanders in the character of a Japanese convert. At Liège he enlisted in the Dutch service, shortly after which he altered his character to that of an unconverted Japanese. At Sluys he made the acquaintance of a Scotch chaplain, by whom he was brought over to England and introduced to the bishop of London. Having undergone conversion to Christianity, he was employed by the bishop to translate the church catechism into what was supposed to be the Formosan language. In 1704 he published a fictitious *Historical and Geographical Description of Formosa*, and was shortly afterwards sent to complete his studies at the university of Oxford. The work of course was founded on previous publications, but the compilation was done with great cleverness, in addition to which he printed a so-called Formosan alphabet, and specimens of the language accompanied with translations. In 1707 he published *Dialogue between a Japanese and a Formosan*. There also appeared without date *An Inquiry into the Objections against George Psalmanazar of Formosa, with George Psalmanazar's Answer*. To add to his income he also joined another person in promoting the sale of a sort of white japan, the art of painting which he professed to have brought from Formosa. His pretensions were from the beginning doubted by many, and when exposure was inevitable he made a full confession of his guilt. Throughout the rest of his life he not only exhibited a seemingly conscientious regard for truth but according to Dr Samuel Johnson, as reported by Mrs Piozzi, "a piety, penitence, and virtue exceeding almost what we read as wonderful in the lives of the saints." Dr Johnson used to discuss theological and literary matters with him in an alehouse in the city, and cherished so high an opinion of his character and talents that he asserted he would "as soon think of contradicting a bishop." Psalmanazar obtained a comfortable living by writing for the booksellers. He published

Essays on Scriptural Subjects (1753), contributed various articles to the *Ancient Universal History*, and completed Palmer's *History of Printing*. He died in Ironmonger Row, Old Street, London, 3d May 1763. His memoirs appeared in 1764 under the title *Memoirs of * * ** commonly known by the Name of George Psalmanazar, but do not disclose his real name or the place of his birth.

PSALMS, Book of, or PSALTER, the first book of the Hagiographa in the Hebrew Bible.

Title and Traditional Authorship.—The Hebrew title of the book is תְּהִלִּים, *tēhillim*, or סִפְרֵי תְּהִלִּים, “the book of hymns” or rather “songs of praise.”¹ The singular תְּהִלָּה is properly the infinitive or *nomen verbi* of תָּהַל, a verb employed in the technical language of the temple service for the execution of a jubilant song of praise to the accompaniment of music and the blare of the priestly trumpets (1 Chron. xvi. 4 sq., xxv. 3; 2 Chron. v. 12 sq.). The name is not therefore equally applicable to all psalms, and in the later Jewish ritual the synonym *hallel* specially designates two series of psalms, cxiii.-cxviii. and cxlvi.-cl., of which the former was sung at the three great feasts, the *encænias*, and the new moon, and the latter at the daily morning prayer. That the whole book is named “praises” is clearly due to the fact that it was the manual of the temple service of song, in which praise was the leading feature. But for an individual psalm the usual name is מִזְמוֹר (in the Bible only in titles of psalms), which is applicable to any piece designed to be sung to a musical accompaniment. Of this word *psalmos*, “psalm,” is a translation, and in the Greek Bible the whole book is called *psalmoi* or *psalterion*.² The title *psalmoi* or *βιβλὸς ψαλμῶν* is used in the New Testament (Luke xx. 42, xxiv. 44; Acts i. 20), but in Heb. iv. 7 we find another title, namely “David.” Hippolytus tells us that in his time most Christians said “the Psalms of David,” and believed the whole book to be his; but this title and belief are both of Jewish origin, for in 2 Mac. ii. 13 τὰ τοῦ Δαυὶδ means the Psalter, and the title of the apocryphal “Psalter of Solomon” implies that the previously existing Psalter was ascribed to David. Jewish tradition does not make David the author of all the psalms; but as he was regarded as the founder and legislator of the temple psalmody (1 Chron., *ut sup.*; Ezra iii. 10; Neh. xii. 36, 45 sq.; Eccus. xlvii. 8 sq.), so also he was held to have completed and arranged the whole book, though according to Talmudic tradition³ he incorporated psalms by ten other authors, Adam, Melchizedek, Abraham, Moses, Heman, Jeduthun, Asaph, and the three sons of Korah. With this it agrees that the titles of the psalms name no one later than Solomon, and even he is not recognized as a psalmist by the most ancient tradition, that of the LXX., which omits him from the title of Ps. cxxvii. and makes Ps. lxxii. be written not by but of him. The details of the tradition of authorship show considerable variation; according to the Talmudic view Adam is author of the Sabbath psalm, xcii., and Melchizedek of Ps. cx., while Abraham is identified with Ethan the Ezrahite (Ps. lxxxix.). But, according to older Jewish tradition attested by Origen,⁴ Ps. xcii. is by Moses, to whom are assigned Pss. xc.-c. inclusive, according to a general rule that all anonymous pieces are by the same hand with the nearest preceding psalm whose author is named; and Ps. cx., which by its title is Davidic, seems to have been given to Melchizedek to avoid the dilemma of Matt. xxii. 41 sq.

Origen's rule accounts for all the psalms except i. and ii., which were sometimes reckoned as one poem (Acts xiii. 33 in the Western text; Origen; *B. Berakhoth*, f. 9b), and appear to have been ascribed to David (Acts iv. 25).

The opinion of Jerome (*Præf. in Ps. Heb.*) and other Christian writers that the collector of the Psalter was Ezra does not seem to rest on Jewish tradition.

Nature and Origin of the Collection.—Whatever may be the value of the titles to individual psalms, there can be no question that the tradition that the Psalter was collected by David is not historical; for no one doubts that some of the psalms date from after the Babylonian exile. The truth that underlies the tradition is that the collection is essentially the hymn-book of the second temple, and it was therefore ascribed to David, because it was assumed, as we see clearly from Chronicles, that the order of worship in the second temple was the same as in the first, and had David as its father: as Moses completed the law of Israel for all time before the people entered Canaan, so David completed the theory and contents of the temple psalmody before the temple itself was built. When we thus understand its origin, the tradition becomes really instructive, and may be translated into a statement which throws light on a number of points connected with the book, namely, that the Psalter was (finally, at least) collected with a liturgical purpose. Thus, though the Psalms represent a great range of individual religious experience, they avoid such situations and expressions as are too unique to be used in acts of public devotion. Many of the psalms are doxologies or the like, expressly written for the temple; others are made up of extracts from older poems in a way perfectly natural in a hymn-book, but otherwise hardly intelligible. Such ancient hymns as Exod. xv. 1 sq., Judges v., 1 Sam. ii. 1 sq., are not included in the collection, though motives borrowed from them are embodied in more modern psalms; the interest of the collector, we see, was not historical but liturgical. Again, the temple, Zion, the solemn feasts, are constantly kept in the foreground. All these points go to show that the collection was not only used but actually formed for use in the temple.

The question now arises, Was the collection a single act or is the Psalter made up of several older collections? And here we have first to observe that in the Hebrew text the Psalter is divided into five books, each of which closes with a doxology. The scheme of the whole is as follows:—

Book I., Pss. i.-xli.: all these are ascribed to David except i., ii., x. (which is really part of ix.), xxxiii. (ascribed to David in LXX.); *doxology*, xli. 13. Book II., Pss. xlii.-lxxii.: of these xlii.-xliv. are ascribed to the Korahites (xlii. being part of xlii.), l. to Asaph, li.-lxxi. to David (except lxvi., lxvii., lxxi. anonymous; in LXX. the last two bear David's name), lxxii. to Solomon; *doxology*, lxxii. 13, 19 followed by the subscription “The prayers of David the son of Jesse are ended.” Book III., Pss. lxxiii.-lxxxix.: here lxxiii.-lxxxiii. bear the name of Asaph, lxxxiv., lxxxv., lxxxvii., lxxxviii. that of the Korahites, lxxxvi. of David, lxxxviii. of Heman, lxxxix. of Ethan; *doxology*, lxxxix. 52. Book IV., Pss. xc.-cvi.: all are anonymous except xc. (Moses), ci., ciii. (David), —LXX. gives also civ. to David; here the doxology is peculiar, “Blessed be Jehovah God of Israel from everlasting and to everlasting. And let all the people say Amen, Hallelujah.” Book V., Pss. cvii.-cl.: of these cvii.-cx., cxxii., cxxiv., cxxxi., cxxxiii., cxxxviii.-cxlv. are ascribed to David, and cxxvii. to Solomon, and cxx.-cxxxiv. are pilgrimage psalms; LXX. varies considerably from the Hebrew as to the psalms to be ascribed to David; the book closes with a group of doxological psalms.

The division into five books was known to Hippolytus, but a closer examination of the doxologies shows that it does not represent the original scheme of the Psalter; for, while the doxologies to the first three books are no part of the psalms to which they are attached, but really mark the end of a book in a pious fashion not uncommon in Eastern literature, that to book iv. with its rubric addressed to the people plainly belongs to the psalm, or rather to its liturgical execution, and does not therefore really mark the close of a

¹ Hippol., ed. Lag., p. 188; Euseb., *H. E.*, vi. 25, 2; Epiph., *Mens. et Pond.*, § 23; Jerome's preface to *Psalt. iuxta Hebræos*.

² Similarly in the Syriac Bible the title is “mazmôrâ.”

³ The passages are collected in Kimhi's preface to his commentary on the Psalms, ed. Schiller-Szinessy, Cambridge, 1883.

⁴ *Opp.*, ii. 514 sq., ed. Rue; cp. Hippol., *ut supra*; Jerome, *Ep. CXL. (ad Cypri.)*, and *Præf. in Mat.*

collection once separate. In point of fact books iv. and v. have so many common characters that there is every reason to regard them as a single great group. Again, the main part of books ii. and iii. (Pss. xlii.-lxxxiii.) is distinguished from the rest of the Psalter by habitually avoiding the name Jehovah (the Lord) and using Elohim (God) instead, even in cases like Ps. l. 7, where "I am Jehovah thy God" of Exod. xx. 2 is quoted but changed very awkwardly to "I am God thy God." This is not due to the authors of the individual psalms, but to an editor; for Ps. liii. is only another recension of Ps. xiv., and Ps. lxx. repeats part of Ps. xl., and here Jehovah is six times changed to Elohim, while the opposite change happens but once. The Elohim psalms, then, have undergone a common editorial treatment distinguishing them from the rest of the Psalter. And they make up the mass of books ii. and iii., the remaining psalms, lxxxiv.-lxxxix., appearing to be a sort of appendix. But when we look at the Elohim psalms more nearly we see that they contain two distinct elements, Davidic psalms and psalms ascribed to the Levitical choirs (sons of Korah, Asaph). The Davidic collection as we have it splits the Levitical psalms into two groups and actually divides the Asaphic Ps. l. from the main Asaphic collection, lxxiii.-lxxxiii. This order can hardly be original, especially as the Davidic Elohim psalms have a separate subscription (Ps. lxxii. 20). But if we remove them we get a continuous body of Levitical Elohim psalms, or rather two collections, the first Korahitic and the second Asaphic, to which there have been added by way of appendix by a non-Elohistic editor a supplementary group of Korahite psalms and one psalm (certainly late) ascribed to David. The formation of books iv. and v. is certainly later than the Elohistic redaction of books ii. and iii., for Ps. cviii. is made up of two Elohim psalms (lvii. 7-11, lx. 5-12) in the *Elohistic form*, though the last two books of the Psalter are generally Jehovistic. We can thus distinguish the following steps in the redaction:—(a) the formation of a Davidic collection (book i.) with a closing doxology; (b) a second Davidic collection (li.-lxii.) with doxology and subscription; (c) a twofold Levitical collection (xlii.-xliv.; l., lxxiii.-lxxxiii.); (d) an Elohistic redaction and combination of (b) and (c); (e) the addition of a non-Elohistic supplement to (d) with a doxology; (f) a collection later than (d), consisting of books iv., v. And finally the anonymous psalms i., ii., which as anonymous were hardly an original part of book i., may have been prefixed after the whole Psalter was completed. We see too that it is only in the latest collection (books iv., v.) that anonymity is the rule, and titles, especially titles with names, occur only sporadically. Elsewhere the titles run in series and correspond to the limits of older collections.

Date of the Collection.—A process of collection which involves so many stages must plainly have taken a considerable time, and the question arises whether we can fix a limit for its beginning and end or even assign a date for any one stage of the process. An inferior limit for the final collection is given by the Septuagint translation. But this translation itself was not written all at once, and its history is obscure; we only know from the prologue to Ecclesiasticus that the Hagiographa, and doubtless therefore the Psalter, were read in Greek in Egypt about 130 B.C. or somewhat later.¹ And the Greek Psalter, though it contains one apocryphal psalm at the close, is essentially the same as the Hebrew; there is nothing to suggest that the Greek was first translated from a less complete Psalter and afterwards extended to agree with

the extant Hebrew. It is therefore reasonable to hold that the Hebrew Psalter was completed and recognized as an authoritative collection long enough before 130 B.C. to allow of its passing to the Greek-speaking Jews in Alexandria. Beyond this the external evidence for the completion of the collection does not carry us. It appears indeed from 1 Chron. xvi., 2 Chron. vi. 41, 42, that various psalms belonging to books iv. and v. were current in the time of the Chronicler,—that is, towards the close of the Persian or more probably in the earlier part of the Greek period. But it is not certain that the psalms he quotes (xcvi., cv., cvi., cxxxii.) already existed in their place in our Psalter, or that Ps. cvi. even existed in its present form. Turning now to internal evidence, we find the surest starting-point in the Levitical psalms of the Elohistic collection. These, as we have seen, form two groups, referred to the sons of Korah and to Asaph. At the beginning of the Greek period or somewhat later Asaph was taken to be a contemporary of David and chief of the singers of his time (Neh. xii. 46), or one of the three chief singers belonging to the three great Levitical houses (1 Chron. xxv. 1 sq.). But the older history knows nothing of an individual Asaph; at the time of the return from Babylon the guild of singers as a whole was called Bnê Asaph (Ezra ii. 41), and so apparently it was in the time of Nehemiah (Neh. xi. 22, Heb.).² The singers or Asaphites are at this time still distinguished from the Levites; the oldest attempt to incorporate them with that tribe appears in Exod. vi. 24, where Abiasaph—that is, the eponym of the guild of Asaphites—is made one of the three sons of Korah. But when singers and Levites were fused the Asaphites ceased to be the only singers, and ultimately, as we see in Chronicles, they were distinguished from the Korahites and reckoned to Gershom (1 Chron. vi.), while the head of the Korahites is Heman, as in the title of Ps. lxxxviii. It is only in the appendix to the Elohistic psalm-book that we find Heman and Ethan side by side with Asaph, as in the Chronicles, but the body of the collection distinguishes between two guilds of singers, Korahites and Asaphites, and is therefore as a collection younger than Nehemiah, but presumably older than Chronicles with its three guilds.

The contents of the Korahite and Asaphic psalms give no reason to doubt that they really were collected by or for these two guilds. Both groups are remarkable by the fact that they hardly contain any recognition of present sin on the part of the community of Jewish faith—though they do confess the sin of Israel in the past—but are exercised with the observation that prosperity does not follow righteousness either in the case of the individual (xlix., lxxiii.) or in that of the nation, which suffers notwithstanding its loyalty to God, or even on account thereof (xliv., lxxix.). Now the rise of the problems of individual faith is the mark of the age that followed Jeremiah, while the confident assertion of national righteousness under misfortune is a characteristic mark of pious Judaism after Ezra, in the period of the law but not earlier. Malachi, Ezra, and Nehemiah, like Haggai and Zechariah, are still very far from holding that the sin of Israel lies all in the past. Again, a considerable number of these psalms (xliv., lxxiv., lxxix., lxxx.) point to an historical situation which can be very definitely realized. They are post-exile in their whole tone and belong to a time when prophecy had ceased and the synagogue worship was fully established (lxxiv. 8, 9). But the Jews are no longer the obedient

¹ The text of the passage is obscure and in part corrupt, but the Latin "cum multum temporis ibi fuisset" probably expresses the author's meaning. A friend has suggested to the writer that for συγγραφείας we ought perhaps to read συχρὸν ἐγγραφείας.

² The threefold division of the singers appears in the same list according to the Hebrew text of ver. 17, but the occurrence of Jeduthun as a proper name instead of a musical note is suspicious, and makes the text of LXX. preferable. The first clear trace of the triple choir is therefore in Neh. xii. 24, i.e., not earlier than Alexander the Great, with whom Jaddua (ver. 22) was contemporary.

slaves of Persia; there has been a national rising and armies have gone forth to battle. Yet God has not gone forth with them: the heathen have been victorious, blood has flowed like water round Jerusalem, the temple has been defiled, and these disasters assume the character of a religious persecution. These details would fit the time of religious persecution under Antiochus Epiphanes, to which indeed Ps. lxxiv. is referred (as a prophecy) in 1 Mac. vii. 16. But against this reference there is the objection that these psalms are written in a time of the deepest dejection and yet are psalms of the temple choirs. Now when the temple was reopened for worship after its profanation by Antiochus the Jews were victorious and a much more joyous tone was appropriate. Besides, if the psalms are of the Maccabee period, they can have been no original part of the Elohist psalm-book, which certainly was not collected so late. But there is one and only one time in the Persian period to which they can be referred, viz., that of the great civil wars under Artaxerxes III. Ochus (middle of 4th century B.C.). See PERSIA, vol. xviii. p. 580, and PHENICIA, *ib.* p. 809. The Jews were involved in these and were severely chastised, and we know from Josephus that the temple was defiled by the Persians and humiliating conditions attached to the worship there. It would appear that to the Jews the struggle took a theocratic aspect, and it is not impossible that the hopeful beginnings of a national movement, which proved in the issue so disastrous, are reflected in some of the other pieces of the collection.¹ All this carries the collection of the Elohist psalm-book down to quite the last years of the Persian period at the earliest, and with this it agrees—to name but one other point—that the view of Israel's past history taken in Ps. lxxviii., where the final rejection of the house of Joseph is co-ordinated with the fall of Shiloh and the rise of Zion and the Davidic kingdom, indicates a standpoint very near to that of Chronicles. The fusion of the separate Korahite and Asaphic psalm-books in a single collection along with the second group of Davidic psalms may very probably be connected with the remodelling of the singers in three choirs which Chronicles presupposes.

Now books iv. and v. are, as we have seen, later than the Elohist redaction of books ii. and iii., so that the collection of the last part of the Psalter must, if our argument up to this point is sound, be thrown into the Greek period, and probably not the earliest part thereof. And this conclusion is borne out by a variety of indications. First of all, the language of some of these psalms clearly points to a very late date indeed.² The Jews had even in the time of Nehemiah (Neh. xiii. 24) been in danger of forgetting their own tongue and adopting a jargon compounded with neighbouring idioms; but the restorers of the law fought against this tendency with vigour and with so much success that very tolerable Hebrew was written for at least a century longer. But in such a psalm as cxxxix. the language is a real jargon, a mixture of Hebrew and Aramaic, which, in a hymn accepted for use in the temple, shows the Hebrew speech to have reached the last

stage of decay. Again, though no part of the Psalter shows clearer marks of a liturgical purpose, we find that in books iv. and v. the musical titles have entirely disappeared. The technical terms, that is, of the temple music which are still recognized by the Chronicler have gone out of use, presumably because they were already become unintelligible, as they were when the Septuagint version was made. This implies a revolution in the national music which we can hardly explain in any other way than by the influence of that Hellenic culture which, from the time of the Macedonian conquest, began to work such changes on the whole civilization and art of the East. Once more the general tone of large parts of this collection is much more cheerful than that of the Elohist psalm-book. It begins with a psalm (xc.) ascribed in the title to Moses, and seemingly designed to express feelings appropriate to a situation analogous to that of the Israelites when, after the weary march through the wilderness, they stood on the borders of the promised land. It looks back on a time of great trouble and forward to a brighter future. In some of the following psalms there are still references to deeds of oppression and violence, but more generally Israel appears as happy under the law with such a happiness as it did enjoy under the Ptolemies during the 3d century B.C. The problems of divine justice are no longer burning questions; the righteousness of God is seen in the peaceful felicity of the pious (xci., xcii., &c.). Israel, indeed, is still scattered and not triumphant over the heathen, but even in the dispersion the Jews are under a mild rule (cvi. 46), and the commercial activity of the nation has begun to develop beyond the seas (cvii. 26 *sq.*). The whole situation and vein of piety here are strikingly parallel to those shown in Ecclesiasticus, which dates from the close of the Ptolemaic sovereignty in Palestine. But some of the psalms carry us beyond this peaceful period to a time of struggle and victory. In Ps. cxviii. Israel, led by the house of Aaron—this is a notable point—has emerged triumphant from a desperate conflict and celebrates at the temple a great day of rejoicing for the un hoped-for victory; in Ps. cxlix. the saints are pictured with the praises of God in their throat and a sharp sword in their hands to take vengeance on the heathen, to bind their kings and nobles, and exercise against them the judgment written in prophecy. Such an enthusiasm of militant piety, plainly based on actual successes of Israel and the house of Aaron, can only be referred to the first victories of the Maccabees, culminating in the purification of the temple in 165 B.C. This restoration of the worship of the national sanctuary under circumstances that inspired religious feelings very different from those of any other generation since the return from Babylon might most naturally be followed by an extension of the temple psalmody; it certainly was followed by some liturgical innovations, for the solemn service of dedication on the twenty-fifth day of Chisleu was made the pattern of a new annual feast (that mentioned in John x. 22). Now in 1 Mac. iv. 54 we learn that the dedication was celebrated with hymns and music. In later times the psalms for the *encenia* or feast of dedication embraced Ps. xxx. and the *hallel* Pss. cxiii.-cxviii. There is no reason to doubt that these were the very psalms sung in 165 B.C., for in the title of Ps. xxx. the words “the song for the dedication of the house,” which are a somewhat awkward insertion in the original title, are found also in the LXX., and therefore are probable evidence of the liturgical use of the psalm in the very first years of the feast. But no collection of old psalms could fully suffice for such an occasion, and there is every reason to think that the *hallel*, which especially in its closing part contains allusions that fit no other time so well, was first arranged for the same ceremony. The course of the subsequent history makes

¹ Ps. lxxxiii., in which Judah is threatened by the neighbouring states acting with the support rather than under the guidance of Asshur (the satrap of Syria?) is also much more easily understood under the loose rule of Persia than under the Greeks, and the association of Tyre with Philistia (as in lxxxvii. 4) agrees with Pseudo-Scylax (see vol. xviii. p. 809). If this psalm has a definite historical background, which many critics doubt, it must be later than the destruction of Sidon by Ochus. That it is not of the Assyrian age is obvious from the mention of Arab tribes.

² For details as to the linguistic phenomena of the Psalms, see especially Giesebrecht in Stade's *Zeitschr.*, 1881, p. 276 *sq.* The objections of Driver (*Journ. of Phil.*, xi. 283) do not touch the argument that such psalms as cxxxix. belong to the very latest stage of Biblical Hebrew.

it very intelligible that the Psalter was finally closed, as we have seen from the date of the Greek version that it must have been, within a few years at most after this great event.¹ From the time of Hyrcanus downwards the ideal of the princely high priests became more and more divergent from the ideal of the pious in Israel, and in the Psalter of Solomon we see religious poetry turned against the lords of the temple and its worship. (See MESSIAH.)

All this does not, of course, imply that there are not in books iv. and v. any pieces older than the completion of books ii. and iii., for the composition of a poem and its acceptance as part of the Levitical liturgy are not necessarily coincident in date, except in psalms written with a direct liturgical purpose. In the fifteen "songs of degrees" (Pss. cxx.-cxxxiv.) we have a case in point. According to the Mishna (*Middoth*, ii. 5) and other Jewish traditions, these psalms were sung by the Levites at the Feast of Tabernacles on the fifteen steps or degrees that led from the women's to the men's court. But when we look at the psalms themselves we see that they must originally have been a hymn-book, not for the Levites, but for the laity who came up to Jerusalem at the great pilgrimage feasts; and the title of this hymn-book (which can be restored from the titles derived from it that were prefixed to each song when they were taken into the Levitical connexion) was simply "Pilgrimage Songs."² All these songs are plainly later than the exile; but some of them cannot well be so late as the formation of the Elohistie psalm-book, and the simple reason why they are not included in it is that they were hymns of the laity, describing with much beauty and depth of feeling the emotions of the pilgrim when his feet stood within the gates of Jerusalem, when he looked forth on the encircling hills, when he felt how good it was to be camping side by side with his brethren on the slopes of Zion (cxxxiii.), when a sense of Jehovah's forgiving grace and the certainty of the redemption of Israel triumphed over all the evils of the present and filled his soul with humble and patient hope.

The titles which ascribe four of the pilgrimage songs to David and one to Solomon are lacking in the true LXX., and inconsistent with the contents of the psalms. Better attested, because found in the LXX. as well as in the Hebrew, and therefore probably as old as the collection itself, are the name of Moses in Ps. xc. and that of David in Pss. ci., cii., cviii.-cx., cxxviii.-cxl. But where did the last collectors of the Psalms find such very ancient pieces which had been passed by by all previous collectors, and what criterion was there to establish their genuineness? No canon of literary criticism can treat as valuable external evidence an attestation which first appears so many centuries after the supposed date of the poems, especially when it is confronted by facts so conclusive as that Ps. cviii. is made up of extracts from Pss. lvii. and lx. and that Ps. cxxxix. is marked by its language as one of the latest pieces in the book. The only possible question for the critic is whether the ascription of these psalms to David was due to the idea that he was the psalmist *par excellence*, to whom any poem of unknown origin was naturally ascribed, or whether we have in some at least of these titles an example of the habit so common in later Jewish literature of writing in the name of ancient worthies. In the case of Ps. xc. it can hardly be doubted that this is the real explanation, and the same account must be given of the title in Ps. cxlv., if, as seems probable, it is meant to cover the whole of the great *hallel* or *tehilla* (Ps. cxlv.-cl.), which must, from

the allusions in Ps. cxlix., as well as from its place, be almost if not quite the latest thing in the Psalter.

Davidic Psalms.—For the later stages of the history of the Psalter we have, as has been seen, a fair amount of circumstantial evidence pointing to conclusions of a pretty definite kind. The approximate dates which their contents suggest for the collection of the Elohistie psalm-book and of books iv. and v. confirm one another and are in harmony with such indications as we obtain from external sources. But, in order to advance from the conclusions already reached to a view of the history of the Psalter as a whole, we have still to consider the two great groups of psalms ascribed to David in books i. and ii. Both these groups appear once to have formed separate collections and in their separate form to have been ascribed to David; for in book i. every psalm, except the introductory poems i. and ii. and the late Ps. xxxiii., which may have been added as a liturgical sequel to Ps. xxxii., bears the title "of David," and in like manner the group Pss. li.-lxxii., though it contains a few anonymous pieces and one psalm which is either "of" or rather according to the oldest tradition "for Solomon," is essentially a Davidic hymn-book, which has been taken over as a whole into the Elohistie Psalter, even the subscription lxxii. 20 not being omitted. Moreover, the collectors of books i.-iii. knew of no Davidic psalms outside of these two collections, for Ps. lxxxvi. in the appendix to the Elohistie collection is merely a cento of quotations from Davidic pieces with a verse or two from Exodus and Jeremiah. These two groups, therefore, represented to the collectors the oldest tradition of Hebrew psalmody; they are either really Davidic or they passed as such. This fact is important; but its weight may readily be over-estimated, for the Levitical psalms comprise poems of the last half-century of the Persian empire, and the final collection of books ii. and iii. may fall a good deal later. Thus the tradition that David is the author of these two collections comes to us, not exactly from the time of the Chronicler, but certainly from the time when the view of Hebrew history which he expresses was in the course of formation. And it is not too much to say that that view—which to some extent appears in the historical psalms of the Elohistie Psalter—implies absolute incapacity to understand the difference between old Israel and later Judaism and makes almost anything possible in the way of the ascription of comparatively modern pieces to ancient authors. Nor will it avail to say that this uncritical age did not ascribe the Psalms to David but accepted them on the ground of older titles, for it is hardly likely that each psalm in the Davidic collections had a title before it was transferred to the larger Psalter; and in any case the titles are manifestly the product of the same uncritical spirit as we have just been speaking of, for not only are many of the titles certainly wrong but they are wrong in such a way as to prove that they date from an age to which David was merely the abstract psalmist, and which had no idea whatever of the historical conditions of his age. For example, Pss. xx., xxi. are not spoken by a king but addressed to a king by his people; Pss. v., xxvii. allude to the temple (which did not exist in David's time), and the author of the latter psalm desires to live there continually. Even in the older Davidic psalm-book there is a whole series of hymns in which the writer identifies himself with the poor and needy, the righteous people of God suffering in silence at the hands of the wicked, without other hope than patiently to wait for the interposition of Jehovah (Pss. xii., xxv., xxxvii., xxxviii., &c.). Nothing can be farther removed than this from any possible situation in the life of the David of the books of Samuel, and the case is still worse in the second Davidic collection, especially where we have in the titles

¹ Possibly under Simon; compare the other *hallel* (Ps. cxlvi.-cl.) with 1 Mac. xiii. 50 sq.

² שיר המעלות as in Ezra vii. 9 seems to be properly a plural like בית האבות.

definite notes as to the historical occasion on which the poems are supposed to have been written. To refer Ps. liii. to Doeg, Ps. liv. to the Ziphites, Ps. lix. to David when watched in his house by Saul, implies an absolute lack of the very elements of historical judgment. Even the bare names of the old history were no longer correctly known when Abimelech (the Philistine king in the stories of Abraham and Isaac) could be substituted in the title of Ps. xxxiv. for Achish, king of Gath. In a word, the ascription of these two collections to David has none of the characters of a genuine historical tradition.

At the same time it is clear that the two collections do not stand on quite the same footing. The Elohist redaction—the change in the names of God—extends only to the second. Now the formation of the Elohist Psalter must have been an official act directed to the consolidation of the liturgical material of the temple, and if it left one of the so-called Davidic collections untouched the reason must have been that this collection had already a fixed liturgical position. In other words, book i. is the oldest extant liturgy of the second temple, while there is no evidence that the Davidic psalms of book ii. had a fixed liturgical place till at least the close of the Persian period.

And now the question arises: May we suppose that the oldest liturgy of the second temple was also the liturgy of the temple of Solomon? We have it in evidence that music and song accompanied the worship of the great sanctuaries of northern Israel in the 8th century B.C. (Amos v. 23), but from the context it appears probable that the musicians were not officers of the temple but rather the worshippers at large (compare Amos vi. 5). So it certainly was in the days of David (2 Sam. vi. 5) and even of Isaiah (xxx. 29); the same thing is implied in the song of Hezekiah (Isa. xxxviii. 20), and in Lam. ii. 7 the noise within the sanctuary on a feast-day which affords a simile for the shouts of the victorious Chaldeans suggests rather the untrained efforts of the congregation than the disciplined music of a temple choir. The allusion to "chambers of singers" in Ezek. xl. 44 is not found in the Septuagint text, which is justified by the context, and the first certain allusion to a class of singers belonging to the sacred ministers is at the return from Babylon (Ezra ii. 41). The way in which these singers, the sons of Asaph, are spoken of may be taken as evidence that there was a guild of temple singers before the exile; but they cannot have been very conspicuous or we should have heard more of them. The historical books, as edited in the captivity, are fond of varying the narrative by the insertion of lyrical pieces, and one or two of these—the "passover song" (Exod. xv.) and perhaps the song from the book of Jashar ascribed to Solomon (see vol. xi. p. 598)—look as if they were sung in the first temple; but they are not found in the Psalter, and, conversely, no piece from the Psalter is used to illustrate the life of David except Ps. xviii., and it occurs in a section which can be shown to be an interpolation in the original form of 2 Samuel. These facts seem to indicate that even book i. of the Psalter did not exist when the editing of the historical books was completed, and that in music as in other matters the ritual of the second temple was completely reconstructed. Indeed the radical change in the religious life of the nation caused by the captivity could not fail to influence the psalmody of the sanctuary more than any other part of the worship; the book of Lamentations marks an era of profound importance in the religious poetry of Israel, and no collection formed before these dirges were first sung could have been an adequate hymn-book for the second temple. In point of fact the notes struck in the Lamentations and in Isa. xl.-lxvi. meet our ears again in not a few psalms of book i., e.g., Pss. xxii., xxv., where the closing prayer for the redemption of Israel in a

verse additional to the acrostic perhaps gives, as Lagarde suggests, the characteristic post-exile name *Pedaiah* as that of the author; Ps. xxxi., with many points of resemblance to Jeremiah; Pss. xxxiv., xxxv., where the "servant of Jehovah" is the same collective idea as in Deutero-Isaiah; and Pss. xxxviii., xli. The key to many of these psalms is that the singer is not an individual but, as in Lam. iii., the true people of God represented as one person; and only in this way can we do justice to expressions which have always been a stumbling-block to those who regard David as the author. But, at the same time, other psalms of the collection treat the problems of individual religion in the line of thought first opened by Jeremiah. Such a psalm is xxxix., and above all Ps. xvi. Other pieces, indeed, may well be earlier. When we compare Ps. viii. with Job vii. 17, 18, we can hardly doubt that the psalm lay before the writer who gave its expressions so bitter a turn in the anguish of his soul, and Pss. xx., xxi. plainly belong to the old kingdom. But on the whole it is not the pre-exilic pieces that give the tone to the collection; whatever the date of this or that individual poem, the collection as a whole—whether by selection or authorship—is adapted to express a religious life of which the exile is the presupposition. Only in this way can we understand the conflict and triumph of spiritual faith, habitually represented as the faith of a poor and struggling band living in the midst of oppressors and with no strength or help save the consciousness of loyalty to Jehovah, which is the fundamental note of the whole book.

Whether any of the older poems really are David's is a question more curious than important, as, at least, there is none which we can fit with certainty into any part of his life. If we were sure that 2 Sam. xxii. was in any sense part of the old tradition of David's life, there would be every reason to answer the question in the affirmative, as has been done by Ewald (see *DAVID*); but the grave doubts that exist on this point throw the whole question into the region of mere conjecture.

The contents of book i. make it little probable that it was originally collected by the temple ministers, whose hymn-book it ultimately became. The singers and Levites were ill provided for, and consequently irregular in their attendance at the temple, till the time of Nehemiah, who made it his business to settle the revenues of the clergy in such a way as to make regular service possible. With regular service a regular liturgy would be required, and in the absence of direct evidence it may be conjectured that the adoption of the first part of the Psalter for this purpose took place in connexion with the other far-reaching reforms of Ezra and Nehemiah, which first gave a stable character to the community of the second temple. In any case these psalms, full as they are of spiritual elements which can never cease to be the model of true worship, are the necessary complement of the law as published by Ezra, and must be always taken along with it by those who would understand what Judaism in its early days really was, and how it prepared the way for the gospel.

The second Davidic collection, which begins with a psalm of the exile (Ps. li.; see the last two verses), contains some pieces which carry us down to a date decidedly later than that of Nehemiah. Thus Ps. lxviii. 27 represents the worshipping congregation as drawn partly from the neighbourhood of Jerusalem and partly from the colony of Galilee. In several psalms of this collection, as in the Levitical psalms with which it is coupled, we see that the Jews have again begun to feel themselves a nation and not a mere municipality, though they are still passing through bitter struggles; and side by side with this there is a development of Messianic hope, which in Ps. lxxii. takes a

wide sweep, based on the vision of Deutero-Isaiah. All these marks carry us down for this as for the other collections of the Elohist Psalter to the time when passive obedience to the Achæmenians was interrupted. Several points indicate that the collection was not originally formed as part of the temple liturgy. The title, as preserved in the subscription to Ps. lxxii. 20, was not "Psalms" but "Prayers of David." Again, while the Levitical psalms were sung in the name of righteous Israel, of which, according to the theory of the second temple, the priestly and Levitical circles were the special holy representatives, these Davidic psalms contain touching expressions of contrition and confession (li., lxv.). And, while there are direct references to the temple service, these are often made from the standpoint, not of the ministers of the temple, but of the laity who come up to join in the solemn feasts or appear before the altar to fulfil their vows (Pss. liv. 6, lv. 14, lxiii., lxvi. 13, &c.). Moreover, the didactic element so prominent in the Levitical psalms is not found here.

Such is the fragmentary and conjectural outline which it seems possible to supply of the history of the two Davidic collections, from which it appears that the name of David which they bear is at least so far appropriate as it marks the generally non-clerical origin of these poems. But the positive origin of this title must be sought in another direction and in connexion with book i. From the days of Amos, and in full accordance with the older history, the name of David had been connected with musical skill and even the invention of musical instruments (Amos vi. 5). In the days of Nehemiah, though we do not hear of psalms of David,¹ we do learn that instruments of the singers were designated as Davidic, and the epithet "man of God" (Neh. xii. 36) probably implies that agreeably with this David was already regarded as having furnished psalms as well as instruments. But it was because the temple music was ascribed to him that the oldest liturgy came to be known in its totality as "Psalms of David," and the same name was extended to the lay collection of "Prayers of David," while the psalms whose origin was known because they had always been temple psalms were simply named from the Levitical choirs, or at a later date had no title.

Musical Execution and Place of the Psalms in the Temple Service.—The musical notes found in the titles of the psalms and occasionally also in the text (Selah, Higgaion) are so obscure that it seems unnecessary to enter here upon the various conjectures that have been made about them. The clearest point is that a number of the psalms were set to melodies named after songs,² and that one of these songs, beginning מִתְחַלֵּל (Al-taschith in E.V., Ps. lvii. sq.), may be probably identified with the vintage song, Isa. lxv. 8. The temple music was therefore apparently based on popular melodies. A good deal is said about the musical services of the Levites in Chronicles, both in the account given of David's ordinances and in the descriptions of particular festival occasions. But unfortunately it has not been found possible to get from these accounts any clear picture of the ritual or any certainty as to the technical terms used. By the time of the Septuagint these terms were no longer understood; it is not quite clear whether even the Chronicler understood them fully.

The music of the temple attracted the attention of Theophrastus (ap. Porph., *De Abst.*, ii. 26), who was perhaps the first of the Greeks to make observations on the Jews. His description of the temple ritual is not strictly accurate, but he speaks of the worshippers as passing the night in gazing at the stars and calling on God in prayer; his words, if they do not exactly fit anything in the later ritual, are well fitted to illustrate the original liturgical use of Pss. viii., cxxxiv. Some of the Jewish traditions as to the use of particular psalms have been already cited; it may be added that the Mishna (*Tamid*) assigns to the service of the continual

burnt-offering the following weekly cycle of psalms.—(1) xxiv., (2) xlviii., (3) lxxxii., (4) xciv., (5) lxxx., (6) xciii., (Sabbath) xcii., as in the title. Many other details are given in the treatise *Sôferim*, but these for the most part refer primarily to the synagogue service after the destruction of the temple. For details on the liturgical use of the Psalter in Christendom the reader may refer to Smith's *Dict. Chr. Ant.*, s.v. "Psalmody."

Ancient Versions.—A. The oldest version, the LXX., follows a text generally closely corresponding to the Massoretic Hebrew, the main variations being in the titles and in the addition (lacking in some MSS.) of an apocryphal psalm ascribed to David when he fought with Goliath. Pss. ix. and x. are rightly taken as one psalm, but conversely Ps. cxlvii. is divided into two. The LXX. text has many "daughters," of which may be noticed (a) the Memphitic (ed. Lagarde, 1875); (b) the old Latin, which as revised by Jerome in 383 after the current Greek text forms the *Psalterium Romanum*, long read in the Roman Church and still used in St Peter's; (c) various Arabic versions, including that printed in the polyglots of Le Jay and Walton, and two others of the four exhibited together in Lagarde's *Psalterium, Job, Proverbia, Arabice*, 1876; on the relations and history of these versions, see G. Hoffmann, in *Jenaische Literaturz.*, 1876, art. 539; the fourth of Lagarde's versions is from the Peshito. The Hexaplar text of the LXX., as reduced by Origen into greater conformity with the Hebrew by the aid of subsequent Greek versions,³ was further the mother (d) of the *Psalterium Gallicanum*,—that is, of Jerome's second revision of the Psalter (385) by the aid of the Hexaplar text; this edition became current in Gaul and ultimately was taken into the Vulgate (e) of the Syro-Hexaplar version (published by Bugati, 1820, and in facsimile from the famous Ambrosian MS. by Ceriani, Milan, 1874). B. The Christian Aramaic version or Peshito (Pshittā) is largely influenced by the LXX.: compare Baethgen, *Untersuchungen über die Psalmen nach der Peshitta*, Kiel, 1878 (unfinished). This version has peculiar titles taken from Eusebius and Theodore of Mopsuestia (see Nestle, in *Theol. Literaturz.*, 1876, p. 283). C. The Jewish Aramaic version or Targum is probably a late work. The most convenient edition is in Lagarde, *Hagiographa Chaldaica*, 1873. D. The best of all the old versions is that made by Jerome after the Hebrew in 405. It did not, however, obtain ecclesiastical currency—the old versions holding their ground, just as English churchmen still read the Psalms in the version of the "Great Bible" printed in their Prayer Book. This important version was first published in a good text by Lagarde, *Psalterium iuxta Hebraeos Hieronymi*, Leipzig, 1874.

Exegetical Works.—While some works of patristic writers are still of value for text criticism and for the history of early exegetical tradition, the treatment of the Psalms by ancient and mediæval Christian writers is as a whole such as to throw light on the ideas of the commentators and their times rather than on the sense of a text which most of them knew only through translations. For the Psalms as for the other books of the Old Testament the scholars of the period of the revival of Hebrew studies about the time of the Reformation were mainly dependent on the ancient versions and on the Jewish scholars of the Middle Ages. In the latter class Kimhi stands pre-eminent; to the editions of his commentary on the Psalms enumerated in the article KIMHI must now be added the admirable edition of Dr Schiller-Szinessy (Cambridge, 1893), containing unfortunately only the first book of his longer commentary. Among the works of older Christian scholars since the revival of letters, the commentary of Calvin (1557)—full of religious insight and sound thought—and the laborious work of M. Geier (1608, 1681 *et sequens*) may still be consulted with advantage, but for most purposes Rosenmüller's *Scholia in Pss.* (2d ed., 1821-22) supercedes the necessity of frequent reference to the predecessors of that industrious compiler. Of more recent works the freshest and most indispensable are Ewald's, in the first two half volumes of his *Dichter des alten Bundes* (2d ed., Göttingen, 1866; Eng. tr., 1880), and Olshausen's (1853). To these may be added (excluding general commentaries on the Old Testament) the two acute but wayward commentaries of Hitzig (1836, 1863-65), that of Delitzsch (1859-60, then in shorter form in several editions since 1867; Eng. tr., 1871), and that of Hupfeld (2d ed. by Riehm, 1897, 2 vols.). The last-named work, though lacking in original power and clearness of judgment, is extremely convenient and useful, and has had an influence perhaps disproportionate to its real exegetical merits. The question of the text was first properly raised by Olshausen, and has since received special attention from, among others, Lagarde (*Prophetæ Chalt.*, 1872, p. xlv. sq.), Dyserinck (in the "scholia" to his Dutch translation of the Psalms, *Theol. Tijdschr.*, 1878, p. 279 sq.), and Bickell (*Carmina V. T. metrica*, &c., Innsbruck, 1882), whose critical services are not to be judged merely by the measure of assent which his metrical theories may command. In English we have, among others, the useful work of Perowne (5th ed., 1883), that of Lowe and Jennings (2d ed., 1885), and the valuable translation of Cheyne (1884). The mass of literature on the Psalms is so enormous that no full list even of recent commentaries can be here attempted, much less an enumeration of treatises on individual psalms and special critical questions. For the latter Kuenen's *Onderzoek*, vol. iii., is, up to its date (1865), the most complete, and the new edition now in preparation will doubtless prove the standard work of reference. As regards the dates and historical interpretation of the Psalms, all older discussions, even those of Ewald, are in great measure antiquated by recent progress in Pentateuch criticism and the history of the canon, and an entirely fresh treatment of the Psalter by a sober critical commentator is urgently needed. (W. R. S.)

PSALTERY. For the mediæval instrument of this name ("sautrie" or "cembalo"), see PIANOFORTE (vol. xix. p. 65). The Hebrew בָּלָל, rendered ψαλτήριον,⁴ νάβλα, ψαλμός (Ps. lxxi. 22), καθάρα (Ps. lxxx. 2), ὄργανον (Am. v. 23, vi. 5), in the LXX., and "psaltery" or "viol" in the A.V. (also "lute" in the Prayer-Book version of the Psalms), appears to have been a small stringed instrument, harp or lyre, the strings of which were touched with the player's fingers. The statement of Josephus (*Ant.*, vii. 12, 3), that the κινύρα (קִנּוּרָה) had ten strings and was struck with the plectrum, while the νάβλα had twelve and was played with the hand, is the earliest definition having any authority to be met with of these obscure instruments. The κινύρα, if not a smaller lyre with tighter strings re-

¹ I.e., not in the parts of the book of Nehemiah which are by Nehemiah himself.

² Compare the similar way of citing melodies with the prep. 'al or 'al kālā, &c., in Syriac (Land, *Anecd.*, iv.; Ephr. Syr., *Hymni*, ed. Lamy).

³ See Field, *Origenis Hexapla*, where the fragments of these versions are collected. That of Symmachus is esteemed the best.

⁴ This word reappears in the קִנּוּרָה of Dan. iii. 5, &c.

quiring a plectrum, may, as some suppose, have been a kind of guitar, rather a tamboura, the most extensively known Eastern stringed instrument, which, in principle, is found represented in the oldest Egyptian monuments. The paucity of strings in the latter is, however, against this attribution. Nothing being more variable than the number of strings attached to the various stringed instruments at different times and in different places, eight, nine, or ten strings to the *κινύρα*, or ten (see Ps. xxxiii. 2, cxliv. 9, Heb.) or twelve to the *νάβλα*, are probably immaterial variations. The musical instruments of the Bible are the most difficult subject in musical archæology, about which the translators of the A.V. or the Prayer-Book Psalms did not trouble themselves, but named the instruments from those in use around them.

PSAMMETICHUS. See EGYPT, vol. vii. p. 743.

PSELLUS, the name of several Byzantine writers, of whom the following were the most important.

1. MICHAEL PSELLUS the elder, a native of Andros and a pupil of Photius. He flourished in the second half of the 9th century, and strove to stem the rising tide of barbarism by his devotion to letters and philosophy. His study of the Alexandrine theology, as well as of profane literature, brought him under the suspicions of the orthodox, and a former pupil of his, by name Constantine, accused him in an elegiac poem of having abandoned Christianity. In order to perfect his knowledge of Christian doctrine, Psellus had recourse to the instructions of Photius, and then replied to his adversary in a long iambic poem, in which he maintained his orthodoxy. It has been conjectured by Allatius, Cave, and others that some of the books commonly attributed to the younger Psellus are the works of the elder, e.g., the *Dialogue on Operations of Demons*, and the short treatises *On the Virtues of Stones* and *On Demons*. Their reasons, however, resting on the inferiority of literary style and mode of treatment, are inconclusive.

2. MICHAEL CONSTANTINE PSELLUS the younger was born at Constantinople in 1020, of a consular and patrician family. He studied at Athens, and by his talents and vast industry made himself master of all the learning of the age, including theology, law, physics, mathematics, philosophy, and history. At Constantinople he taught philosophy, rhetoric, and dialectic with the greatest success, and was honoured with the title of "Prince of Philosophers" by the emperors, who sometimes sought his advice and employed his services. But in 1078, when his pupil, the emperor Michael Ducas, was deposed, Psellus shared his downfall, being compelled by the new emperor, Nicephorus Botaniates, to retire to a monastery. On his accession to the empire in 1081 Alexius Comnenus deprived Psellus of his title of "Prince of Philosophers" and transferred it to his less talented rival John the Italian. He appears to have been still alive in 1105 and perhaps in 1110.

Of his works, which are very numerous, many have not yet been printed. Even of those which have been printed there is no complete edition. Of his published works we may mention—(1) his mathematical *Opus in quatuor Mathematicas Disciplinas, Arithmetica, Musica, Geometria, et Astronomia*, published at Venice in 1532, and several times reprinted, as at Basel in 1556 with the notes of Xylander; (2) a *Paraphrase of Aristotle's Περὶ ἔμπελας*, published in Greek by Aldus at Venice in 1503; (3) *Synopsis legum*, in iambic verse, edited with a Latin translation and notes by Franciscus Bosquetus, Paris, 1632; (4) *De Vitiis et Virtutibus, et Allegoriis*, in iambic verse, published by Arsenius at Rome (no date), and reprinted at Basel, 1544; (5) *Περὶ ἐνεργείας δαιμόνων διάλογος* (*De operatione demonum dialogus*), translated into Latin by Petrus Morellus and published at Paris in 1577; (6) *De lapidum virtutibus*, published in Greek and Latin at Toulouse in 1615 (for 5 and 6 see MICHAEL PSELLUS above).

PSUDONYMOUS LITERATURE. See BIBLIOGRAPHY, vol. iii. pp. 657-658.

PSKOFF, a government of the lake-region of north-west Russia, which extends from Lake Peipus to the source of the Dwina, having St Petersburg on the N., Novgorod, Tver, and Smolensk on the E., Vitebsk on the S., and Livonia on the W. It has an area of 16,678 square miles. In the south-east it extends partly over the Alaun heights—a broad ridge 800 to 1000 feet above the sea, deeply indented with numerous valleys and ravines, thickly covered with forests, and dotted with small lakes and ponds. In the district of Toropets these heights take the name of Vorobiovy Hills; extending westwards into Vitebsk, they send to the north a series of irregular ranges, separated by broad valleys, which occupy the north-western parts of Pskoff and give rise to the rivers flowing into Lakes Peipus and Ilmeñ. A depression 120 miles long and 35 miles broad, watered by the Lovat and Polist, occupies the interval between the two hilly tracts; it is covered throughout with forests and thickly studded with marshes overgrown with rank vegetation, the only tracts suitable for human occupation being narrow isolated strips of land on the banks of rivers, or between the marshes, and no communication is possible except along the watercourses. These marshy tracts, which extend westwards into Vitebsk and north-eastwards towards St Petersburg, were even more impassable ten centuries ago, and, encircling the old Russian city of Pskoff, formed its best protection against the repeated attacks of its neighbours.

With the exception of the south-eastern corner, where Carboniferous rocks make their appearance, nearly the whole of the government consists of Devonian deposits of great thickness,—the Old Red Sandstone, with subordinate layers of various sandstones, and clays containing brown iron ore; and the White Limestone, which contains layers of dolomite, marls, clays with deposits of gypsum, and white sandstone, which is extensively quarried for building purposes. As regards the fauna the Devonian deposits of Pskoff are intermediate between those of Belgium, the Eifel, and Poland and those of middle Russia. The whole is covered with very thick sheets of boulder clay and bears unmistakable traces of glacial action; the bottom moraine of the Scandinavian and Finnish ice-sheet formerly extended over the whole of this region, which often takes the shape of ridges (*kames* or *eskers*), the upper parts consisting of Glacial sands and post-Glacial clays, sands, and peat-bogs. The soil is thus not only infertile on the whole, but also badly drained, on account of the impermeable nature of the boulder clay and the frequent occurrence of depressions having no distinct outlets to the rivers. Only those parts of the territory which are covered with thicker strata of post-Glacial deposits are suitable for agriculture.

The rivers are numerous and belong to three separate basins—to Lakes Peipus and Pskoff the rivers in the north-west, to Lake Ilmeñ those in the middle, and to that of the Dwina the rivers in the south-east. A great number of small streams pour into Lake Pskoff, the chief being the Velikaya, which flows from south to north and receives numerous tributaries, which are used for floating rafts, a wide region being thus brought into communication with Lake Peipus and thence with the Narova. The Velikaya, which is now navigable for only 25 miles from Lake Pskoff, was formerly deeper. The Lovat and Shelon, belonging to the basin of Lake Ilmeñ, are both navigable, and a lively traffic is carried on on both; while the Dwina flows for 100 miles on the borders of the government or within it, and is used only for floating timber. There are no less than 850 lakes in Pskoff, with a total area of 391 square miles. The largest is Lake Pskoff, which is 50 miles long and 13 broad, and covers 312 square miles, having a depth of from 3 to 18 feet; it is connected by a channel, 40 miles

long and 3 to 10 wide, with Lake Peipus. Its islands, numbering nearly fifty, have an aggregate population of 2000 persons. The marshes on the banks of the Polist are nearly 1250 square miles in extent; one in the neighbourhood of Lake Dviniye is 27 miles long and 17 broad, and another on the Toropa extends for 17 miles, while many elongated marshes, 15, 20, and 30 miles long and from 2 to 3 broad, run parallel to one another in the broad depression of the Lovat. Forests occupy nearly one-half (about 45 per cent.) of the entire area, and in some districts (Cholm, Toropets, Porkhoff) as much as two-thirds of the surface. Large pine forests are met with in the north; in other parts the birch and aspen prevail; but almost one-quarter of the forest area is covered with low brushwood.

The climate is very moist and changeable. The average temperature is 41° Fahr. (17°·1 in January and 64°·8 in July).

The population of the government, which was 895,710 in 1881 (718,910 in 1863), consists almost exclusively of Great Russians, there being only 8000 Estonians (in the district of Pskoff), about 500 Letts, and less than 1500 Jews. Many German traders live at Pskoff. The Russians and the greater part of the Estonians belong to the Greek Church, or are Nonconformists (upwards of 12,000 in 1866, according to official figures). Of the total number of inhabitants only 58,900 live in towns, the remainder being distributed over no fewer than 15,000 small villages.

Notwithstanding the infertility of the soil the chief occupation is agriculture—rye, oats, barley, and potatoes being grown everywhere; but though corn is exported by the larger landowners to the average annual amount of nearly 1,600,000 bushels the amount imported is much greater (9,600,000 bushels). The annual export of flax is estimated at 530,000 cwts., Pskoff, Ostroff, Opotchka, Porkhoff, and Soltsey being important centres for the trade. The average annual crops during 1870-77 were 28,972,800 bushels of corn and 5,984,000 bushels of potatoes. The limited area of pasture lands is unfavourable for cattle-breeding, and in 1881 there were only 171,000 horses, 304,000 head of cattle, and 166,000 sheep; murrains are very frequent. Fishing is a considerable source of wealth on the shores of the larger lakes, small salted or frozen fish (*smolyetki*) being annually exported to the value of £25,000 or £35,000. The timber trade is steadily increasing, the exports being estimated at present at nearly £50,000; wood for fuel is, however, at the same time imported from the government of St Petersburg. The population engage also in the preparation of lime, in stone-quarrying, in the transport of merchandise, and in some domestic trades. The manufactures are insignificant; their aggregate production in 1879 reached £518,800, and gave occupation to only 2350 persons. The total amount of merchandise loaded and discharged on the rivers within the government in 1880 was 1,761,000 cwts.

Pskoff is divided into eight districts, the chief towns of which are—Pskoff (21,170 inhabitants), Cholm (5550), Novorjeff (1915), Opotchka (4075), Ostroff (4200), Porkhoff (3925), Toropets (5760), Velikiya Luki (6600), Alexandrovskii Posad (2920) and Soltsey (5825, an important shipping place on the Shelon river) have also municipal institutions.

PSKOFF, capital of the above government, is picturesquely situated on both banks of the broad Velikaya river, 9 miles from Lake Pskoff and 171 miles by rail south-west of St Petersburg. The chief part of the town, with its kremlin on a hill and several suburbs, occupies the right bank of the river, to which the ruins of its old walls descend; the Zapskovie, consisting of several suburbs, stretches along the same bank of the Velikaya below its confluence with the Pskova; and the Zavelitchie occupies the left bank of the Velikaya,—all three keeping their old historical names. The cathedral in the kremlin has been four times rebuilt since the 12th century and contains some very old shrines, as also the graves of the bishops of Pskoff and of several princes, including those of Dovmont and Vsevolod. The church of Dmitrii Solunskii also dates originally from the 12th century; there are others belonging to the 14th and 15th. The Spaso-Mirojskii monastery, founded in 1156, has many remarkable antiquities. The ruins of numerous rich and populous monasteries in or near the town attest its former wealth and greatness. The present town is ill built, chiefly of wood, and shows traces of decay. Many of the inhabitants live by agriculture

or gardening; the remainder are engaged in loading and unloading merchandise on the Velikaya and at the railway station, in combing flax, fishing, and domestic trades. The manufactures are unimportant. Since the completion of the St Petersburg and Warsaw railway the trade of Pskoff has increased. In 1880 the exports reached 99,000 cwts. on the Velikaya and 463,000 cwts. by rail; the imports were 125,700 cwts. on the Velikaya and 591,600 cwts. by rail. Pskoff has regular steam communication with Dorpat. The population in 1882 was 21,170 (15,086 in 1866).

History.—Pskoff, formerly the sister republic of Novgorod, and one of the oldest cities of Russia, maintained its independence and its free institutions until the 16th century, being thus the last to be brought under the rule of Moscow. Its annals, unquestionably the fullest and liveliest of any in Russia, affirm that it already existed in the time of Rurik; and Nestor mentions under the year 914 that Igor's wife, Olga, was brought from Pleskoff (*i.e.*, Pskoff). It was quite natural that a Russian fortified town should rise at the entrance of the Velikaya valley within the earliest period of the Russian colonization of that region; the river had from a remote antiquity been a channel for the trade of the south with the north Baltic coast. Pskoff being an important strategic point, its possession was obstinately disputed between the Russians and the Germans and Lithuanians, and throughout the 11th and 12th centuries numerous battles were fought. At that time the place had its own independent institutions; but, attacked as it was from the west, it became in the 12th century a "prigorod" of the Novgorod republic,—that is (so far as can be judged from the incomplete testimony of historical documents), a city having its own free institutions, but included in certain respects within the jurisdiction of the metropolis, and compelled in time of war to march against the common enemy. Pskoff had, however, its own prince (*defensor municipis*); and in the second half of the 13th century Prince (Timotheus) Dovmont fortified it so strongly, and was so successful in repelling its enemies, that the town acquired much importance and asserted its independence of Novgorod, with which in 1348 it concluded a treaty wherein the two republics were recognized as equals. The institutions of Pskoff resembled those of Novgorod; it, in its turn, had several prigorods, and its rule extended over the territory which now forms the districts of Pskoff, Ostroff, Opotchka, and Gdoff. Within this territory the "vyetche" or "forum" of Pskoff was sovereign, the vyetches of the subordinate towns being supreme in their own municipal affairs. The city of Pskoff was divided into several sections or "kontsy," according to the prevalent occupations of the inhabitants, and the kontsy were divided into "ulitsy" (streets), which enjoyed extensive powers of self-government. The vyetche was supreme in all affairs of general interest, as well as a supreme court of justice, and the princes were elected by it; these last had to defend the city and levied the taxes, which were assessed by twelve citizens, who combined to some extent the functions of judges with those of a jury. Pskoff differed widely, however, from Novgorod in the more democratic character of its institutions; and, while the latter constantly showed a tendency to become an oligarchy of the wealthier merchants, the former figured as a republic where the influence of the poorer classes prevailed. Its trading associations, supported by those of the labourers, checked the influence of the wealthier merchants.

This struggle (of which the annals give a lively picture) continued throughout the 14th and 15th centuries, resulting sometimes in armed riots. Notwithstanding these conflicts Pskoff was a very wealthy city. Its strong walls, whose ruins are still to be seen, its forty-two large and wealthy churches, built during this period, as also its numerous monasteries and its extensive trade, bear testimony to the wealth of the inhabitants, who then numbered about 60,000. The "dyetynets" or fort, enclosed by a stone wall erected by Dovmont, stood on a hill between the Pskova and the Velikaya, having within its walls the cathedral of the Holy Trinity. Another stone wall enclosed the commercial part, the Kromy (kremlin) or middle town. In 1465 the suburb Polonische became so prosperous that it also was enclosed by a wall, and included within the circuit of the town proper. Even the Zapskovie was enclosed by a wooden palisade in the 15th century and later on by a stone wall; while the Zavelitchie was a busy centre of foreign trade. As early as the 13th century Pskoff had become an important station for the trade between Novgorod and Riga. A century later it entered the Hanseatic League. Its merchants and trading associations had factories at Narva, Revel, Riga, and exported flax, corn, tallow, skins, tar, pitch, honey, and timber for shipbuilding, which were transported or shipped *via* Lake Peipus, the Narova, and the Embach to the ports on the Baltic and on the Gulf of Finland. Silks, woollen stuffs, and all kinds of manufactured wares were brought back in exchange and sold throughout northern Russia.

Nevertheless, the continuous struggle between the "black" and "white" people (the patricians and the plebeians) offered many opportunities to Moscow for interference in the internal affairs of Pskoff, especially with regard to the election of the princes, which was often the occasion of severe conflicts. In 1399 the prince of Moscow arrogated the privilege of confirming the elected prince of Pskoff in his rights; and though, fifty years later, Pskoff and Novgorod concluded several defensive treaties against Moscow the fall of both republics was inevitable, the poorer classes continuing to seek at Moscow a protection against the oppression of the richer citizens. After the fall of Novgorod (1475) Pskoff could no longer maintain its independence, and in 1510 it was taken by Vasilii Joannovitch. The vyetche was abolished and its bell taken away, and a waywode was nominated by Moscow to govern the city. Moscow merchants were settled at Pskoff, and put in possession of the fortunes of the former citizens. The conquered territory still maintained to some extent its self-government, especially with re-

gard to trade, but the struggle between rich and poor was aggravated by the intervention of foreigners. The "lutschiye ludi" (wealthier merchants) prohibited the "malomotchnyie" (poorer merchants) from entering into direct trade relations with foreigners, and compelled them to sell their wares to themselves or to become their agents. These disputes furnished Moscow at the end of the 17th century with a pretext for abolishing the last vestiges of self-government at Pskoff, and for placing all affairs of local administration in the hands of the Moscow waywodes. Thenceforward Pskoff fell into rapid decay. It became a stronghold of Russia against Poland and was besieged for seven months by Stephan Bathory during the Livonian War, and later on by Gustavus Adolphus. Under Peter I. it became a fortified camp, and its walls were protected by earthworks. But it never recovered its former importance, and is now one of the poorer cities of the empire. (P. A. K.)

PSYCHE. See CUPID.

PSYCHOLOGY

The Standpoint of Psychology.

IN the several natural sciences the scope and subject-matter of each are so evident that little preliminary discussion on this score is called for. It is easy to distinguish the facts dealt with in a treatise on light from those that belong to one on sound; and even when the need arises to compare the results of two such sciences—as in the case, say, of light and electricity—there is still no difficulty,—apart, of course, from any which the imperfect state of the sciences themselves may occasion. Theoretically, a standpoint is attainable from which this comparison can be made, in so far, say, as the facts of both sciences can be expressed in terms of matter and motion. But with psychology, however much it is freed from metaphysics, all this is different. It is indeed ordinarily assumed that its subject-matter can be at once defined: "It is what you can perceive by consciousness or reflexion or the internal sense," says one, "just as the subject-matter of optics is what you can perceive by sight." Or, "psychology is the science of the phenomena of mind," we are told again, "and is thus marked off from the physical sciences, which treat only of the phenomena of matter." But, whereas nothing is simpler than to distinguish between seeing and hearing, or between the phenomena of heat and the phenomena of gravitation, a very little reflexion may convince us that we cannot in the same fashion distinguish internal from external sense, or make clear to ourselves what we mean by phenomena of mind as distinct from phenomena of matter.

Internal
and ex-
ternal.

Let us begin with the supposed differentia of internal and external; and first of all what are we to understand by an inner sense? To every sense there corresponds a sense-organ; the several senses are distinct and independent, so that no one sense can add to or alter the materials of another; and each is *sui generis* as regards quality,—the possession of five senses, *e.g.*, furnishing no data as to the character of a possible sixth. Moreover, sense-impressions are passively received and occur in the first instance without regard to the feeling or volition of the recipient and without any manner of relation to the "contents of consciousness" at the moment. Now such a description will apply but very partially to the so-called "internal sense." We can imagine consciousness without self-consciousness, still more without introspection, much as we can imagine sight without taste or smell. But this does not entitle us to speak of self-consciousness as a sense. For we do not by means of it passively receive impressions differing from all previous presentations, as the sensations of colour for one couched differ from all he has experienced before: the new facts consist rather in the recognition of certain relations among pre-existing presentations, *i.e.*, are due to our mental activity and not to a special mode of what has been called our sensitivity. For when we taste we cannot hear that we taste, when we see we cannot smell that we see; but when we taste we may be conscious that we taste, when we hear we may be conscious that we hear. In this way all the objects of the external senses are recognized as having new relations by the miscalled "internal sense." Moreover, the facts so ascertained are never independent of feeling and volition and of the contents of consciousness at the time, as true sensations are. Also if we consult the physiologist we learn that there is no evidence of any organ or "centre" that could be regarded as the "physical

basis" of this inner sense; and, if self-consciousness alone is temporarily in abeyance and a man merely "beside himself," such state of delirium has little analogy to the functional blindness or deafness that constitutes the temporary suspension of sight or hearing.

To the conception of an internal perception or observation the preceding objections do not necessarily apply,—that is to say, this conception may be so defined that they need not. But then in proportion as we escape the charge of assuming a special sense which furnishes the material for such perception or observation, in that same proportion are we compelled to seek for some other mode of distinguishing its subject-matter. For, so far as the mere mental activity of perceiving or observing is concerned, it is not easy to see any essential difference in the process whether what is observed be psychical or physical. It is quite true that the so-called psychological observation is more difficult, because the facts observed are often less definite and less persistent, and admit less of actual isolation than physical facts do; but the process of recognizing similarities or differences, the dangers of mal-observation or non-observation, are not materially altered on that account. It may be further allowed that there is one difficulty peculiarly felt in psychological observation, the one most inaccurately expressed by saying that here the observer and the observed are one. But this difficulty is surely in the first instance due to the very obvious fact that our powers of attention are limited, so that we cannot alter the distribution of attention at any moment without altering the contents of consciousness at that moment. Accordingly, where there are no other ways of surmounting this difficulty, the psychological observer must either trust to representations at a later time, or he must acquire the power of taking momentary glances at the psychological aspects of the phase of consciousness in question. And this one with any aptitude for such studies can do with so slight a diversion of attention as not to disturb very seriously either the given state or that which immediately succeeds it. But very similar difficulties have to be similarly met by physical observers in certain special cases, as, *e.g.*, in observing and registering the phenomena of solar eclipse; and similar aptitudes in the distribution of attention have to be acquired, say, by extempore orators or skilful surgeons. Just as little, then, as there is anything that we can with propriety call an inner sense, just so little can we find in the process of inner perception any satisfactory characteristic of the subject-matter of psychology. The question still is: What is it that is perceived or observed? and the readiest answer of course is: Internal experience as distinguished from external, what takes place in the mind as distinct from what takes place without.

This answer, it must be at once allowed, is adequate for most purposes, and a great deal of excellent psychological work has been done without ever calling it in question. But the distinction between internal and external experience is not one that can be drawn from the standpoint of psychology, at least not at the outset. From this standpoint it appears to be either (1) inaccurate or (2) not extra-psychological. As to (1), the boundary between the internal and the external was, no doubt, originally the surface of the body, with which the subject or self was identified; and in this sense the terms are of course correctly used. For a thing may, in the same sense of the word, be in one space and therefore not in—*i.e.*, out of—another; but we express no intelligible relation if we speak of two things as being one in a given room and the other in last week. Any one is at liberty to say if he choose that a certain thing is "in his mind"; but if in this way he distinguishes it from something else not in his mind, then to be intelligible this must imply one of two statements,—either that the something else is actually or possibly in some other mind, or, his own mind being alone considered, that at the time the something else does not exist at all. Yet, evident as it seems that the correlatives in and not-in must both apply to the same category, whether space,

time, presentation (or non-presentation) to a given subject, and so forth, we still find psychologists more or less consciously confused between "internal," meaning "presented" in the psychological sense, and "external," meaning not "not-presented" but corporeal or oftener extra-corporeal. But (2), when used to distinguish between presentations (some of which, or some relations of which with respect to others, are called "internal," and others or other relations, "external"), these terms are at all events accurate; only then they cease to mark off the psychological from the extra-psychological, inasmuch as psychology has to analyse this distinction and to exhibit the steps by which it has come about. But we have still to examine whether the distinction of phenomena of Matter and phenomena of Mind furnishes a better dividing line than the distinction of internal and external.

Mental
and
material.

A phenomenon, as commonly understood, is what is manifest, sensible, evident, the implication being that there are eyes to see, ears to hear, and so forth,—in other words, that there is presentation to a subject; and wherever there is presentation to a subject it will be allowed that we are in the domain of psychology. But in talking of physical phenomena we, in a way, abstract from this fact of presentation. Though consciousness should cease, the physicist would consider the sum total of objects to remain the same: the orange would still be round, yellow, and fragrant as before. For the physicist—whether aware of it or not—has taken up a position which for the present may be described by saying that phenomenon with him means appearance or manifestation, or—as we had better say—object, not for a concrete individual, but rather for what Kant called *Bewusstsein überhaupt*, or, as some render it, the objective consciousness, i.e., for an imaginary subject freed from all the limitations of actual subjects save that of depending on "sensibility" for the material of experience. However, this is not all, for, as we shall see presently, the psychologist also occupies this position; at least if he does not, his is not a true science. But further, the physicist leaves out of sight altogether the facts of attention, feeling, and so forth, all which actual presentation entails. From the psychological point of view, on the other hand, the removal of the subject removes not only all such facts as attention and feeling, but all presentation or possibility of presentation whatever. Surely, then, to call a certain object, when we abstract from its presentation, a material phenomenon, and to call the actual presentation of this object a mental phenomenon, is a clumsy and confusing way of representing the difference between the two points of view. For the terms "material" and "mental" seem to imply that the two so-called phenomena have nothing in common, whereas the same object is involved in both, while the term "phenomenon" implies that the point of view is in each case the same, when in truth what is emphasized by the one the other ignores.

Stand-
point of
psycho-
logy.

Paradoxical though it may be, we must then conclude that psychology cannot be defined by reference to a special subject-matter as such concrete sciences, for example, as mineralogy and botany can; and, since it deals in some sort with the whole of experience, it is obviously not an abstract science, in any ordinary sense of that term. To be characterized at all, therefore, apart from metaphysical assumptions, it must be characterized by the standpoint from which this experience is viewed. It is by way of expressing this that widely different schools of psychology define it as subjective, all other positive sciences being distinguished as objective. But this seems scarcely more than a first approximation to the truth, and, as we have seen incidentally, is apt to be misleading. The distinction rather is that the standpoint of psychology is what is sometimes termed "individualistic," that of the so-called object-sciences being "universalistic," both alike being objective in the sense of being true for all, consisting of what Kant would call judgments of experience. For psychology is not a biography in any sense, still less a biography dealing with idiosyncrasies, and in an idiom having an interest and a meaning for one subject only, and incommunicable to any other. Locke, Berkeley, and Hume have been of late severely handled because they regarded the critical investigation of knowledge as a psychological problem, and set to work to study the individual mind simply for the sake of this problem. But none the less their standpoint was the proper one for the science of psychology itself; and, however surely their philosophy was foredoomed to a collapse, there is no denying a steady psychological advance as we pass from Locke to Hume and his modern representatives. By "idea" Locke tells us he

means "whatsoever is the object of the understanding when a man thinks" (i.e., is conscious), and having, as it were, shut himself within such a circle of ideas he finds himself powerless to explain his knowledge of a world that is independent of it; but he is able to give a very good account of some of these ideas themselves. He cannot justify his belief in the world of things whence certain of his simple ideas "were conveyed" any more than Robinson Crusoe could have explored the continents whose products were drifted to his desert island, though he might perhaps survey the island itself well enough. Berkeley accordingly, as Professor Fraser happily puts it, abolished Locke's hypothetical outer circle. Thereby he made the psychological standpoint clearer than ever—hence the truth of Hume's remark, that Berkeley's arguments "admit of no answer"; at the same time the epistemological problem was as hopeless as before—hence again the truth of Hume's remark that those arguments "produced no conviction." Of all the facts with which he deals, the psychologist may truly say that their *esse* is *percipi*, inasmuch as all his facts are facts of presentation, are ideas in Locke's sense, or objects which imply a subject. Before we became conscious there was no world for us; should our consciousness cease, the world for us ceases too; had we been born blind, the world would for us have had no colour; if deaf, it would have had no sounds; if idiotic, it would have had no meaning. Psychology, then, never transcends the limits of the individual; even the knowledge that there is a real world, as common-sense assumes, is, when psychologically regarded, an individual's knowledge, which had a beginning and a growth, and can have an end. In fact, for the psychologist it is not essentially knowledge, but presentations, partly possible, partly actual, in the mind of A, B, or C; just as this page is for the printer essentially "copy," and only for the reader essentially "discourse." But what the psychologist has to say about knowledge is, of course, itself knowledge, i.e., assuming it to be correct; the knowledge about which he knows is, however, for him not primarily knowledge, but "states of consciousness."

But now, though this Berkeleyan standpoint is the standpoint of psychology—as we find it occupied, say, by J. S. Mill and Dr Bain—psychology is not pledged to the method employed by Berkeley and by Locke. Psychology may be individualistic without being confined exclusively to the introspective method. There is nothing to hinder the psychologist from employing materials furnished by his observations of other men, of infants, of the lower animals, or of the insane; nothing to hinder him taking counsel with the philologist or even the physiologist, provided always he can show the psychological bearings of those facts which are not directly psychological. Nor, again, are we bound, because we take the individualistic standpoint as psychologists, to accept the philosophical conclusions that have been reached from it, unless, indeed, we hold that it is the right point of view for philosophical speculation. A psychologist *may* be an idealist in Berkeley's sense or in Fichte's, but he need not; he is just as free, if he see reason, to call himself, after Hamilton, a natural realist; only psychology will afford him no safe warrant for the realism part of it. The standpoint of psychology, then, is individualistic; by whatever methods, from whatever sources its facts are ascertained, they must—to have a psychological import—be regarded as having place in, or as being part of, *some one's consciousness*. In this sense, i.e., as presented to an individual, "the whole choir of heaven and furniture of earth" may belong to psychology, but otherwise they are psychological nonentities. The problem of psychology, in dealing with this complex subject-matter, is in general—first, to ascertain its constituent

elements, and secondly, to ascertain and explain the laws of their combination and interaction.

General Analysis of Mind; its Ultimate Constituents.

Constituent elements of mind.

As to the first, there is in the main substantial agreement: the elementary facts of mind cannot, it is held, be expressed in less than three propositions,—I feel somehow, I know something, I do something. But here at once there arises an important question, viz., What are we to understand by the subject of these propositions? Nobody nowadays would understand it to imply that every psychological fact must be ascertained or verified by personal introspection; perhaps no modern writer ever did understand this; at any rate to do so is to confound the personal with the psychological. We are no more confined to our own immediate observations here than elsewhere; but the point is that, whether seeking to analyse one's own consciousness or to infer that of a lobster, whether discussing the association of ideas or the expression of emotions, there is always an individual mind or self or subject in question. It is not enough to talk of feelings or volitions: what we mean is that some individual, man or worm, feels, wills, acts—thus or thus. Obvious as this may seem, it has been frequently either forgotten or gainsaid. It has been forgotten among details or through the assumption of a medley of faculties, each treated as an individual in turn, and among which the real individual was lost. Or it has been gainsaid, because to admit that all psychological facts pertain to a psychological subject seemed to carry with it the admission that they pertained to a particular spiritual substance, which was simple, indestructible, and so forth; and it was manifestly desirable to exclude such assumptions from psychology, i.e., from a science which aims only at a scientific exposition of what can be known and verified by observation. But, however much assailed or disowned, the conception of a mind or conscious subject is to be found implicitly or explicitly in all psychological writers whatever,—not more in Berkeley, who accepts it as a fact, than in Hume, who accepts it as a fiction. This being so, we are far more likely to reach the truth eventually if we openly acknowledge this inextinguishable assumption, if such it prove, instead of resorting to all sorts of devious periphrases to hide it. Now wherever the word *Subject*, or its derivatives, occurs in psychology we might substitute the word *Ego* and analogous derivatives, did such exist. But *Subject* is almost always the preferable term; its impersonal form is an advantage, and it readily recalls its modern correlative *Object*. Moreover, *Ego* has two senses, distinguished by Kant as pure and empirical, the latter of which is, of course, an object, while the former is subject always. By pure *Ego* or *Subject* it is proposed to denote the simple fact that everything mental is referred to a Self. This psychological conception of a self or subject, then, is after all by no means identical with the metaphysical conceptions of a soul or mind-atom, or of mind-stuff not atomic; it may be kept as free from metaphysical implications as the conception of the biological individual or organism with which it is so intimately connected.

Attempts to extrude the Ego.

The attempt, indeed, has frequently been made to resolve the former into the latter, and so to find in mind only such an individuality as has an obvious counterpart in this individuality of the organism, i.e., what we may call an objective individuality. But such procedure owes all its plausibility to the fact that it leaves out of sight the difference between the biological and the psychological standpoints. All that the biologist means by a dog is "the sum of the phenomena which make up its corporeal existence."¹ And, inasmuch as its presentation to any one in particular is a point of no importance, the fact of presentation at all may be very well dropped out of account. Let us now turn to mind: Why should we not take this word or "the word 'soul' simply as a name for the series of mental phenomena which make up an indi-

vidual mind?"² Surely the moment we try distinctly to understand this question we realize that the cases are different. "Series of mental phenomena" for whom? For any passer-by such as might take stock of our biological dog? No, obviously only for that individual mind itself; yet that is supposed to be made up of, to be nothing different from, the series of phenomena. Are we, then, (1) quoting J. S. Mill's words, "to accept the paradox that something which *ex hypothesi* is but a series of feelings, can be aware of itself as a series?"³ Or (2) shall we say that the several parts of the series are mutually phenomenal, much as A may look at B, who was just now looking at A? Or (3) finally, shall we say that a large part of the so-called series, in fact every term but one, is phenomenal for the rest—for that one?

As to the first alternative, paradox is too mild a word for it; even contradiction will hardly suffice. It is as impossible to express "being aware of" by one term as it is to express an equation or any other relation by one term: what knows can no more be identical with what is known than a weight with what it weighs. If a series of feelings is what is known or presented, then what knows, what it is presented to, cannot be that series of feelings, and this without regard to the point Mill mentions, viz., that the infinitely greater part of the series is either past or future. The question is not in the first instance one of time or substance at all, but simply turns upon the fact that knowledge or consciousness is unmeaning except as it implies something knowing or conscious of something. But it may be replied:—Granted that the formula for consciousness is something doing something, to put it generally; still, if the two somethings are the same when I touch myself or when I see myself, why may not agent and patient be the same when the action is knowing or being aware of; why may I not know myself—in fact, do I not know myself? Certainly not; agent and patient never are the same in the same act; the conceptions of self-caused, self-moved, self-known, *et id genus omne*, either connote the incomprehensible or are abbreviated expressions—such, e.g., as touching oneself when one's right hand touched one's left.

And so we come to the second alternative:—As one hand washes the other, may not different members of the series of feelings be subject and object in turn? Compare, for example, the state of mind of a man succumbing to temptation (as he pictures himself enjoying the coveted good and impatiently repudiates scruples of conscience or dictates of prudence) with his state when, filled with remorse, he sides with conscience and condemns this "former self,"—the "better self" having meanwhile become supreme. Here the cluster of presentations and their associated sentiments and motives, which together play the rôle of self in the one field of consciousness, have—only momentarily it is true, but still have—for a time the place of not-self; and under abnormal circumstances this partial alternation may become complete alienation, as in what is called "double consciousness." Or again, the development of self-consciousness might be loosely described as taking the subject or self of one stage as an object in the next,—self being, e.g., first identified with the body and afterwards distinguished from it. But all this, however true, is beside the mark; and it is really a very serious misnomer,—though the vagueness of our psychological terminology seems to allow it—to do, as e.g., Mr Spencer does—represent the development of self-consciousness as a "differentiation of subject and object." It is, if anything, a differentiation of object and object, i.e., in plainer words, it is a differentiation among presentations—a differentiation every step of which implies just that relation to a subject which it is supposed to supersede.

There still remains an alternative, which, like the first, may be expressed in the words of J. S. Mill, viz., "the alternative of believing that the Mind or Ego is something different from any series of feelings or possibilities of them." To admit this, of course, is to admit the necessity of distinguishing between Mind or Ego, meaning the unity or continuity of consciousness as a complex of presentations, and Mind or Ego as the subject to which this complex is presented. In dealing with the body from the ordinary biological standpoint no such necessity arises. But, whereas there the individual organism is spoken of unequivocally, in psychology, on the other hand, the individual mind may mean either (i.) the series of feelings or "mental phenomena" above referred to; or (ii.) the subject of these feelings for whom they are phenomena; or (iii.) the subject of these feelings or phenomena + the series of feelings or phenomena themselves, the two being in that relation to each other in which alone the one is subject and the other a series of feelings, phenomena, or objects. It is in this last sense that Mind is used in empirical psychology, its exclusive use in the first sense being favoured only by those who shrink from the speculative associations connected with its exclusive use in the second. But psychology is not called upon to transcend the relation of subject to object or, as we may call it, the fact of presentation. On the other hand, as has been said, the attempt to ignore one term of the relation is hopeless; and equally hopeless, even futile, is the

¹ Professor Huxley, *Hume* (English Men of Letters series), p. 171.

² Professor Huxley, *op. cit.*, p. 172.

³ *Examination of Sir W. Hamilton's Philosophy*, ch. xii. fn.

attempt, by means of phrases such as consciousness or the unity of consciousness, to dispense with the recognition of a conscious subject.

Feeling.

We might now proceed to inquire more closely into the character and relations of the three states, modes, or acts¹ of this subject, which are commonly held to be the invariable constituents of psychical life and broadly distinguished as cognitions, feelings, and conations. But we should be at once confronted by a doctrine much in vogue at present, which, strictly taken, amounts almost to a denial of this tripartite classification of the facts of mind—the doctrine, viz., that *feeling* alone is primordial, and invariably present wherever there is consciousness at all. Every living creature, it is said, feels, though it may never do any more; only the higher animals, and these only after a time, learn to discriminate and identify and to act with a purpose. This doctrine, as might be expected, derives its plausibility partly from the vagueness of psychological terminology, and partly from the intimate connexion that undoubtedly exists between feeling and cognition on the one hand and feeling and volition on the other. As to the meaning of the term, it is plain that further definition is requisite for a word that may mean (a) a touch, as feeling of roughness; (b) an organic sensation, as feeling of hunger; (c) an emotion, as feeling of anger; (d) feeling proper, as pleasure or pain. But, even taking feeling in the last, its strict sense, it has been maintained that all the more complex forms of consciousness are resolvable into, or at least have been developed from, feelings of pleasure and pain. The only proof of such position, since we cannot directly observe the beginnings of conscious life, must consist of considerations such as the following. So far as we can judge, we find feeling everywhere; but, as we work downwards from higher to lower forms of life, the possible variety and the definiteness of sense-impressions both steadily diminish. Moreover, we can directly observe in our own organic sensations, which seem to come nearest to the whole content of infantile and molluscos experience, an almost entire absence of any assignable *qualé*. Finally, in our sense-experience generally, we find the element of feeling at a maximum in the lower senses and the intellectual element at a maximum in the higher. But the so-called intellectual senses are the most used, and use we know blunts feeling and favours intellection, as we see in chemists, who sort the most filthy mixtures by smell and taste without discomfort. If, then, feeling predominates more and more as we approach the beginning of consciousness, may we not say that it is the only *sine qua non* of consciousness? Considerations of this kind, however impressive when exhibited at length, are always liable to be overturned by some apparently unimportant fact which may easily be overlooked. Two lines, e.g., may get nearer and nearer and yet will never meet, if the rate of approach is simply proportional to the distance. A triangle may be diminished indefinitely and yet we cannot infer that it becomes eventually all angles, though the angles get no less and the sides do. Now, before we decide that pleasure or pain alone may constitute a complete state of mind, it may be well to inquire: What is the connexion between feelings of pleasure and pain and the two remaining possible constituents of consciousness, as we can observe them now? And this is an inquiry which will help us towards an answer to our main question, namely, that concerning the nature and connexions of what are commonly regarded as the three ultimate facts of mind.

Relation of feeling directly observe, what we find is (1) that we are aware of a certain change in our sensations, thoughts, or circum-

¹ It is useless at this point attempting to decide on the comparative appropriateness of these and similar terms, such as "faculties," "capacities," "functions," &c.

stances, (2) that we are pleased or pained with the change, and (3) that we act accordingly. We never find that feeling directly alters—i.e., without the intervention of the action to which it prompts—either our sensations or situation, but that regularly these latter with remarkable promptness and certainty alter it. We have not first a change of feeling, and then a change in our sensations, perceptions, and ideas; but, these changing, change of feeling follows. In short, feeling appears frequently to be an effect, which therefore cannot exist without its cause, though in different circumstances the same cause may produce a different amount or even a different state of feeling. Turning from what we may call the receptive phase of consciousness to the active or appetitive phase, we find in like manner that feeling is certainly not, in such cases as we can clearly observe, the whole of consciousness at any moment. True, in common speech we talk of liking pleasure and disliking pain; but this is either tautology, equivalent to saying, we are pleased when we are pleased and pained when we are pained, or else it is an allowable abbreviation, and means that we like pleasurable *objects* and dislike painful *objects*, as when we say, we like feeling warm and dislike feeling hungry. And feeling warm or feeling hungry, we must remember, is not pure feeling in the strict sense of the word. Such states admit, if not of description, yet at least of identification and distinction as truly as colours and sounds do. Within the limits of our observation, then, we find that feeling accompanies some more or less definite presentation which for the sake of it becomes the object of appetite or aversion; in other words, feeling implies a relation to a pleasurable or painful presentation, that, as cause of feeling and end of the action to which feeling prompts, is doubly distinguished from it. Thus the very facts that lead us to distinguish feeling from cognition and conation make against the hypothesis that consciousness can ever be all feeling.

But, as already said, the plausibility of this hypothesis is in good part due to a laxity in the use of terms. Most and psychologists before Kant, and English psychologists even to the present day, speak of pleasure and pain as sensations. But it is plain that pleasure and pain are not simple ideas, as Locke called them, in the sense in which touches and tastes are,—that is to say, they are never like these localized or projected, nor elaborated in conjunction with other sensations and movements into percepts or intuitions of the external. This confusion of feeling with sensations is largely consequent on the use of one word pain for certain organic sensations and for the purely subjective state. But, to say nothing of the fact that such pains are always more or less definitely localized,—which of itself is so far cognition,—they are also distinguished as shooting, burning, gnawing, &c. &c., all which symptoms indicate a certain objective quality. Accordingly all the more recent psychologists have been driven by one means or another to recognize two "aspects" (Bain), or "properties" (Wundt), in what they call a sensation, the one a "sensible or intellectual," or "qualitative," the other an "affective" or "emotive," aspect or property. The term "aspect" is figurative and obviously inaccurate; even to describe pleasure and pain as properties of sensation is a matter open to much question. But the point which at present concerns us is simply that when feeling is said to be the primordial element in consciousness more is usually included under feeling than pure pleasure and pain, viz., some characteristic or quality by which one pleasurable or painful sensation is distinguishable from another. No doubt, as we go downwards in the chain of life the qualitative or objective elements in the so-called sensations become less and less definite; and at the same time organisms with well-developed sense-organs give place to others

without any clearly differentiated organs at all. But there is no ground for supposing even the amœba itself to be affected in all respects the same whether by changes of temperature or of pressure or by changes in its internal fluids, albeit all of these changes will further or hinder its life and so presumably be in some sort pleasurable or painful. On the whole, then, there are grounds for saying that the endeavour to represent all the various facts of consciousness as evolved out of feeling is due to a hasty striving after simplicity, and has been favoured by the ambiguity of the term feeling itself. If by feeling we mean a certain subjective state varying continuously in intensity and passing from time to time from its positive phase (pleasure) to its negative phase (pain), then this purely pathic state implies an agreeing or disagreeing something which psychologically determines it. If, on the other hand, we let feeling stand for both this state and the cause of it, then, perhaps, a succession of such "feelings" may make up a consciousness; but then we are including two of our elementary facts under the name of one of them. *The simplest form of psychical life, therefore, involves not only a subject feeling but a subject having qualitatively distinguishable presentations which are the occasion of its feeling.*

Presentation.

We may now try to ascertain what is meant by cognition as an essential element in this life, or, more exactly, what we are to understand by the term *presentation*. It was an important step onwards for psychology when Locke introduced that "new way of ideas" which Stillingfleet found alternately so amusing and so dangerous. By idea Locke tells us he meant true appearances in men's minds, or "whatsoever is the immediate object of perception, thought, or understanding"; and it was so far a retrograde step when Hume restricted the term to certain only of these appearances or objects, or rather to these appearances or objects in a certain state, viz., as reproduced ideas or images. And, indeed, the history of psychology seems to show that its most important advances have been made by those who have kept closely to this way of ideas; the establishment of the laws of association and their many fruitful applications and the whole Herbartian psychology may suffice as instances (see HERBART). The truth is that the use of such a term is itself a mark of an important generalization, one which helps to free us from the mythology and verbiage of the "faculty-psychologists." All that variety of mental facts which we speak of as sensations, perceptions, images, intuitions, concepts, notions, have two characteristics in common:—(1) they admit of being more or less attended to, and (2) can be reproduced and associated together. It is here proposed to use the term presentation to connote such a mental fact, and as the best English equivalent for what Locke meant by idea and what Kant and Herbart called a *Vorstellung*.

A presentation has then a twofold relation,—first, directly to the subject, and secondly, to other presentations. By the first is meant the fact that the presentation is attended to, that the subject is more or less conscious of it: it is "in his mind" or presented. As presented to a subject a presentation might with advantage be called an object, or perhaps a psychical object, to distinguish it from what are called objects apart from presentation, i.e., conceived as independent of any particular subject. Locke, as we have seen, did so call it; still, to avoid possible confusion, it may turn out best to dispense with the frequent use of object in this sense. But on one account, at least, it is desirable not to lose sight altogether of this which is after all the stricter as well as the older signification of object, namely, because it enables us to express definitely, without implicating any ontological theory, what we have so far seen reason to think is the fundamental fact in psychology. Instead of depending mainly on that vague

and treacherous word "consciousness," or committing ourselves to the position that ideas are modifications of a certain mental substance and identical with the subject to which they are presented, we may leave all this on one side, and say that ideas are objects, and the relation of objects to subjects—that whereby the one is object and the other subject—is presentation. And it is because only objects sustain this relation that they may be spoken of simply as presentations.

It will be convenient here to digress for a moment to take account of an objection that is sure to be urged, viz., that sensations at all times ought not to be called objects, that they are "states of the psychical subject" and that this is a deliverance of common sense, if anything logical is. Now if by this be meant (i.) that sensations are *metaphysically* subjective modifications in an idealistic sense, there is no need at this stage either to assert or deny that. But if the meaning be (ii.) that sensations are *presented* as modes of the subject, such a position is due to a confusion between the subject proper or pure *Ego* and that complex presentation or object, the empirical, or as we might call it the biotic, *Ego*. A self-conscious subject may not only have a sensation but may recognize it as its own,—recognize a certain connexion, that is to say, between the sensation and that presentation of the empirical self which self-consciousness implies. But such reference only renders more obvious the objective nature of a sensation, in the psychological sense of the term objective. Or, again, the meaning may be (iii.) that a subject whose presentations were all sensations would know nothing of the difference between subject and object. In this objection there is a lurking confusion between the standpoint of a given experience and the standpoint of its exposition. The true way, surely, to represent the bare fact of sensation is not to attempt to reproduce an experience as yet confined to sensations, but to describe such experience as a scientific psychologist would do if we could imagine him a spectator of it. The infant who is delighted by a bright colour does not of course conceive himself as face to face with an object; but neither does he conceive the colour as a subjective affection. We are bound to describe his state of mind truthfully, but that is no reason for abandoning terms which have no counterpart in his consciousness, when these terms are only used to depict that consciousness to us. As to the objection (iv.) that, when all is said and done, sensations are *conceived* by common sense as modifications of self, whether so presented or not, it may be granted that it appears so at first blush, but not when common sense is more closely examined. The fact is we are here upon what has been called "the margin of psychology," where our ordinary thinking brings into one view what science has to be at great pains to keep distinct. Though it is scientifically a long way round from a fact of mind to the corresponding fact of body, yet it is only on careful reflexion that we can distinguish the two in those cases in which our practical interests have closely associated them. Such a case is that of sensation. The ordinary conception of a sensation coincides, no doubt, with the definition given by Hamilton and Mansel:—"Sensation proper is the consciousness of certain affections of our body as an animated organism"; and it is because in ordinary thinking we reckon the body as part of self that we come to think of sensations as subjective modifications. But, when considerations of method compel us to eliminate physiological implications from the ordinary conception of a sensation, we are able here to distinguish the conscious subject and the "affections" of which it is conscious as clearly as we can distinguish subject and object in other cases of presentation. On the whole, then, we may conclude that there is nothing either in the facts or in our necessary conceptions of them to prevent us from representing whatever admits of psychical reproduction and association, no matter how simple it be, as an object presented to a subject.

As to the subjective relation of objects, the relation of Attention itself, we have merely to note that on the side of the subject it implies what, for want of a better word, may be called *attention*, extending the denotation of this term so as to include even what we ordinarily call inattention. Attention so used will thus cover part of what is meant by consciousness,—so much of it, that is, as answers to being mentally active, active enough at least to "receive impressions." Attention on the side of the subject implies intensity on the side of the object: we might indeed almost call intensity the matter of a presentation, without which it is a nonentity.¹ As to the connexion between these two, subjective attention and

¹ Compare Kant's Principle of the Anticipations of Perception:—"In all phenomena the real which is the object of sensation has intensive magnitude."

objective intensity—in that higher form of attention called voluntary we are aware (1) that concentration of attention increases or its abstraction diminishes the intensity of a presentation in circumstances where physically and physiologically there is nothing to prevent the intensity of the presentation from continuing uniform. Again, (2) in circumstances when psychologically we are aware of no previous change in the distribution of attention, we find the intensity of a presentation increased or diminished if certain physical concomitants of the presentation (*e.g.*, stimulus, nervous process, &c.) are increased or diminished. Thus, though this is a point we could hardly establish without the aid of psychophysics, we may conclude that the intensity of a presentation may be altered from two sides; that it depends, in other words, partly upon what we may perhaps call its physical intensity and partly on the amount of attention it receives.

Some further exposition of the connexion between subjective attention and objective intensity is perhaps desirable here, where we are seeking to get a general view of the essential facts of mind and their relations, rather than later on, when we shall be more concerned with details. We are aware in ordinary life that the intensity of any given sensation depends upon certain physical quantities, varying directly in some proportion as these vary. Hence, since our habitual standpoint is the physical not the psychological, we conceive sensory objects as having an intensity *per se* apart from the attention that their presentation secures. From the physical standpoint indeed it is manifest that no other conception is compatible with a scientific treatment of phenomena. Subjective sources of variation are supposed to be eliminated: the general mind to which, according to the physicist's conception of a phenomenon, that phenomenon is implicitly supposed to be presented is a mind in which there is no feeling to produce variations of attention, or to favour æsthetic combinations of objects. Attention is thus assumed to be constant, and all variations in intensity to be objectively determined. But psychologically we cannot assume this. In any given presentation there is, it must be admitted, no immediate evidence that the intensity of the object is a function of two variables,—(1) what we have called its physical or absolute intensity and (2) the intensity of attention. Still there are facts which justify this conclusion. That the intensity of the presentation varies with the absolute intensity of the object, attention remaining constant, is a proposition not likely to be challenged. What has to be shown is that the intensity of presentations varies with the attention, all else remaining constant. Assuming that voluntary and non-voluntary attention are fundamentally the same, this amounts to showing (1) that concentration of attention upon some objects diminishes the intensity of presentation of others in the same field, whether the concentration be voluntary or non-voluntary, *i.e.*, due to a shock; and (2) that, even though only within narrow limits, increasing attention voluntarily has the same effect on the presentation as increasing the objective intensity from the physical side. The narrowness of these limits—practically an all-important fact—is theoretically no objection. It would not be difficult psychologically to account for our inability to concentrate attention indefinitely: that we can concentrate it at all is enough to show that there is a subjective as well as an objective factor in the intensity of a presentation. Any fuller consideration of the connexion between attention and presentations may be deferred.

Con-
tinuity
of con-
scious-
ness.

The inter-objective relations of presentations, on which their second characteristic, that of revivability and associability depends, though of the first importance in themselves, hardly call for examination in a general analysis like the present. But there is one point still more fundamental that we cannot wholly pass by: it is—in part at any rate—what is commonly termed the unity or continuity of consciousness. From the physical standpoint and in ordinary life we can talk of objects that are isolated and independent and in all respects distinct individuals. The screech of the owl, for example, has physically nothing to do with the brightness of the moon: either may come or go without changing the order of things to which the other belongs. But psychologically, for the individual percipient, they are parts of one whole: special attention to one diminishes the intensity of presentation of the other and the recurrence of the one will afterwards entail the re-presentation of the other also. Not only are they still parts of one whole, but such distinctness as they have

at present is the result of a gradual differentiation. It is quite impossible for us now to imagine the effects of years of experience removed, or to picture the character of our infantile presentations before our interests had led us habitually to concentrate attention on some, and to ignore others, whose intensity thus diminished as that of the former increased. In place of the many things which we can now see and hear, not merely would there then be a confused presentation of the whole field of vision and of a mass of undistinguished sounds, but even the difference between sights and sounds themselves would be without its present distinctness. Thus the further we go back the nearer we approach to a total presentation having the character of one general *continuum* in which differences are latent. There is, then, in psychology, as in biology, what may be called a principle of “progressive differentiation or specialization”; and this, as well as the facts of reproduction and association, forcibly suggests the conception of a certain objective continuum forming the background or basis to the several relatively distinct presentations that are elaborated out of it—the equivalent, in fact, of that unity and continuity of consciousness which has been supposed to supersede the need for a conscious subject.

There is one class of objects of special interest even in Motor a general survey, viz., movements or motor presentations. These, like sensory presentations, admit of association and reproduction, and seem to attain to such distinctness as they possess in adult human experience by a gradual differentiation out of an original diffused mobility which is little besides emotional expression. Of this, however, more presently. It is primarily to such dependence upon feeling that movements owe their distinctive character, the possession, that is, under normal circumstances, of definite and assignable psychical antecedents, in contrast to sensory presentations, which enter the field of consciousness *ex abrupto*. We cannot psychologically explain the order in which particular sights and sounds occur; but the movements that follow them, on the other hand, can be adequately explained only by psychology. The twilight that sends the hens to roost sets the fox to prowl, and the lion's roar which gathers the jackals scatters the sheep. Such Subject- diversity in the movements, although the sensory presentations are similar, is due, in fact, to what we might call the principle of “subjective or hedonic selection”—that, out of all the manifold changes of sensory presentation which a given individual experiences, only a few are the occasion of such decided feeling as to become objects of possible appetite (or aversion). The representation of what interests us comes to be associated with the representation of such movements as will secure its realization, so that—although no concentration of attention will secure the requisite intensity to a pleasurable object present only in idea—we can by what is strangely like a concentration of attention convert the idea of a movement into the fact, and by means of the movement attain the coveted reality.

And this has brought us round naturally to what is perhaps the easiest way of approaching the question: What is a *conation* or *action*? In ordinary voluntary movement we have first of all an idea or re-presentation of the movement, and last of all the actual movement itself,—a new presentation which may for the present be described as the filling out of the re-presentation,¹ which thereby attains that intensity, distinctness, and embodiment we call reality. How does this change come about? The attempt has often been made to explain it by a reference to the more uniform, and apparently simpler, case of reflex

¹ On the connexion of presentations and re-presentations, see p. 59, below.

action, including under this term what are called sensori-motor and ideo-motor actions. In all these the movement seems to be the result of a mere transference of intensity from the associated sensation or idea that sets on the movement. But, when by some chance or mischance the same sensory presentation excites two alternative and conflicting motor ideas, a temporary block, it is said, occurs; and, when at length one of these nascent motor changes finally prevails and becomes real, then we have the state of mind called volition.¹ But this assumption that sensory and motor ideas are associated before volition, and that the volition begins where automatic or reflex action ends, is due to that inveterate habit of confounding the psychical and the physical which is the bane of modern psychology. How did these particular sensory and motor presentations ever come to be associated? It is wholly beside the mark to answer that they are "*organically determined* psychical changes." In one respect all psychical changes alike are organically determined, inasmuch as all alike—so far, at least, as we at all know or surmise—have organic concomitants. In another respect no psychical changes are organically determined, inasmuch as physical events and psychical events have no common factors. Now the only psychological evidence we have of any very intimate connexion between sensory and motor representations is that furnished by our acquired dexterities, *i.e.*, by such movements as Hartley styled secondary automatic. But then all these have been preceded by volition: as Mr Spencer says, "the child learning to walk wills each movement before walking it." Surely, then, a psychologist should take this as his typical case and prefer to assume that all automatic actions that come within his ken at all are in this sense secondarily automatic, *i.e.*, to say that either in the experience of the individual or of his ancestors volition, or something analogous to it, preceded habit.

But, if we are thus compelled by a sound method to regard sensori-motor actions as degraded or mechanical forms of voluntary actions, instead of regarding voluntary actions as gradually differentiated out of something physical, we have not to ask: What happens when one of two alternative movements is executed? but the more general question: What happens when any movement is made in consequence of feeling? It is obvious that on this view the simplest *definitely purposive* movement must have been preceded by some movement simpler still. For any distinct movement purposely made presupposes the ideal presentation, before the actual realization, of the movement. But such ideal presentation, being a re-presentation, equally presupposes a previous actual movement of which it is the so-called mental residuum. There is then, it would seem, but one way left, *viz.*, to regard those movements which are immediately expressive of pleasure or pain as primordial, and to regard the so-called voluntary movements as elaborated out of these. The vague and diffusive character of these primitive emotional manifestations is really a point in favour of this position. For such "diffusion" is evidence of an underlying continuity of motor presentations parallel to that already discussed in connexion with sensory presentations, a continuity which, in each case, becomes differentiated in the course of experience into comparatively distinct and discrete movements and sensations respectively.²

¹ Compare Spencer's *Principles of Psychology*, i. 496.

² It may be well to call to mind here that Dr Bain also has regarded emotional expression as a possible commencement of action, but only to reject it in favour of his own peculiar doctrine of "spontaneity," which, however, is open to the objection that it makes movement precede feeling instead of following it—an objection that would be serious even if the arguments advanced to support his hypothesis were as cogent as only Dr Bain takes them to be. Against the position

But, whereas we can only infer, and that in a very roundabout fashion, that our sensations are not absolutely distinct but are parts of one massive sensation, as it were, we are still liable under the influence of strong emotion directly to experience the corresponding continuity in the case of movement. Such motor-continuum we may suppose is the psychical counterpart of that permanent readiness to act, or rather that continual nascent acting, which among the older physiologists was spoken of as "tonic action"; and as this is now known to be intimately dependent on afferent excitations so is our motor consciousness on our sensory. Still, since we cannot imagine the beginning of life but only life begun, the simplest picture we can form of a concrete state of mind is not one in which there are movements before there are any sensations or sensations before there are any movements, but one in which change of sensation is followed by change of movement, the link between the two being a change of feeling.

Having thus simplified the question, we may now ask again: How is this change of movement through feeling brought about? The answer, as already hinted, appears to be: By a change of attention. We learn from such observations as psychologists describe under the head of fascination, imitation, hypnotism, &c., that the mere concentration of attention upon a movement is often enough to bring the movement to pass. But, of course, in such cases there is neither emotional experience nor volition in question; such facts are only cited to show the connexion between attention and movements. Everybody too has often observed how the execution of any but mechanical movements arrests attention to thoughts or sensations, and *vice versa*. Let us suppose, then, that we have at any given moment a certain distribution of attention between sensory and motor presentations; a change in that distribution means a change in the intensity of some or all of these, and change of intensity in motor presentations means change of movement. Such changes are, however, quite minimal in amount so long as the given presentations are not conspicuously agreeable or disagreeable. As soon as they are, we find pleasure to lead at once to concentration of attention on the pleasurable object; so that pleasure is not at all so certainly followed by movement as we find pain to be, save of course when movements are themselves the pleasurable objects and are executed, as we say, for their own sakes. In fact, pleasure would seem rather to repress movement, except so far as it is coincident either with a more economic distribution, or with a positive augmentation, of the available attention; and either of these, on the view supposed, would lead to increased but indefinite (*i.e.*, playful) movement. Pain, on the other hand, is much more closely connected with movement, and movement too which for obvious reasons much sooner acquires a purposive character. Instead of voluntary concentration of attention upon a painful presentation we find attention to such an object always involuntary; in other words, attention is, as it were, excentrated, dispersed, or withdrawn. If, therefore, the painful presentation is a movement, it is suspended; if it is a sensation, movements are set up which further distract attention, and some of which may effect the removal of the physical source of the sensation.

maintained above he objects that "the emotional wave almost invariably affects a whole group of movements," and therefore does not furnish the "isolated promptings that are desiderated in the case of the will" (*Mental and Moral Science*, p. 323). But to make this objection is to let heredity count for nothing. In fact, wherever a variety of isolated movements is physically possible, there also we always find corresponding instincts, "that untaught ability to perform actions," to use Dr Bain's own language, which a minimum of practice suffices to perfect.

Prim-
ordial
facts of
mind.

We are now at the end of our analysis, and the results may perhaps be most conveniently summarized by first throwing them into a tabular form and then appending a few remarks by way of indicating the main purport of the table. Taking no account of the specific difference between one concrete state of mind and another, and supposing that we are dealing with presentations in their simplest form, *i.e.*, as sensations and movements, we have:—

A SUBJECT	(1) non-voluntarily attending to changes in the sensory-continuum ¹ ; [Cognition]	} = Presentation of sensory	OBJECTS.
	(2) being, in consequence, either pleased or pained; [Feeling]		
	and (3) by voluntary attention or "inner-vation" producing changes in the motor-continuum. ¹ [Conation]		

Of the three phases, thus logically distinguishable, the first and the third correspond in the main with the receptive and active states or powers of the older psychologists. The second phase, being more difficult to isolate, was long overlooked; or, at all events, its essential characteristics were not distinctly marked: it was either confounded with (1), which is its cause, or with (3), its effect. But perhaps the most important of all psychological distinctions is that which traverses both the old bipartite and the prevailing tripartite classification, *viz.*, that between the subject, on the one hand, as acting and feeling, and the objects of this activity on the other. Such distinction lurks indeed under such terms as faculty, power, consciousness, but they tend to keep it out of sight. With this distinction clearly before us—instead of crediting the subject with an indefinite number of faculties or capacities, we must seek to explain not only reproduction, association, agreement, difference, &c., but all varieties of thinking and acting by the laws pertaining to ideas or presentations, leaving to the subject only the one power of variously distributing that attention upon which the intensity of a presentation in part depends. Of this single subjective activity what we call activity in the narrower sense (as, *e.g.*, purposive movement and intellection) is but a special case, although a very important one.

According to this view, then, *presentations, attention, feeling*, are not to be regarded as three co-ordinate genera, each a distinguishable "state of mind or consciousness," *i.e.*, as being all alike included under this one supreme category. There is, as Berkeley long ago urged, no resemblance between activity and an idea; nor is it easy to see anything common to pure feeling and an idea, unless it be that both possess intensity. Classification seems, in fact, to be here out of place. Instead, therefore, of the one *summum genus*, state of mind or consciousness, with its three co-ordinate subdivisions—cognition, emotion, conation—our analysis seems to lead us to recognize three distinct and irreducible facts—attention, feeling, and objects or presentations—as together, in a certain connexion, constituting one concrete state of mind or *psychosis*. Of such concrete states of mind we may then say there are two forms, more or less distinct, corresponding to the two ways in which attention may be determined and the two classes of objects attended to in each, *viz.*, (1) the *sensory* or *receptive state*, when attention is non-voluntarily determined, *i.e.*, where feeling follows the act of attention; and

¹ To cover more complex cases, we might here add the words "or trains of ideas."

(2) the *motor* or *active state*, where feeling precedes the act of attention, which is thus determined voluntarily.

To say that feeling and attention are not presentations will seem to many an extravagant paradox. If all knowledge consists of presentations, it will be said, how come we to know anything of feeling and attention if they are not presented? We know of them indirectly through their effects, not directly in themselves. This is, perhaps, but a more concrete statement of what philosophers have very widely acknowledged in a more abstract form since the days of Kant²—the impossibility of the subjective *qua* subjective being presented. It is in the main clearly put in the following passage from Hamilton, who, however, has not had the strength of his convictions in all cases:—"The peculiarity of feeling, therefore, is that there is nothing but what is subjectively subjective; there is no object different from self,—no objectification of any mode of self. We are, indeed, able to constitute our states of pain and pleasure into objects of reflexion, but, in so far as they are objects of reflexion, they are not feelings but only reflex cognitions of feelings."³ But this last sentence is not, perhaps, altogether satisfactory. The meaning seems to be that feeling "can only be studied through its reminiscence," which is what Hamilton has said elsewhere of the "phenomena of consciousness" generally. But this is a position hard to reconcile with the other, *viz.*, that feeling and cognition are generically distinct. How can that which was not originally a cognition become such by being reproduced? The statements that feeling is "subjectively subjective," that in it "there is no object different from self," are surely tantamount to saying that it is not presented; and what is not presented cannot, of course, be re-presented. Instead, therefore, of the position that feeling and attention are known by being made objects of reflexion, it would seem we can only maintain that we know of them by their effects, by the changes, *i.e.*, which they produce in the character and succession of our presentations.⁴ We ought also to bear in mind that the effects of attention and feeling cannot be known without attention and feeling: to whatever stage we advance, therefore, we have always in any given "state of mind" attention and feeling on the one side, and on the other a presentation of objects. Attention and feeling seem thus to be ever present, and not to admit of the continuous differentiation into parts which gives to presentations a certain individuality, and makes their association and reproduction possible.

Theory of Presentations.

Having now ascertained what seem to be the essential elements in any state of mind, we may next proceed to examine these several elements separately in more detail. It will be best to begin with that which is both the clearest in itself and helps us the most to understand the rest, *viz.*, the objects of attention or consciousness, *i.e.*, presentations. And this exposition will be simplified if we start with a supposition that will enable us to leave aside, at least for the present, the difficult question of heredity.

We know that in the course of each individual's life there is more or less of progressive differentiation or development; we know too that the same holds broadly of a race; and it is believed to hold in like manner of the evolution of the animal kingdom generally. It is believed that there has existed a series of sentient individuals beginning with the lowest form of life and advancing continuously up to man. Some traces of the advance already made may be reproduced in the growth of each human being now, but for the most part such traces have been obliterated. What was experience in the past has become instinct in the present. The descendant has no consciousness of his ancestors' failures when performing by "an

² Compare "Gefühle der Lust und Unlust und der Wille . . . die gar nicht Erkenntnisse sind" (*Kritik der reinen Vernunft*, Hartenstein's ed., p. 76).

³ *Lectures on Metaphysics*, ii. p. 432.

⁴ But, while we cannot say that we know what attention and feeling are, inasmuch as they are not presented, neither can we with any propriety maintain that we are ignorant of them, inasmuch as they are by their very nature unpresentable. As Ferrier contends, "we can be ignorant only of what can possibly be known; in other words, there can be ignorance only of that of which there can be knowledge" (*Institutes of Metaphysics*, § II., Agnology, prop. iii. *sq.*). The antithesis between the objective and the subjective factors in presentation is wider than that between knowledge and ignorance, which is an antithesis pertaining to the objective side alone.

untaught ability" what they slowly and painfully found out. But if we are to attempt to follow the genesis of mind from its earliest dawn it is the primary experience rather than the eventual instinct that we have first of all to keep in view. To this end, then, it is proposed to assume that we are dealing with one individual which has continuously advanced from the beginning of psychical life, and not with a series of individuals of which all save the first have inherited certain capacities from its progenitors. The life-history of such an imaginary individual, that is to say, would correspond with all that was new, all that could be called evolution or development, in a certain typical series of individuals each of whom advanced a certain stage in mental differentiation. On the other hand, from this history would be omitted that inherited reproduction of ancestral experience, or tendency to its reproduction, by which alone, under the actual conditions of existence, progress is possible.

If an assumption of this kind had been explicitly avowed by the psychologists who have discussed the growth of experience in accordance with the evolution hypothesis, not a few of the difficulties in the way of that hypothesis might have been removed. That individual minds make some advance in the complexity and distinctness of their presentations between birth and maturity is an obvious fact; heredity, though a less obvious fact, is also beyond question. Using Locke's analogy of a writing-tablet—or let us say an etching-tablet—by way of illustration, we may be sure that every individual started with some features of the picture completely performed, however latent, others more or less clearly outlined, and others again barely indicated, while of others there is as yet absolutely no trace. But the process of reproducing the old might differ as widely from that of producing the new as electrotyping does from engraving. However, as psychologists we know nothing directly about it; neither can we distinguish precisely at any link in the chain of life what is old and inherited—original in the sense of Locke and Leibnitz—from what is new or acquired—original in the modern sense. But we are bound as a matter of method to suppose all complexity and differentiation among presentations to have been originated, *i.e.*, experimentally acquired, at some time or other. So long, then, as we are concerned primarily with the progress of this differentiation we may disregard the fact that it has not actually been, as it were, the product of one hand dealing with one *tabula rasa* but of many hands, each of which, starting with a reproduction of what had been wrought on the preceding *tabula*, put in more or fewer new touches before devising the whole to a successor who would proceed in like manner.

The presentation-continuum.

What is implied in this process of differentiation or mental growth and what is it that grows or becomes differentiated?—these are the questions to which we must now attend. Psychologists have usually represented mental advance as consisting fundamentally in the combination and recombination of various elementary units, the so-called sensations and primitive movements, or, in other words, in a species of "mental chemistry." If we are to resort to physical analogies at all—a matter of very doubtful propriety—we shall find in the growth of a seed or an embryo far better illustrations of the unfolding of the contents of consciousness than in the building up of molecules: the process seems much more a segmentation of what is originally continuous than an aggregation of elements at first independent and distinct. Comparing—higher minds or stages of mental development with lower—by what means such comparison is possible we need not now consider—we find in the higher conspicuous differences between presentations which in the lower are indistinguishable or ab-

sent altogether. The worm is aware only of the difference between light and dark. The steel-worker sees half a dozen tints where others see only a uniform glow. To the child, it is said, all faces are alike; and throughout life we are apt to note the general, the points of resemblance, before the special, the points of difference.¹ But, even when most definite, what we call a presentation is still part of a larger whole. It is not separated from other presentations, whether simultaneous or successive, by something which is not of the nature of presentation, as one island is separated from another by the intervening sea, or one note in a melody from the next by an interval of silence. In our search for a theory of presentations, then, it is from this "unity of consciousness" that we must take our start. Working backwards from this as we find it now, we are led alike by particular facts and general considerations to the conception of a *totum objectivum* or objective continuum which is gradually differentiated, thereby becoming what we call distinct presentations, just as with mental growth some particular presentation, clear as a whole, as Leibnitz would say, becomes a complex of distinguishable parts. Of the very beginning of this continuum we can say nothing: absolute beginnings are beyond the pale of science. Actual presentation consists in this continuum being differentiated; and every differentiation constitutes a new presentation. Hence the commonplace of psychologists:—We are only conscious as we are conscious of change.

But "change of consciousness" is too loose an expression to take the place of the unwieldy phrase differentiation of a presentation-continuum, to which we have been driven. For not only does the term "consciousness" confuse what exactness requires us to keep distinct, an activity and its object, but also the term "change" fails to express the characteristics which distinguish presentations from other changes. Differentiation implies that the simple becomes complex or the complex more complex; it implies also that this increased complexity is due to the persistence of former changes; we may even say such persistence is essential to the very idea of development or growth. In trying, then, to conceive our psychological individual in the earliest stages of development we must not picture it as experiencing a succession of absolutely new sensations, which, coming out of nothingness, admit of being strung upon the "thread of consciousness" like beads picked up at random, or cemented into a mass like the bits of stick and sand with which the young caddis covers its nakedness. The notion, which Kant has done much to encourage, that psychical life begins with a confused manifold of sensations not only without logical but without psychological unity is one that becomes more inconceivable the more closely we consider it. An absolutely new presentation, having no sort of connexion with former presentations till the subject has synthesized it with them, is a conception for which it would be hard to find a warrant either by direct observation, by inference from biology, or in considerations of an *a priori* kind. At any given moment we have a certain whole of presentations, a "field of consciousness" psychologically one and continuous; at the next we have not an entirely new field but a partial change within this field. Many who would allow this in the case of representations, *i.e.*, where idea succeeds idea by the workings of association, would demur to it in the case of primary presentations or sensations. "For," they would say, "may not silence be broken by a clap of thunder, and have not the blind been made to see?" To

¹ This last statement is apt to mislead by implying an active comparison of several objects; but that absence or confusion of differences which hides the many is really very different from the detection of resemblances which makes the many one.

urge such objections is to miss the drift of our discussion, and to answer them may serve to make it clearer. Where silence can be broken there are representations of preceding sounds and in all probability even subjective presentations of sound as well; silence as experienced by one who has heard is very different from the silence of Condillac's statue before it had ever heard. The question is rather whether such a conception as that of Condillac's is possible; supposing a sound to be, qualitatively, entirely distinct from a smell, could a field of consciousness consisting of smells be followed at once by one in which sounds had part? And, as regards the blind coming to see, we must remember not only that the blind have eyes but that they are descended from ancestors who could see. What nascent presentations of sight are thus involved it would be hard to say; and the problem of heredity is one that we have for the present left aside.

The view here taken is (1) that at its first appearance in psychical life a new sensation or so-called elementary presentation is really a partial modification of some pre-existing presentation, which thereby becomes as a whole more complex than it was before; and (2) that this complexity and differentiation of parts never become a plurality of discontinuous presentations, having a distinctness and individuality such as the atoms or elementary particles of the physical world are supposed to have. Beginners in psychology, and some who are not beginners, are apt to be led astray by expositions which begin with the sensations of the special senses, as if these furnished us with the type of an elementary presentation. The fact is we never experience a mere sensation of colour, sound, touch, and the like; and what the young student mistakes for such is really a perception, a sensory presentation combined with various sensory and motor presentations and with representations—and having thus a definiteness and completeness only possible to complex presentations. Moreover, if we could attend to a pure sensation of sound or colour by itself, there is much to justify the suspicion that even this is complex and not simple, and owes to such complexity its clearly marked specific quality. In certain of our vaguest and most diffused organic sensations, in which we can distinguish little besides variations in intensity and massiveness, there is probably a much nearer approach to the character of the really primitive presentations.

Diffusion and restriction. The importance of getting a firm grasp of this conception of a presentation-continuum as fundamental to the whole doctrine of presentations will justify us in ignoring a little longer the details of actual mental development and regarding it first from this more general point of view. In a given sensation, more particularly in our organic sensations, we can distinguish three variations, viz., variations of quality, of intensity, and of what Dr Bain has called massiveness, or, as we will say, extensivity. This last characteristic, which everybody knows who knows the difference between the ache of a big bruise and the ache of a little one, between total and partial immersion in a bath, is, as we shall see later on, an essential element in our perception of space. But it is certainly not the whole of it, for in this experience of massive sensation alone it is impossible to find other elements which an analysis of spatial intuition unmistakably yields. Extensivity and extension, then, are not to be confounded. Now we find, even at our level of mental evolution, that an increase in the intensity of a sensation is apt to entail an increase in its extensivity too; this is still more apparent in the case of movements, and especially in the movements of the young. In like manner we observe a greater extent of movement in emotional expression when the intensity of the emotion increases. Even the higher region of ima-

gination is no exception, as is shown by the whirl and confusion of ideas incident to delirium, and, indeed, to all strong excitement. But this "diffusion" or "radiation," as it has been called, diminishes as we pass from the class of organic sensations to the sensations of the five senses, from movements expressive of feeling to movements definitely purposive, and from the tumult of ideas excited by passion to the steadier sequences determined by efforts to think. Increased differentiation seems, then, to be intimately connected with increased "restriction." The causal relations of the two must be largely matter of conjecture and cannot be fully discussed here. Probably there may be found certain initial differentiations which for psychology are ultimate facts that it cannot explain. But, such differentiations being given, then it may be safely said that, in accordance with what we have called the principle of subjective selection (see p. 42), attention would be voluntarily concentrated upon some of them and voluntary movements specially connected with these. To such subjectively initiated modifications of the presentation-continuum, moreover, we may reasonably suppose "restriction" to be in large measure due. But increased restriction would render further differentiation of the given presentation possible and so the two processes might supplement each other. But, be their interaction what it may, these processes have now proceeded so far that at the level of human consciousness we find it hard to form any tolerably clear conception of a field of consciousness in which an intense sensation, no matter what, might diffuse over the whole. Colours, *e.g.*, are with us so distinct from sounds that—except as regards the drain upon attention—there is nothing in the intensest colour to affect the simultaneous presentation of a sound. But at the beginning whatever we regard as the earliest differentiation of sound might have been inco-presentable with the earliest differentiation of colour, if sufficiently diffused, just as now a field of sight all blue is inco-presentable with one all red. Or, if the stimuli appropriate to both were active together, the resulting sensation might have been what we should describe as a blending of the two, as purple is a blending of red and violet. Now, on the other hand, colours and sounds are necessarily so far localized that we are directly aware that the eye is concerned with the one and the ear with the other. This brings to our notice a fact so ridiculously obvious that it has never been deemed worthy of mention, and yet it has undeniably important bearings—the fact, viz., that certain sensations or movements are an absolute bar to the simultaneous presentation of other sensations or movements. We cannot see an orange as at once yellow and green, though we can feel it at once as both smooth and cold; we cannot open and close the same hand at the same moment, but we can open one hand while closing the other. Such inco-presentability or contrariety is thus more than mere difference, and occurs only between presentations belonging to the same sense or to the same group of movements. Strictly speaking, it does not always occur even then; for red and yellow, hot and cold, are presentable together provided they have certain other differences which we shall meet again presently as differences of local sign.

In the preceding paragraphs we have had occasion to distinguish between the presentation-continuum or whole field of consciousness, as we may for the present call it, and those several modifications within this field which are ordinarily spoken of as presentations, and to which—now that their true character as parts is clear—we too may confine the term. But it will be well in the next place, before inquiring more closely into their characteristics, to consider for a moment that persistence of preceding modifications which the differentiation of the presentation-

Inco-presentability.

Retentiveness.

continuum implies. This persistence is best spoken of as retentiveness; it is sometimes confounded with memory, though this is something much more complex and special. Retentiveness is both a biological and a psychological fact; memory is exclusively the latter. In memory there is necessarily some contrast of past and present, in retentiveness nothing but the persistence of the old. If psychologists have erred in regarding the presentations in consciousness together as a plurality of units, they have erred in like manner concerning the persisting residua of such presentations. As we see a certain colour or a certain object again and again, we do not go on accumulating images or representations of it, which are somewhere crowded together like shades on the banks of the Styx; nor is such colour, or whatever it be, the same at the hundredth time of presentation as at the first, as the hundredth impression of a seal on wax would be. There is no such constancy or uniformity in mind. Obvious as this must appear when we pause to think of it, yet the explanations of perception most in vogue seem wholly to ignore it. Such explanations are far too mechanical and, so to say, atomistic; but we must fall back upon the unity and continuity of our presentation-continuum if we are to get a better. Suppose that in the course of a few minutes we take half a dozen glances at a strange and curious flower. We have not as many complex presentations which we might symbolize as F_1, F_2, F_3 . But rather, at first only the general outline is noted, next the disposition of petals, stamens, &c., then the attachment of the anthers, form of the ovary, and so on; that is to say, symbolizing the whole flower as $[p' (a b) s' (c d) o' (f g)]$, we first apprehend say $[p' \dots s' \dots o']$, then $[p' (a b) s' \dots o']$, or $[p' (a \dots) s' (c \dots) o' (f \dots)]$, and so forth. It is because the earlier apprehensions persist that the later are an advance upon them and an addition to them. There is nothing in this process properly answering to the reproduction and association of ideas: in the last and complete apprehension as much as in the first vague and inchoate one the flower is there as a primary presentation. There is a limit, of course, to such a procedure, but the instance taken, we may safely say, is not such as to exceed the bounds of a simultaneous field of consciousness. Now the question is: Ought we not to assume that such increase of differentiation through the persistence of preceding differentiations holds of the contents of consciousness as a whole? Here, again, we shall find limitations,—limitations too of great practical importance; for, if presentations did not pale as well as persist, and if the simpler presentations admitted of indefinite differentiation, mental advance—unless the field of consciousness, *i.e.*, the number of presentations to which we could attend together, increased without limit—would be impossible. But, allowing all this, it is still probably the more correct and fundamental view to suppose that, in those circumstances in which we now have a sensation of, say, red or sweet, there was in the primitive consciousness nothing but a vague modification, which persisted; and that on a repetition of the circumstances this persisting modification was again further modified. The whole field of consciousness would thus, like a continually growing picture, increase indefinitely in complexity of pattern, the earlier presentations not disappearing, like the waves of yesterday in the calm of to-day, but rather lasting on, like old scars that show beneath new ones.

Subcon-
scious-
ness.

There is yet one more topic of a general kind calling for attention before we turn to the consideration of particular presentations—the hypothesis of unconscious mental modifications, as it has been unfortunately termed,—the hypothesis of subconsciousness, as we may style it to avoid this contradiction in terms. It is a fact easily

verified, that we do not distinguish or attend separately to presentations of less than a certain assignable intensity. On attaining this intensity presentations are said to pass over the threshold of consciousness, to use 'Herbart's now classic phrase. What are we to say of them before they have attained it? After they have attained it, any further increase in their intensity is certainly gradual; are we then to suppose that before this their intensity changed instantly from zero to a finite quantity, and not rather that there was also a subliminal stage where too it only changed continuously? The latter alternative constitutes the hypothesis of subconsciousness. According to this hypothesis, a presentation does not cease to be so long as it has any intensity, no matter how little. We can directly observe that an increase in the intensity of many complex presentations brings to light details and differences before imperceptible; since these details are themselves presentations, they have been brought by this increase from the subconscious stage into the field of consciousness. Similarly, presentations not separately distinguishable, because of too close a proximity in time, become distinguishable when the interval between them is such as to allow of a separate concentration of attention upon each. Again, we find that presentations "revived" or re-presented after their disappearance from the field of consciousness appear fainter and less distinct the longer the time that has elapsed between their exits and their re-entrances. Nobody hesitates to regard such obliviscence as a psychological fact; why, then, should we hesitate to suppose that presentations, even when no longer intense enough directly to influence attention, continue to be presented, though with ever lessening intensity?

On the whole we seem justified in assuming three grades of consciousness thus widely understood—(1) a centre or focus of consciousness within (2) a wider field, any part of which may at once become the focus. Just as in sight, surrounding the limited area of distinct vision on which the visual axes are directed, there is a wider region of indirect vision to any part of which those axes may be turned either voluntarily or by a reflex set up by the part itself, as happens, *e.g.*, with moving objects quite on the margin of vision. But in describing (3) subconsciousness as the third grade, this simile, due to Wundt, more or less forsakes us. Presentations in subconsciousness have not the power to divert attention, nor can we voluntarily concentrate attention upon them. Before either can happen the subconscious presentations must cross the threshold of consciousness, and so cease to be subconscious; and this, of course, is far from being always possible. Now in the case of sight an object may fail to catch the eye, either because, though within the field of sight, it is too far away to make a distinct impression or because it is outside the field altogether. But we cannot conveniently interpret "threshold of consciousness" in keeping with the latter alternative; mere accretion from without is a conception as alien to psychology as it is to biology. We must make the best we can of a *totum objectivum* differentiated within itself, and so are confined to the first alternative. Our threshold must be compared to the surface of a lake and subconsciousness to the depths beneath it, and all the current terminology of presentations rising and sinking implies this or some similar figure.

This hypothesis of subconsciousness has been strangely misunderstood, and it would be hard to say at whose hands it has suffered most, those of its exponents or those of its opponents. In the main it is nothing more than the application to the facts of presentation of the law of continuity, its introduction into psychology being due to Leibnitz, who first formulated that law. Half the difficulties in the way of its acceptance are due to the manifold ambiguities of the word consciousness. With Leibnitz consciousness was not coextensive with all psychical life, but only with certain

higher phases¹ of it. Of late, however, the tendency has been to make consciousness cover all stages of mental development and all grades of presentation, so that a presentation of which there is no consciousness resolves itself into the manifest contradiction of an unrepresented presentation—a contradiction not involved in Leibnitz's "unperceived perception." Moreover, the active form of the word "conscious" almost unavoidably suggests that an "unconscious mental modification" must be one in which that subjective activity, variously called consciousness, attention, or thinking, has no part. But such is not the meaning intended when it is said, for example, that a soldier in battle is often unconscious of his wounds or a scholar unconscious at any one time of most of the knowledge "hidden in the obscure recesses of his mind." There would be no point in saying a subject is not conscious of objects that are not presented at all; but to say that what is presented lacks the intensity requisite in the given distribution of attention to change that distribution appreciably is pertinent enough. Subconscious presentations may tell on conscious life—as sunshine or mist tells on a landscape or the underlying writing on a palimpsest—although lacking either the differences of intensity or the individual distinctness requisite to make them definite features. Even if there were no facts to warrant this conception of a subliminal presentation of impressions and ideas it might still claim an *a priori* justification. For to assume that there can be no presentations save such as pertain to the complete and perfect consciousness of a human being is as arbitrary and as improbable as it would be to suppose—in the absence of evidence to the contrary—that there was no vision or audition save such as is mediated by human eyes and ears. Psychological magnification is not more absurd than physical, although the processes in the two cases must be materially different; but of course in no case is magnification possible without limit. The point is that, while we cannot fix the limit at which the subconscious becomes the absolutely unconscious, it is only reasonable to expect beforehand that this limit is not just where our powers of discrimination cease.

Over and above hindrances to its acceptance which may be set down to the paradoxical and inaccurate use of the word unconsciousness, there are two material difficulties which prevent this hypothesis from finding favour. First, the prevaillingly objective implications of language are apt to make us assume that, as a tree remains the same thing whether it is in the foreground of a landscape or is lost in the grey distance, so a presentation must be a something which is in itself the same whether above the threshold of consciousness or below, if it exist, that is, in this lower degree at all. But it must be remembered that we are not now dealing with physical things but with presentations, and that to these the Berkeleyan *dictum* applies that their *esse* is *percipi*, provided, of course, we give to *percipi* the wide meaning now assigned to consciousness. The qualitative differences of all presentations and the distinctness of structure of such as are complex both diminish with a diminution of intensity. In this sense much is latent or "involved" in presentations lying below the threshold of consciousness that becomes patent or "evolved" as they rise above it. But, on the other hand, the hypothesis of subconsciousness does not commit us to the assumption that all presentations are by their very nature imperishable; while many modifications of consciousness sink only into oblivion, many, we may well suppose, lapse into complete oblivion and from that there is no recall. Secondly, to any one addicted to the atomistic view of presentations just now referred to it may well seem incredible that all the incidents of a long lifetime and all the items of knowledge of a well-stored mind that may possibly recur—"the infinitely greater part of our spiritual treasures," as Hamilton says—can be in any sense present continuously. The brunt of such an objection is effectually met by the fact that the same presentation may figure in very various connexions, as may the same letter, for example, in many words, the same word in many sentences. We cannot measure the literature of a language by its vocabulary, nor may we equate the extent of our spiritual treasures as successively unfolded with the psychical apparatus, so to say, into which they resolve.²

The attempt has more than once been made to avoid the difficulties besetting subconsciousness by falling back on the conceptions of faculties, capacities, or dispositions. Stored-up knowledge, says J. S. Mill, "is not a mental state but a capability of being put into a mental state"; similarly of the cases which Hamilton records, "in which the extinct memory [?] of whole languages was suddenly restored," he says, "it is not the mental impressions that are latent

but the power of reproducing them." But surely the capability of being put into a mental state is itself a mental state and something actual, and is, moreover, a different something when the state to be reproduced is different. If not, how is such capability ever exerted? Even where the capability cannot be consciously exerted, must there not still be something actual to justify the phrase latent power? The "exaltation" of delirium may account for the intensification but not for the contents of the "extinct memories" which its unwonted glow reveals. It seems extraordinary that Mill of all men, and in psychology of all subjects, should have supposed such merely formal conveniences as these conceptions of faculties and powers could ever dispense us from further inquiry. It might be urged in Mill's defence that he has investigated further and concludes that the only distinct meaning he can attach to unconscious mental modification is that of unconscious modification of the nerves—a modification of the nerves, that is to say, without any psychical accompaniment. But, while we can frequently understand a psychical fact better if we can understand its physical counterpart, a physiological explanation can never take the place of a psychological explanation. If all we have to deal with are nervous modifications which have no psychical concomitants, then so far there is nothing psychological to explain; but, if there really is anything calling for psychological explanation—and this Mill does not deny—then physical accompaniments must admit of psychical interpretation if they are to be of any avail. And in fact, although Mill professes to recognize only unconscious modifications of nerves, he finds a psychological meaning for these by means of his "mental chemistry,"—a doctrine which has done its work and which we need not here discuss.

The exposition of subconsciousness given by Wundt is in the main an advance on that of Mill and calls for brief notice. Presentations, says Wundt,³ are not substances but functions, whose physiological counterparts in like manner are functional activities, viz., of certain arrangements of nerve-cells. Consciousness of the presentation and the nervous activity cease together, but the latter leaves behind it a molecular modification of the nervous structure which becomes more and more permanent with exercise, and is such as to facilitate the recurrence of the same functional activity. A more precise account of these after-effects of exercise is for the present unattainable; nevertheless Wundt regards it as obvious that they are no more to be compared to the activity to which they predispose than the molecular arrangement of chlorine and nitrogen in nitric chloride is to be compared to the explosive decomposition that ensues if the chloride is slightly disturbed. *Mutatis mutandis*, on the psychological side the only actual presentations are those which we are conscious of as such; but presentations that vanish out of consciousness leave behind psychical dispositions tending to renew them. The essential difference is that, whereas we may some day know the nature of the physical disposition, that of the psychical disposition must of necessity be for ever unknown, for the threshold of consciousness is also the limit of internal experience. The theory thus briefly summarized seems in some respects arbitrary, in some respects ambiguous. It is questionable, for instance, whether the extremely meagre information that physiologists at present possess at all compels us to assume that the "physical disposition" of Wundt cannot consist in a continuous but much fainter discharge of function. At all events it is quite beside the mark to urge, as he does, that the effect of training a group of muscles is not shown in the persistence of slight movements during intervals of apparent rest.⁴ The absence of molar motions is no evidence of the absence of molecular motions. And it is certain that psychologically we can be conscious of the idea of a movement without the movement actually ensuing, yet only in such wise that the idea is more apt to pass over into action the intenser it is, and often actually passes over in spite of us. Surely there must be some functional activity answering to this conscious presentation, and if this amount of activity is possible without movement why may not a much less amount be conceived possible too? Again, what meaning can possibly be attached to a psychical disposition which is the counterpart, not of physical changes, but of an arrangement of molecules? Compared with such an inconceivable unknown, the perfectly conceivable hypothesis of infinitesimal presentations so faint as to elude discrimination is every way preferable. In fact, if conceivability is to count for anything, we have, according to Wundt, no choice, for "we can never think of a presentation that has disappeared from consciousness except as retaining the properties it had when in consciousness." None the less he holds it to be an error "to apply to presentations themselves a style of conception that has resulted from our being of necessity confined to consciousness." Verily, this is phenomenalism with a vengeance, as if presentations themselves were not also confined to consciousness!

¹ The following brief passage from his *Principes de la Nature et de la Grace* (§ 4) shows his meaning:—"Il est bon de faire distinction entre la Perception, qui est l'état intérieur de la Monade représentant les choses externes, et l'Appréhension, qui est la Conscience, ou la connaissance réflexive de cet état intérieur, laquelle n'est point donnée à toutes les âmes, ni toujours à la même âme. Et c'est faute de cette distinction que les Cartésiens ont manqué, en comptant pour rien les perceptions dont on ne s'apperoit pas, comme le peuple compte pour rien les corps insensibles" (*Op. Phil.*, Erdmann's ed., ii. p. 716).

² Much light may be thrown on this matter and on many others by such inquiries as those undertaken by Mr Francis Galton, and described in his *Inquiries into Human Faculty*, pp. 182-203.

³ *Physiologische Psychologie*, p. 203 sq.

⁴ J. S. Mill adopts substantially the same line of argument: "I have the power to walk across the room, though I am sitting in my chair; but we should hardly call this power a latent act of walking" (*Examination of Sir W. Hamilton's Philosophy*, 3d ed., p. 329).

Relativity.

This will be the most convenient place to take note of certain psychological doctrines which, though differing in some material respects, are usually included under the term Law of Relativity.

1. Hobbes's *Idem semper sentire et non sentire ad idem recidunt* is often cited as one of the first formulations of this law; and if we take it to apply to the whole field of consciousness it becomes at once true and trite: a field of consciousness unaltered either by change of impression or of ideas would certainly be a blank and a contradiction. Understood in this sense the Law of Relativity amounts to what Hamilton called the Law of Variety (Reid's *Works*, p. 932). But, though consciousness involves change, it is still possible that particular presentations in the field of consciousness may continue unchanged indefinitely. When it is said that "a constant impression is the same as a blank," what is meant turns out to be something not psychological at all, as, *e.g.*, our insensibility to the motion of the earth or to the pressure of the air—cases in which there is obviously no presentation, nor even any evidence of nervous change. Or else this paradox proves to be but an awkward way of expressing what we may call accommodation, whether physiological or psychological. Thus the skin soon adapts itself to certain seasonal alterations of temperature, so that heat or cold ceases to be felt: the sensation ceases because the nervous change, its proximate physical counterpart, has ceased. Again, there is what James Mill calls "an acquired incapacity of attention," such that a constant noise, for example, in which we have no interest is soon inaudible. As attention moves away from a presentation its intensity diminishes, and when the presentation is below the threshold of consciousness its intensity is then subliminal, whatever that of the physical stimulus may be. In such a case of psychological accommodation we should expect also to find on the physiological side some form of central reflexion or isolation more or less complete. As a rule, no doubt, impressions do not continue constant for more than a very short time; still there are sad instances enough in the history of disease, bodily and mental, to show that such a thing can quite well happen, and that such constant impressions (and "fixed ideas," which are in effect tantamount to them), instead of becoming blanks, may dominate the entire consciousness, colouring or bewildering everything.

2. From the fact that the field of consciousness is continually changing it has been supposed to follow, not only that a constant presentation is impossible, but as a further consequence that every presentation is essentially nothing but a transition or difference. "All feeling," says Dr Bain, the leading exponent of this view, "is two-sided. . . . We may attend more to one member of the couple than to the other. . . . We are more conscious of heat when passing to a higher temperature, and of cold when passing to a lower. The state we have passed to is our *explicit* consciousness, the state we have passed from is our *implicit* consciousness." But the transition need not be from heat to cold, or *vice versa*: it can equally well take place from a neutral state, which is indeed the normal state, of neither heat nor cold; a new-born mammal, *e.g.*, must experience cold, having never experienced heat. Again, suppose a sailor becalmed, gazing for a whole morning upon a stretch of sea and sky, what sensations are implicit here? Shall we say yellow as the greatest contrast to blue, or darkness as the contrary of light, or both? What, again, is the implicit consciousness when the explicit is sweet; is it bitter or sour, and from what is the transition in such a case?

It is difficult to avoid suspecting a certain confusion here between the transition of attention from one presentation to another and the qualitative differences among presenta-

tions themselves. It is strange that the psychologist who has laid such stress on neutral states of surprise as being akin to feeling, and so distinct from special presentations, should in any way confound the two. The mistake, if mistake indeed it be, is perhaps accounted for by the fact that Dr Bain, in common with the rest of his school, nowhere distinguishes between attention and the presentations that are attended to. To be conscious or mentally alive we must have a succession of shocks or surprises, new objects calling off attention from old ones; but, over and above these movements of attention from presentation to presentation, do we find that each presentation is also itself but a transition or difference? "We do not know any one thing of itself but only the difference between it and another thing," says Dr Bain. But it is plain we cannot speak of contrast or difference between two states or things as a contrast or difference if the states or things are not themselves presented, else the so-called contrast or difference would itself be a single presentation, and its supposed "relativity" but an inference. Difference is not more necessary to the presentation of two objects than two objects to the presentation of difference. And, what is more, a difference between presentations is not at all the same thing as the presentation of that difference. The former must precede the latter; the latter, which requires active comparison, need not follow. There is an ambiguity in the words "know," "knowledge," which Dr Bain seems not to have considered: "to know" may mean either to perceive or apprehend, or it may mean to understand or comprehend.¹ Knowledge in the first sense is only what we shall have presently to discuss as the recognition or assimilation of an impression (see below, p. 53); knowledge in the latter sense is the result of intellectual comparison and is embodied in a proposition. Thus a blind man who cannot know light in the first sense can know about light in the second if he studies a treatise on optics. Now in simple perception or recognition we cannot with any exactness say that two *things* are perceived: straight is a thing, *i.e.*, a definite object presented; not so not-straight, which may be qualitatively obscure or intensively feeble to any degree. Only when we rise to intellectual knowledge is it true to say, "No one could understand the meaning of a *straight* line without being shown a line not straight, a bent or crooked line."² Two distinct presentations are necessary to the comparison that is here implied; but we cannot begin with such definitional differentiation: we must first recognize our objects before we can compare them. We need, then, to distinguish between the comparativity of intellectual knowledge, which we must admit—for it rests at bottom on a purely analytical proposition—and the "differential theory of presentations," which, however plausible at first sight, must be wrong somewhere since it commits us to absurdities. Thus, if we cannot have a presentation *X* but only the presentation of the difference between *Y* and *Z*, it would seem that in like manner we cannot have the presentation of *Y* or *Z*, nor therefore of their difference *X*, till we have had the presentation of *A* and *B* say, which differ by *Y*, and of *C* and *D*, which we may suppose differ by *Z*. The lurking error in this doctrine, that all presentations are but differences, may perhaps emerge if we examine more closely what may be meant by difference. We may speak of (a) differences in intensity between sensations supposed

¹ Other languages give more prominence to this distinction; compare *γινῶναι* and *εἰδέναι*, *noscere* and *scire*, *kennen* and *wissen*, *connaître* and *savoir*. On this subject there are some acute remarks in a little-known book, the *Exploratio Philosophica*, of Professor J. Grote. Hobbes too was well awake to this difference, as, *e.g.*, when he says, "There are two kinds of knowledge; the one, sense or knowledge original and remembrance of the same; the other, science or knowledge of the truth of propositions, derived from understanding."

² Bain, *Logic*, vol. i. p. 3.

to be qualitatively identical, or of (b) differences in quality in the same continuum or class of presentations, or of (c) differences between sensations of different classes or continua. Now, as regards (a) and (b), it will be found that the difference between two intensities of the same quality, or between two qualities of the same continuum, may be itself a distinct presentation. But nothing of this kind holds of (c).¹ In passing from a load of 10 lb to one of 20 lb, or from the sound of a note to that of its octave, it is possible to make the change continuously, and to estimate it as one might the distance between two places on the same road. But in passing from the scent of a rose to the sound of a gong or a sting from a bee we have no such means of bringing the two into relation—scarcely more than we might have of measuring the length of a journey made partly on the common earth and partly through the looking-glass. In (c), then, we have only a change, a difference of presentation, but not a presentation of difference; and we only have more than this in (a) or (b) provided the selected presentations occur together. If red follows green we may be aware of a greater difference than we could if red followed orange; and we should ordinarily call a 10-lb load heavy after one of 5 lb and light after one of 20 lb. Facts like these it is which make the differential theory of presentations plausible.

3. On the strength of such facts Wundt has formulated a law of relativity, free, apparently, from the objections just urged against Dr Bain's doctrine, which runs thus:—"Our sensations afford no absolute but only a *relative* measure of external impressions. The intensities of stimuli, the pitch of tones, the qualities of light, we apprehend (*empfinden*) in general only according to their mutual relation, not according to any unalterably fixed unit given along with or before the impression itself."² We are not now concerned with so much of this statement as relates to the physical antecedents of sensation; but that what is of psychological account in it requires very substantial qualification is evident at once from a single consideration, viz., that if true this law would make it quite immaterial what the impressions themselves were: provided the relation continued the same, the sensation would be the same too, just as the ratio of 2 to 1 is the same whether our unit be miles or millimetres. In the case of intensities, e.g., there is a *minimum sensible* and a *maximum sensible*. The existence of such extremes is alone sufficient to turn the flank of the thoroughgoing relativists; but there are instances enough of intermediate intensities that are directly recognized. A letter-sorter, for example, who identifies an ounce or two ounces with remarkable exactness identifies each for itself and not the first as half the second; of an ounce and a half or of three ounces he may have a comparatively vague idea. And so generally within certain limits of error, *indirectly ascertained*, we can identify intensities, each for itself, neither referring to a common standard nor to one that varies from time to time—to any intensity, that is to say, that chances to be simultaneously presented; just as an enlisting sergeant will recognize a man fit for the Guards without a yard measure and whether the man's comrades are tall or short. Of course such identification is only possible through the reproduction of past impressions, but then such reproduction itself is only possible because the several impressions concerned have all along had a certain independence of related impressions, and a certain identity among themselves. As

¹ Common language seems to recognize some connexion even here, or we should not speak of harsh tastes and harsh sounds, or of dull sounds and dull colours, and so forth. All this is, however, super-added to the sensation, probably on the ground of similarities in the accompanying organic sensations.

² *Physiologische Psychologie*, 1st ed., p. 421; the doctrine reappears in the 2d ed., but no equally general statement of it is given.

regards the qualities of sensations the outlook of the relativists is, if anything, worse. In what is called Meyer's experiment, e.g. (described under EYE, vol. viii. p. 825), what appears greenish on a red ground will appear of an orange tint on a ground of blue; but this contrast is only possible within certain very narrow limits. In fact, the phenomena of colour-contrast, so far from proving, distinctly disprove that we apprehend the qualities of light only according to their mutual relation. In the case of tones it is very questionable whether such contrasts exist at all. Summing up on the particular doctrine of relativity of which Wundt is the most distinguished adherent, the truth seems to be that, in some cases where two presentations whose difference is itself presentable occur in close connexion, this difference—as we indirectly learn—exerts a certain bias on the assimilation or identification of one or both of the presentations. There is no "unalterably fixed unit" certainly, but, on the other hand, "the mutual relations of impressions" are not everything.³

Sensation and Movement.

One of the first questions to arise concerning our simplest presentations or *sensations*⁴ is to account for their differences of quality. In some respects it may well seem an idle question, for at some stage or other we must acknowledge final or irresolvable differences. Still, differences can be frequently shown to be due to variety in the number, arrangement, and intensity of parts severally the same, — these several parts being either simultaneously presented or succeeding each other with varying intervals. It is a sound scientific instinct which has led writers like (J. H. Lewes and Mr Spencer to look out for evidence of some simple primordial presentation—the psychical counterpart, they supposed, of a single nerve-shock or neural tremor—out of which by various grouping existing sensations have arisen. It must, however, be admitted that but little of such evidence is at present forthcoming; and further, if we look at the question for a moment from the physiological standpoint which these writers are too apt to affect, what we find seems on the whole to make against this assumption. Protoplasm in its simplest state is readily irritated either by light, heat, electricity, or mechanical shock. Till the physiological characteristics of these various stimuli are better known, it is fruitless to speculate as to the nature of primitive sensation. But we have certainly no warrant for supposing that any existing class of sensations is entitled to rank as original. Touch, as we experience it now, is probably quite as complex as any of our special sensations. If a supposition must be ventured at all, it is perhaps most in keeping with what we know to suppose that the sensations answering to the five senses in their earliest form were only slightly differing variations of the more or less massive organic sensation which constituted the primitive presentation-continuum. We may suppose, in other words, that at the outset these sensations corresponded more completely with what we might call the general physiological action of light, heat, &c., as distinct from the action of these stimulants on specially differentiated end-organs. But, short of resolving such sensations into combinations of one primordial modification of consciousness, if we could conceive such, there are many interesting facts which point clearly to a complexity that we can seldom directly detect. Many of our supposed sensations of taste, e.g., are complicated with sensations of

Qualitative differences.

³ Those who, like Helmholtz, explain the phenomena of contrast and the like as illusions of judgment, must class them as cases of comparativity; those who, like Hering, explain them physiologically, would see in them nothing but physiological adaptation.

⁴ For a detailed account of the various sensations and perceptions pertaining to the several senses the reader is referred to the articles EYE, EAR, TOUCH, TASTE, SMELL, &c.

touch and smell: thus the pungency of pepper and the dryness of wine are tactual sensations, and their spicy flavours are really smells. How largely smells mingle with what we ordinarily take to be simply tastes is best brought home to us by a severe cold in the head, as this temporarily prevents the access of exhalations to the olfactory surfaces. The difference between the smooth feel of a polished surface and the roughness of one that is unpolished, though to direct introspection an irresolvable difference of quality, is probably due to the fact that several nerve-terminations are excited in each case: where the sensation is one of smoothness all are stimulated equally; where it is one of roughness the ridges compress the nerve-ends more, and the hollows compress them less, than the level parts do. The most striking instance in point, however, is furnished by musical timbre (see *EAR*, vol. vii. p. 593).

We find other evidence of the complexity of our existing sensations in the variations in quality that accompany variations in intensity, extensity, and duration. With the exception of spectral red all colours give place, sooner or later, to a mere colourless grey as the intensity of the light diminishes, and all in like manner become indistinguishably white after a certain increase of intensity. A longer time is also in most cases necessary to produce a sensation of colour than to produce a sensation merely of light or brightness: the solar spectrum seen for a moment appears not of seven colours but of two only—faintly red towards the left side and blue towards the right. Very small objects, again, such as coloured specks on a white ground, though still distinctly seen, appear as colourless if of less than a certain size, the relation between their intensity and extensity being such that within certain limits the brighter they are the smaller they may be without losing colour, and the larger they are the fainter in like manner. Similar facts are observable in the case of other senses, so that generally we seem justified in regarding what we now distinguish as a sensation as probably complicated in several respects. In other words, if psychical magnification were possible, we might be directly aware that sensations which we now suppose to be both single and simple were both compound and complex—that they consisted, that is, of two or more sensational elements or changes, alike or different in quality, of uniform or variable intensity, and occurring either simultaneously or in regular or irregular succession.

It is interesting to note that all possible sensations of colour, of tone, and of temperature constitute as many groups of qualitative continua. By continuum is here meant a series of presentations changing gradually in quality, *i.e.*, so that any two differ less the more they approximate in the series. We may represent this relation among presentations spatially, so long as the differences do not exceed three. In this way our normal colour-sensations have been compared to a sphere, in which (*a*) the maximum of luminosity is at one pole and the minimum at the other; (*b*) the series of colours proper (red to violet and through purple back to red), constituting a closed line, are placed round the equator or in zones parallel to it, according to shade; and (*c*) the amount of saturation (or absence of white) for any given zone of illumination increases with distance from the axis. The several musical tones, again, have been compared to an ascending spiral, a given tone and its octaves lying in the same perpendicular. Temperatures similarly might be represented as ranging in opposite directions, *i.e.*, through heat or through cold, between a zero of no sensation and the organic sensations that accompany the destructive action of heat and cold alike. As we frequently experience a continuous range of intensity of varying amount, so we may experience

continuous variations in quality, as in looking at the rainbow, for example. Still it is not to be supposed that colours or notes are necessarily presented as continua: that they are such is matter of after-observation.

The groups of sensations known as touches, smells, tastes, on the other hand, do not constitute continua: bitter tastes, for instance, will not shade off into acid or sweet tastes, except, of course, through a gradual diminution of intensity rendering the one quality subliminal followed by a gradual increase from zero in the intensity of the other. This want of continuity might be explained if there were grounds for regarding these groups as more complex than the rest,—in so far as tertiary colours or vowel-sounds, say, are complex and comparatively discontinuous. But it might equally well be argued that they are simpler than the rest and, as simple and different, are necessarily disparate, while the continuity of colours or tones is due to a gradual change of components.

Our motor presentations contrast with the sensory by their want of striking qualitative differences. We may divide them into two groups, (*a*) motor presentations proper and (*b*) auxilio-motor presentations. The former answer to our "feelings of muscular effort" or "feelings of innervation." The latter are those presentations due to the straining of tendons, stretching and flexing of the skin, and the like, by which the healthy man knows that his efforts to move are followed by movement, and so knows the position of his body and limbs. It is owing to the absence of these presentations that the anæsthetic patient cannot directly tell whether his efforts are effectual or not, nor in what position his limbs have been placed by movements from without. Thus under normal circumstances motor presentations are always accompanied by auxilio-motor; but in disease and in passive movements they are separated and their distinctness thus made manifest. Originally we may suppose auxilio-motor objects to form one imperfectly differentiated continuum, but now, as with sensations, movements have become a collection of special continua, *viz.*, the groups of movements possible to each limb and certain combinations of these.

Perception.

In treating apart of the differentiation of our sensory and motor continua, as resulting merely in a number of distinguishable sensations and movements, we have been compelled by the exigencies of exposition to leave out of sight another process which really advances *pari passu* with this differentiation, *viz.*, the integration or synthesis of these proximately elementary presentations into those complex presentations which are called perceptions, intuitions, sensori-motor reactions, and the like. It is, of course, not to be supposed that in the evolution of mind any creature attained to such variety of distinct sensations and movements as a human being possesses without making even the first step towards building up this material into the most rudimentary knowledge and action. On the contrary, there is every reason to think, as has been said already incidentally, that further differentiation was helped by previous integration, that perception prepared the way for distincter sensations, and purposive action for more various movements. This process of synthesis, which is in the truest sense a psychical process, deserves some general consideration before we proceed to the several complexes that result from it. Most complexes, certainly the most important, are consequences of that principle of subjective selection whereby interesting sensations lead through the intervention of feeling to movements; and the movements that turn out to subserve such interest come to have a share in it. In this way—which we need not stay to examine more closely now—it happens that, in the

Qualitative continuity.

alternation of sensory and motor phases which is common to all psychical life, a certain sensation, comparatively intense, and a certain movement, definite enough to control that sensation, engage attention in immediate succession, to the more or less complete exclusion from attention of the other less intense sensations and more diffused movements that accompany them. Apart from this intervention of controlling movements, the presentation-continuum, however much differentiated, would be for all purposes of knowledge little better than the disconnected manifold for which Kant took it. At the same time it is to be remembered that the subject obtains command of particular movements out of all the mass involved in emotional expression only because such movements prove on occurrence adapted to control certain sensations. Before experience, and apart from heredity, there seems not only no scientific warrant for assuming any sort of practical prescience but also none for the hypothesis of *a priori* forms of knowledge. Of a pre-established harmony between the active and passive phases of consciousness we need none, or—it may be safer to say—at least indefinitely little. A sentient creature moves first of all because it feels, not because it intends. A long process, in which natural selection probably played the chief part at the outset—subjective selection becoming more prominent as the process advanced—must have been necessary to secure as much purposive movement as even a lobster displays. It seems impossible to except from this process the movements of the special sense-organs which are essential to our perception of external things. Here too subjective interest will explain, so far as psychological explanation is possible, those syntheses of motor and sensory presentations which we call spatial perceptions and intuitions of material things. For example, some of the earliest lessons of this kind seem to be acquired, as we may presently see, in the process of exploring the body by means of the limbs,—a process for which grounds in subjective interest can obviously never be wanting.

The mere process of “association”—whereby we may suppose the synthesis of presentations to be effected so that presentations originally in no way connected tend to move in consciousness together—will confront us with its own problems later on. We need for the present only to bear in mind that the conjunction or continuity upon which the association primarily depends is one determined by the movements of attention, which movements in turn depend very largely upon the pleasure or pain that presentations occasion. To some extent, however, there is no doubt that attention may pass non-voluntarily from one indifferent presentation to another, each being sufficiently intense to give what has been called a “shock of surprise,” but not so intense as to awaken feeling to move for their detention or dismissal. But throughout the process of mental development, where we are concerned with what is new, the range of such indifference is probably small: indifferent presentations there will be, but that does not matter while there are others that are interesting to take the lead.

Meaning
of per-
ception.

Perception as a psychological term has received various, though related, meanings for different writers. It is sometimes used for the recognition of a sensation or movement as distinct from its mere presentation, and thus is said to imply the more or less definite revival of certain residua or re-presentations of past experience which resembled the present. More frequently it is used as the equivalent of what has been otherwise called the “localization and projection” of sensations,—that is to say, a sensation presented either as an affection of some part of our own body regarded as extended or as a state of some foreign body beyond it. According to the former usage, strictly taken, there might be perception without any spatial presentation at all: a sensation that had been attended to a

few times might be perceived as familiar. Such percept being a “presentative-representative” complex, and wholly sensory, we might symbolize it, details apart, as $S + s$, using S for the present sensation, and s for a former S re-presented. According to the latter usage, an entirely new sensation, provided it were complicated with motor experiences in the way required for its localization or projection, would become a perception. Such a perception might be roughly symbolized as $X + (M + m)$, or as $X + m$ simply, M standing for actual movements, as in ocular adjustment, which in some cases might be only former movements re-presented or m . But as a matter of fact actual perception probably invariably includes both cases: impressions which we recognize we also localize or project, and impressions which are localized or projected are never entirely new;—they are, at least, perceived as sounds or colours or aches, &c. It will, however, frequently happen that we are specially concerned with only one side of the whole process, as is the case with a tea-taster or a colour-mixer on the one hand, or, on the other, with the patient who is perplexed to decide whether what he sees and hears is “subjective,” or whether it is “real.” Usually we have more trouble to discriminate the quality of an impression than to fix it spatially; indeed this latter process was taken for granted by most psychologists till recently. But, however little the two sides are actually separated, it is important to mark their logical distinctness, and it would be well if we had a precise name for each. In any other science save psychology such names would be at once forthcoming: but it seems the fate of this science to be restricted in its terminology to the ill-defined and well-worn currency of common speech, with which every psychologist feels at liberty to do what is right in his own eyes, at least within the wide range which a loose connotation allows. If there were any hope of their general acceptance we might propose to call the first-mentioned process the *assimilation* or *recognition* of an impression, and might apply the term *localization* to its spatial fixation, without distinguishing between the body and space beyond,—a matter of the less importance as projection hardly enters into primitive spatial experience. But there is still a distinction called for: perception as we now know it involves not only localization, or “spatial reference,” as it is not very happily termed, but “objective reference” as well. We may perceive sound or light without any presentation of that which sounds or shines; but none the less we do not regard such sound or light as merely the object of our attention, as having only immanent existence, but as the quality or change or state of a thing, an object distinct not only from the subject attending but from all presentations whatever to which it attends. Here again the actual separation is impossible, because this factor in perception has been so intertwined throughout our mental development with the other two. Still a careful psychological analysis will show that such “reification,” as we might almost call it, has depended on special circumstances, which we can at any rate conceive absent. These special circumstances are briefly the constant conjunctions and successions of impressions, for which psychology can give no reason, and the constant movements to which they prompt. Thus we receive together, *e.g.*, those impressions we now recognize as severally the scent, colour, and “feel” of the rose we pluck and handle. We might call each a “percept,” and the whole a “complex percept.” But there is more in such a complex than a sum of partial percepts; there is the apprehension or intuition of the rose as a thing having this scent, colour, and texture. We have, then, under perception to consider (i.) the assimilation and (ii.) the localization of impressions, and (iii.) the intuition of things.

The range of the terms assimilation or recognition of

Assimilation of impressions.

impressions is wide: between the simplest mental process they may be supposed to denote and the most complex there is a great difference. The penguin that watched unmoved the first landing of man upon its lonely rock becomes as wild and wary as more civilized fowl after two or three visits from its molester: it then recognizes that featherless biped. His friends at home also recognize him though altered by years of peril and exposure. In the latter case some trick of his voice or manner, some "striking" feature, calls up and sustains a crowd of memories of the traveller in the past,—events leading on to the present scene. The two recognitions are widely different, and it is from states of mind more like the latter than the former that psychologists have usually drawn their description of perception. At the outset, they say, we have a primary presentation or impression P , and after sundry repetitions there remains a mass or a series of P residua, $p_1 p_2 p_3 \dots$; perception ensues when, sooner or later, P_n "calls up" and associates itself with these re-presentations or ideas. Much of our later perception, and especially when we are at all interested, awakens, no doubt, both distinct memories and distinct expectations; but, since these imply previous perceptions, it is obvious that the earliest form of recognition, or, as we might better call it, assimilation, must be free from such complications, can have nothing in it answering to the overt judgment, P_n is a P . Assimilation involves retentiveness and differentiation, as we have seen, and prepares the way for re-presentation; but in itself there is no confronting the new with the old, no determination of likeness, and no subsequent classification. The pure sensation we may regard as a psychological myth; and the simple image, or such sensation revived, seems equally mythical, as we may see later on. The n th sensation is not like the first: it is a change in a presentation-continuum that has itself been changed by those preceding; and it cannot with any propriety be said to reproduce these past sensations, for they never had the individuality which such reproduction implies. Nor does it associate with images like itself, since where there is association there must first have been distinctness, and what can be associated can also, for some good time at least, be dissociated.

Localization of impressions.

To treat of the localization of impressions is really to give an account of the steps by which the psychological individual comes to a knowledge of space. At the outset of such an inquiry it seems desirable first of all to make plain what lies within our purview, and what does not, lest we disturb the peace of those who, confounding philosophy and psychology, are ever eager to fight for or against the *a priori* character of this element of knowledge. That space is *a priori* in the epistemological sense it is no concern of the psychologist either to assert or to deny. Psychologically *a priori* or original in such sense that it has been either actually or potentially an element in all presentation from the very beginning it certainly is not. It will help to make this matter clearer if we distinguish what philosophers frequently confuse, viz., the concrete spatial experiences, constituting actual localization for the individual, and the abstract conception of space, generalized from what is found to be common in such experiences. A gannet's mind "possessed of" a philosopher, if such a conceit may be allowed, would certainly afford its tenant very different spatial experiences from those he might share if he took up his quarters in a mole. So, any one who has revisited in after years a place from which he had been absent since childhood knows how largely a "personal equation," as it were, enters into his spatial perceptions. Or the same truth may be brought home to him if, walking with a friend more athletic than himself, they come upon a ditch, which both know to be twelve feet wide, but which the one

feels he can clear by a jump and the other feels he cannot. In the concrete "up" is much more than a different direction from "along." The hen-harrier, which cannot soar, is indifferent to a quarry a hundred feet above it—to which the peregrine, built for soaring, would at once give chase—but is on the alert as soon as it descries prey of the same apparent magnitude, but upon the ground. Similarly, in the concrete, the body is the origin or datum to which all positions are referred, and such positions differ not merely quantitatively but qualitatively. Moreover, our various bodily movements and their combinations constitute a network of co-ordinates, qualitatively distinguishable but geometrically, so to put it, both redundant and incomplete. It is a long way from these facts of perception, which the brutes share with us, to that scientific conception of space as having three dimensions and no qualitative differences which we have elaborated by the aid of thought and language, and which reason may see to be the logical presupposition of what in the order of mental development has chronologically preceded it. That the experience of space is not psychologically original seems obvious—quite apart from any successful explanation of its origin—from the mere consideration of its complexity. Thus we must have a plurality of objects— A out of B , B beside C , distant from D , and so on; and these relations of externality, juxtaposition, and size or distance imply further specialization; for with a mere plurality of objects we have not straight-way spatial differences. Juxtaposition, *e.g.*, is only possible when the related objects form a continuum; but, again, not any continuity is extensive. Now how has this complexity come about?

The first condition of spatial experience seems to lie in what has been noted above (p. 46) as the extensivity of sensation. This much we may allow is original; for the longer we reflect the more clearly we see that no combination or association of sensations varying only in intensity and quality, not even if motor presentations are added, will account for the space-element in our perceptions. A series of touches a, b, c, d may be combined with a series of movements m_1, m_2, m_3, m_4 ; both series may be reversed; and finally the touches may be presented simultaneously. In this way we can attain the knowledge of the coexistence of objects that have a certain quasi-distance between them, and such experience is an important element in our perception of space; but it is not the whole of it. For, as has been already remarked by critics of the associationist psychology, we have an experience very similar to this in singing and hearing musical notes or the chromatic scale. The most elaborate attempt to get extensivity out of succession and coexistence is that of Mr Herbert Spencer. He has done, perhaps, all that can be done, and only to make it the more plain that the entire procedure is a *ὑπερπρότερον*. We do not first experience a succession of touches or of retinal excitations by means of movements, and then, when these impressions are simultaneously presented, regard them as extensive, because they are associated with or symbolize the original series of movements; but, before and apart from movement altogether, we experience that massiveness or extensivity of impressions in which movements enable us to find positions, and also to measure.¹ But it will be objected, perhaps not without

¹ We are ever in danger of exaggerating the competence of a new discovery; and the associationists seem to have fallen into this mistake, not only in the use they have made of the conception of association in psychology in general, but in the stress they have laid upon the fact of movement when explaining our space-perceptions in particular. Indeed, both ideas have here conspired against them,—association in keeping up the notion that we have only to deal with a plurality of discrete impressions, and movement in keeping to the front the idea of sequence. Mill's *Examination of Hamilton* (3d ed., p. 266 sq.) surely ought to convince us that, unless we are prepared to

impatience, that this amounts to the monstrous absurdity of making the contents of consciousness extended. The edge of this objection will be best turned by rendering the conception of extensity more precise. Thus, suppose a postage stamp pasted on the back of the hand; we have in consequence a certain sensation. If another be added beside it, the new experience would not be adequately described by merely saying we have a greater quantity of sensation, for intensity involves quantity, and increased intensity is not what is meant. For a sensation of a certain intensity, say a sensation of red, cannot be changed into one having two qualities, red and blue, leaving the intensity unchanged; but with extensity this change is possible. For one of the postage stamps a piece of wet cloth of the same size might be substituted and the massiveness of the compound sensation remain very much the same. Intensity belongs to what may be called graded quantity: it admits of increment or decrement, but is not a sum of parts. Extensity, on the other hand, does imply plurality: we might call it latent or merged plurality or a "ground" of plurality, inasmuch as to say that a single presentation has massiveness is to say that a portion of the presentation-continuum at the moment undifferentiated is capable of differentiation. Attributing this property of extensity to the presentation-continuum as a whole, we may call the relation of any particular sensation to this larger whole its *local sign*, and can see that, so long as the extensity of a presentation admits of diminution without the presentation becoming nil, such presentation has two or more local signs,—its parts, taken separately, though identical in quality and intensity, having a different relation to the whole. Such difference of relation must be regarded fundamentally as a ground or possibility of distinctness of sign—whether as being the ground or possibility of different complexes or otherwise—rather than as being from the beginning such an overt difference as the term "local sign," when used by Lotze, is meant to imply.¹ From this point of view we may say that more partial presentations are concerned in the sensation caused by two stamps than in that caused by one. The fact that these partial presentations, though identical in quality and intensity, on the one hand are not wholly identical, and on the other are presented only as a quantity and not as a plurality, is explained by the distinctness along with the continuity of their local signs. Assuming that to every distinguishable part of the body there corresponds a local sign, we may allow that at any moment only a certain portion of this continuum is definitely within the field of consciousness; but no one will maintain that a part of one hand is ever felt as continuous with part of the other or with part of the face. This we can only represent by saying that the local signs have an invariable relation to each other: two continuous signs are not one day coincident and the next widely separate.² This last fact is

hardly perhaps implied in the mere massiveness of a sensation, but it will be convenient to include it when speaking of the continuum of local signs as extensive. We have, then, a plurality of presentations constituting a continuum, presented simultaneously as impressions and having certain fixed and invariable relations to each other. Of such experience the typical case is that of passive touch, though the other senses exemplify it. It must be allowed that our conception of space in like manner involves a fixed continuity of positions; but then it involves, further, the possibility of movement. Now in the continuum of local signs there is nothing whatever of this; we might call this continuum an implicit *plenum*. It only becomes the presentation of *occupied space* after its several local signs are complicated or "associated" in an orderly way with *active* touches, when in fact we have experienced the contrast of movements with contact and movements without, *i.e.*, *in vacuo*. It is quite true that we cannot now think of this plenum except as a space, because we cannot divest ourselves of these motor experiences by which we have explored it. We can, however, form some idea of the difference between the perception of space and this one element in the perception by contrasting massive internal sensations with massive superficial ones, or the general sensation of the body as "an animated organism" with our perception of it as extended.

It must seem strange, if this conception of extensity is essential to a psychological theory of space, that it has escaped notice so long. The reason may be that in investigations into the origin of our knowledge of space it was always the *conception* of space and not our concrete space *perceptions* that came up for examination. Now in space as we conceive it one position is distinguishable from another solely by its co-ordinates, *i.e.*, by the magnitude and signs of certain lines and angles, as referred to a certain datum position, or origin; and these elements our motor experiences seem fully to explain. But on reflection we ought, surely, to be puzzled by the question, how these coexistent positions could be known before those movements were made which constitute them different positions. The link we thus suspect to be missing is supplied by the more concrete experiences we obtain from our own body, in which two positions have a qualitative difference or "local colour" independently of movement. True, such positions would not be known as spatial without movement; but neither would the movement be known as spatial had those positions no other difference than such as arises from movement.

We may now consider the part which movement plays in elaborating the presentations of this dimensionless continuum into perceptions of space. In so doing we must bear in mind that this continuum implies the inco-presentability of two impressions having the same local sign, but allows not only of the presentation of impressions of varying massiveness but of several distinct impressions at the same time. As regards the motor element itself, the first point of importance is the inco-presentability and invariability of a series of auxilio-motor presentations, P_1, P_2, P_3, P_4 . P_1 cannot be presented along with P_2 , and from P_4 it is impossible to reach P_1 again save through P_3 and P_2 . Such a series, taken alone, could afford us, it is evident, nothing but the knowledge of an invariable sequence of impressions which it was in our own power to produce. Its psychological interest would lie solely in the fact that, whereas other impressions depend on an objective initiative, these depend on a subjective. But in the course of the movements necessary to the exploration of

say, as Mill seems to do, "that the idea of space is at bottom one of time" (p. 276), we must admit the inadequacy of our experience of movement to explain the origin of it.

¹ To illustrate what is meant by different complexes it will be enough to refer to the psychological implications of the fact that scarcely two portions of the sensitive surface of the human body are anatomically alike. Not only in the distribution and character of the nerve-endings but in the variety of the underlying parts—in one place bone, in another fatty tissue, in others tendons or muscles variously arranged—we find ample ground for diversity in "the local colouring" of sensations. And comparative zoology helps us to see how such diversity has been developed as external impressions and the answering movements have gradually differentiated an organism originally almost homogeneous and symmetrical. Between one point and another on the surface of a sphere there is no ground of difference; but this is no longer true if the sphere revolves round a fixed axis, still less if it also runs in one direction along its axis.

² The improvements in the sensibility of our "spatial sense" consequent on its variations under practice, the action of drugs, &c., are

obviously no real contradiction to this; on the contrary, such facts are all in favour of making extensity a distinct factor in our space experience and one more fundamental than that of movement.

the body—probably our earliest lesson in spatial perception—these auxilio-motor presentations receive a new significance from the active and passive touches that accompany them, just as they impart to these last a significance they could never have alone.

It is only in the resulting complex that we have the presentations of position and of spatial magnitude. For space, though conceived as a coexistent continuum, excludes the notion of omnipresence or ubiquity; two positions l_a and l_b must coexist, but they are not strictly distinct positions so long as we conceive ourselves present in the same sense in both. But, if F_a and F_b are, e.g., two impressions produced by compass-points touching two different spots as l and l_b on the hand or arm, and we place a finger upon l_a and move it to l_b , experiencing thereby the series P_1, P_2, P_3, P_4 , this series constitutes l_a and l_b into positions and also invests F_a and F_b with a relation not of mere distinctness but of definite distance. The resulting complex perhaps admits of symbolization as follows:—

..... $F_a F_b F_c F_d F_e F_f F_g F_h F_k$
 $T \quad t \quad t \quad t$
 $P_1 P_2 P_3 P_4$

Here the first line represents a portion of the tactual continuum, F_a and F_b being distinct "feels," if we may so say, or passive touches presented along with the fainter sensations of the continuum as a whole; T stands for the active touch of the exploring finger and P_1 for the corresponding auxilio-motor object; the rest of the succession, as not actually present at this stage but capable of revival from past explorations, is symbolized by the $t t t$ and $p_2 p_3 p_4$. When the series of movements is accompanied by active touches without passive there arises the distinction between one's own body and foreign bodies; when the initial movement of a series is accompanied by both active and passive touches, the final movement by active touches only, and the intermediate movements are unaccompanied by either, we get the further presentation of empty space lying between us and them,—but only when by frequent experience of contacts along with those intermediate movements we have come to know all movement as not only succession but change of position. Thus active touches come at length to be projected, passive touches alone being localized in the stricter sense. But in actual fact, of course, the localization of one impression is not perfected before that of another is begun, and we must take care lest our necessarily meagre exposition give rise to the mistaken notion that localizing an impression consists wholly and solely in performing or imaging the particular movements necessary to add active touches to a group of passive impressions. That this cannot suffice is evident merely from the consideration that a single position out of relation to all other positions is a contradiction. Localization, though it depends on many special experiences of the kind described, is not like an artificial product which is completed a part at a time, but is essentially a growth, its several constituent localizations advancing together in definiteness and interconnexion. So far has this development advanced that we do not even imagine the special movements which the localization of an impression implies, that is to say, they are no longer distinctly represented as they would be if we definitely intended to make them: the past experiences are "retained," but too much blended in the mere perception to be appropriately spoken of as remembered or imaged.

Apropos of this almost instinctive character of even our earliest spatial perceptions it will be appropriate to animadvert on a misleading implication in the current use of such terms as "localization," "projection," "bodily reference," "spatial reference," and the like. The implication is that external space, or the body as extended, is in some sort presented or supposed apart from the localization, projection, or reference of impressions to such space. That it may be possible to put a book in its place on a shelf there must be (1) the book, and (2), distinct and apart from it, the place on the shelf.

But in the evolution of our spatial experience impressions and positions are not thus presented apart. We *can* have, or at least we can suppose, an impression which is recognized without being localized; but if it *is* localized this means that a more complex presentation is formed by the addition of new elements, not that a second distinct object is presented and some indescribable connexion established between the impression and it, still less that the impression is referred to something not strictly presented at all. The truth is that the body as extended is from the psychological point of view not perceived at all apart from localized impressions. In like manner impressions projected (or the absence of impressions projected) constitute all that is perceived as the occupied (or unoccupied) space beyond. It is not till a much later stage, after many varying experiences of different impressions similarly localized or projected, that even the mere materials are present for the formation of such an abstract conception of space as "spatial reference" implies. Psychologists, being themselves at this later stage, are apt to commit the oversight of introducing it into the earlier stage which they have to expound.

In a complex presentation, such as that of an orange or intuition of a piece of wax, may be distinguished the following points of things—concerning which psychology may be expected to give an account:—(a) its reality, (b) its solidity or occupation of space, (c) its permanence, or rather its continuity in time, (d) its unity and complexity, and (e) its substantiality and the connexion of its attributes and powers. Though, in fact, these items are most intimately blended, our exposition will be clearer if we consider each for a moment apart.

(a) The terms actuality and reality have each more Actual—than one meaning. Thus what is real, in the sense of *ity or reality*—material, is opposed to what is mental; as the existent or actual it is opposed to the non-existent; and again, what is actual is distinguished from what is possible or necessary. But here both terms, with a certain shade of difference, in so far as actual is more appropriate to movements and events, are used, in antithesis to whatever is ideal or represented, for what is sense-given or presented. This seems at least their primary psychological meaning; and it is the one most in vogue in English philosophy at any rate, over-tinged as that is with psychology.¹ Any examination of this characteristic will be best deferred till we come to deal with ideation generally (see p. 58 below). Meanwhile it may suffice to remark that reality or actuality is not a single distinct element added to the others which enter into the complex presentation we call a thing, as colour or solidity may be. Neither is it a special relation among these elements, like that of substance and attribute, for example. In these respects the real and the ideal, the actual and the possible, are alike; all the elements or qualities within the complex, and all the relations of those elements to each other, are the same in the rose represented as in the presented rose. The difference turns not upon what these elements are, regarded as qualities or relations presented or represented, but upon whatever it is that distinguishes the presentation from the representation of any given qualities or relations. Now this, as we shall see, turns partly upon the relation of such complex presentation to other presentations in consciousness with it, partly upon its relation as a presentation to the subject whose presentation it is. In this respect we find a difference, not only between the simple qualities, such as cold, hard, red, and sweet in strawberry ice, e.g., as presented and as represented, but also, though less conspicuously, in the spatial, and even the temporal, relations which enter into our intuition as distinct from our imagination of it. Where no such difference exists we have passed beyond

¹ Thus Locke says, "Our simple ideas [*i.e.*, presentations or impressions, as we should now say] are all real . . . and not fictions at pleasure; for the mind . . . can make to itself no simple idea more than what it has received" (*Essay*, ii. 30, 2). And Berkeley says, "The ideas imprinted on the senses by the Author of Nature are called *real things*; and those excited in the imagination, being less regular, vivid, and constant, are more properly termed *ideas* or *images of things*, which they copy or represent" (*Prin. of Hum. Know.*, part i. § 33).

the distinction of percept and image to the higher level of conception and thought. So, then, reality or actuality is not strictly an item by itself, but a characteristic of all the items that follow.

Temporality. (b) Here our properly motor presentations or "feelings of effort or innervation" come specially into play. They are not entirely absent in those movements of exploration by which we attain a knowledge of space; but it is when these movements are definitely resisted, or are only possible by increased effort, that we reach the full meaning of body as that which occupies space. Heat and cold, light and sound, the natural man regards as real, and by and by perhaps as due to the powers of things known or unknown, but not as themselves things. At the outset things are all corporeal like his own body, the first and archetypal thing, that is to say: things are intuited only when touch is accompanied by pressure; and, though at a later stage passive touch without pressure may suffice, this is only because pressures depending on a subjective initiative, *i.e.*, on voluntary muscular exertion, have been previously experienced. It is of more than psychological interest to remark how the primordial factor in materiality is thus due to the projection of a subjectively determined reaction to that action of a not-self on which sense-impressions depend,—an action of the not-self which, of course, is not known as such till this projection of the subjective reaction has taken place. Still we must remember that accompanying sense-impressions are a condition of its projection: muscular effort without simultaneous sensations of contact would not yield the distinct presentation of the resistant occupying the space into which we have moved and would move again. Nay more, it is in the highest degree an essential circumstance in this experience that muscular effort, though subjectively initiated, is still only possible when there is contact with something that, as it seems, is making an effort the counterpart of our own. But this something is so far no more than thing-stuff; without the elements next to be considered our psychological individual would fall short of the complete intuition of distinct things.

Unity and complexity. (c) The remaining important factors in the psychological constitution of things might be described in general terms as the time-relations of their components. Such relations are themselves in no way psychologically determined; impressions recur with a certain order or want of order quite independently of the subject's interest or of any psychological principles of synthesis or association whatever. It is essential that impressions should recur, and recur as they have previously occurred, if knowledge is ever to begin; out of a continual chaos of sensation, all matter and no form, such as some philosophers describe, nothing but chaos could result. But a flux of impressions having this real or sense-given order will not suffice; there must be also attention to and retention of the order, and these indispensable processes at least are psychological. Still they need not be further emphasized here, nor would it have been necessary at this point to call them to mind at all had not British empirical philosophers brought psychology into disrepute by overlooking them altogether.

But for its familiarity we should marvel at the fact that out of the variety of impressions simultaneously presented we do not instantly group together all the sounds and all the colours, all the touches and all the smells, but, dividing what is given together, single out a certain sound or smell as belonging with a certain colour and feel, similarly singled out from the rest, to what we call one thing. We might wonder, too—those at least who have made so much of association by similarity ought to wonder—that, say, the white of snow calls up directly, not other shades of white or other colours, but the expectation of cold or of powdery soft-

ness. The first step in this process has been the simultaneous projection into the same occupied space of the several impressions which we thus come to regard as the qualities of the body filling it. Yet such simultaneous and coincident projection would avail but little unless the constituent impressions were again and again repeated in like order so as to prompt anew the same grouping, and unless, further, this constancy in the one group was present along with changes in other groups and in the general field. There is nothing in its first experience to tell the infant that the song of the bird does not inhere in the hawthorn whence the notes proceed, but that the fragrance of the may-flower does. It is only where a group, as a whole, has been found to change its position relatively to other groups, and—apart from causal relations—to be independent of changes of position among them, that such complexes can become distinct unities and yield a world of things. Again, because things are so often a world within themselves, their several parts or members not only having distinguishing qualities but moving and changing with more or less independence of the rest, it comes about that what is from one point of view one thing becomes from another point of view several,—like a tree with its separable branches and fruits, for example. Wherein, then, more precisely, does the unity of a thing consist? This question, so far as it here admits of answer, carries us over to temporal continuity.

(d) Amidst all the change above described there is one thing comparatively fixed: our own body is both constant as a group and a constant item in every field of groups; and not only so, but it is beyond all other things an object of constant and peculiar interest, inasmuch as our earliest pleasures and pains depend solely upon it and what affects it. The body becomes, in fact, the earliest form of self, the first datum for our later conceptions of permanence and individuality. A continuity like that of self is then transferred to other bodies which resemble our own, so far as our direct experience goes, in passing continuously from place to place and undergoing only partial and gradual changes of form and quality. As we have existed—or, more exactly, as the body has been continuously presented—during the interval between two encounters with some other recognized body, so this is regarded as having continuously existed during its absence from us. However permanent we suppose the conscious subject to be, it is hard to see how, without the continuous presentation to it of such a group as the bodily self, we should ever be prompted to resolve the discontinuous presentations of external things into a continuity of existence. It might be said: "Since the second presentation of a particular group would, by the mere workings of psychical laws, coalesce or become identical with the image of the first, this coalescence suffices to 'generate' the conception of continued existence." But such assimilation is only the ground of an intellectual identification and furnishes no motive, one way or the other, for resolving two like things into the same thing: between a second presentation of A and the presentation at different times of two A's there is so far no difference. Real identity no more involves exact similarity than exact similarity involves sameness of things; on the contrary, we are wont to find the same thing alter with time, so that exact similarity after an interval, so far from suggesting one thing, is often the surest proof that there are two concerned. Of such real identity, then, it would seem we must have direct experience; and we have it in the continuous presentation of the bodily self; apart from this it could not be "generated" by association among changing presentations. Other bodies being in the first instance personified, that then is regarded as one thing—from whatever point of view we look at it, whether

as part of a larger thing or as itself compounded of such parts—which has had one beginning in time. But what is it that has thus a beginning and continues indefinitely? This leads to our last point.

Substantiality.

(e) So far we have been concerned only with the combination of sensory and motor presentations into groups and with the differentiation of group from group; the relations to each other of the constituents of each group still for the most part remain. To these relations in the main must be referred the correlative conceptions of substance and attribute, the distinction in substances of qualities and powers, of primary qualities and secondary, and the like.¹

Of all the constituents of things only one is universally present, that above described as physical solidity, which presents itself according to circumstances as impenetrability, resistance, or weight. Things differing in temperature, colour, taste, and smell agree in resisting compression, in filling space. Because of this quality we regard the wind as a thing, though it has neither shape nor colour, while a shadow, though it has both but not resistance, is the very type of nothingness. This constituent is invariable, while other qualities are either absent or change,—form altering, colour disappearing with light, sound and smells intermitting. Many of the other qualities—colour, temperature, sound, smell—increase in intensity until we reach and touch a body occupying space; with the same movement too its visual magnitude varies. At the moment of contact an unvarying tactual magnitude is ascertained, while the other qualities and the visual magnitude reach a fixed maximum; then first it becomes possible by effort to change or attempt to change the position and form of what we apprehend. This tangible plenum we thenceforth regard as the seat and source of all the qualities we project into it. In other words, that which occupies space is psychologically the substantial; the other real constituents are but its properties or attributes, the marks or manifestations which lead us to expect its presence.

Imagination or Ideation.

Impressions and ideas.

Before the intuition of things has reached a stage so complete and definite as that just described, imagination or ideation as distinct from perception has well begun. In passing to the consideration of this higher form of mental life we have to note the distinction between impressions and images or ideas, to which Hume first gave general currency. Hume did not think it "necessary to employ many words in explaining this distinction. Every one of himself will readily perceive the difference . . . ; though it is not impossible but in particular instances they may very nearly approach to each other. Thus in sleep, in a fever, in madness, or in any very violent emotions of soul, our ideas may approach to our impressions; as, on the other hand, it sometimes happens our impressions are so faint and low that we cannot distinguish them from our ideas."² In most cases, no doubt, the obvious difference in intensity, or, as Hume puts it, "in the force or liveliness with which they strike upon the mind," is a sufficient characteristic, but we must examine a good deal further and pay more attention to his uncertain cases if this important distinction is ever to be in any sense psychologically "explained."

To begin with, it is very questionable whether Hume was right in applying Locke's distinction of simple and complex to ideas in the narrower sense as well as to im-

pressions. "That idea of red," says Hume, "which we form in the dark and that impression which strikes our eyes in the sunshine differ only in degree, not in nature."³ But what he seems to overlook is that, whereas there can be a mere sensation red—and such a presentation may for present purposes be regarded as simple—we can only have an image or representation of a red thing or a red form, *i.e.*, of red in some way ideally projected or intuited. In other words, there are no ideas answering to simple or isolated impressions: what are revived in memory and imagination are percepts, not unlocalized sensations and movements. It is not only that we cannot now directly observe such representations,—because, for that matter, we can no longer directly observe even the original presentations as merely elementary impressions; the point rather is that ideas as such are from the first complex, and do not begin to appear in consciousness apart from the impressions which they are said to reproduce till after these impressions have been frequently attended to together, and have been more or less firmly synthesized into percepts or intuitions.

The effects of even the earliest of these syntheses or "associations" of impressions must of course in some way persist, or progress in perception would be impossible. On this account it has been usual to say that "perception" implies both "memory" and "imagination"; but such a statement can be allowed only so long as these terms are vaguely used. The dog's mouth waters only at the sight of food, but the gourmand's mouth will also water at the thought of it. We recognize the smell of violets as certainly as we recognize the colour when the spring brings them round again; but few persons, if any, can recall the scent when the flower has gone, so as to say with Shelley—

"Odours, when sweet violets sicken,
Live within the sense they quicken"—

though most can recall the colour with tolerable clearness. In like manner everybody can perform innumerable complex voluntary movements which only a few can mentally rehearse or describe without the prompting of actual execution. And not only does such reproduction as suffices for perception fall short of that involved in reminiscence or memory in the narrower sense, but the manner in which the constituent elements in a perception are combined differs materially from what is strictly to be called the association of ideas. To realize this difference we need only to observe first how the sight of a suit of polished armour, for example, instantly reinstates and steadily maintains all that we retain of former sensations of its hardness and smoothness and coldness, and then to observe how this same sight gradually calls up ideas now of tournaments, now of crusades, and so through all the changing imagery of romance. Though the percept is complex, it is but a single whole, and the act of perception is single too; but, where, as is the case in memory and imagination, attention passes, whether voluntarily or non-voluntarily, from one representation to another, it is obvious that these several objects of attention are still distinct and that it is directed in turn to each. The term "association" seems only appropriate to the latter. To the connexion of the partial presentations in a complex, whether perception or idea, it would be better to apply the term "complication," which was used in this sense by Herbart, and has been so used by many psychologists since. When we perceive an orange by sight we may say that its taste or feel is represented, when we perceive it by touch we may in like manner say that its colour is represented, symbolizing the whole complex in the first case sufficiently for our present purpose as Ctf , in the second as Fct . We might also symbolize the idea of an orange as seen by $c'tf$ and the idea of an orange as felt by $f'ct$, using the accented letter to signify that different constituents are dominant in the two cases. What we have, then, to observe is briefly (1) that the processes by which the whole complex $c'tf$ or $f'ct$ is brought into consciousness differ importantly from the process by which C or F reinstates and maintains tf or ct , and (2) that c , t , and f never have that distinct existence as representations which they had as presentations or impressions.

The mental synthesis which has taken place in the evolution of the percept can only partially fail in the idea, and never so far as to leave us with a chaotic "manifold" of mere sensational remnants. On the contrary, we find that in "constructive imagination" a new kind of effort is often requisite in order to dissociate these representational com-

¹ The distinction between the thing and its properties, like all the foregoing distinctions, is one that might be more fully treated under the head of "Thought and Conception." Still, inasmuch as the material warrant for these concepts is contained more or less implicitly in our percepts, some consideration of it is in place here.

² *Treatise of Human Nature*, book i. part i. § 1.

³ *Ibid.*

plexes as a preliminary to new combinations. But it is doubtful whether the results of such an analysis are ever the ultimate elements of the percept, that is, merely isolated impressions in a fainter form. We may now try to ascertain further the characteristic marks which distinguish what is imaged from what is perceived.

Charac-
teristics
of ideas.

The most obvious, if not the most invariable, difference is that which, as we have seen, Hume calls the superior force or liveliness of primary presentations as compared with secondary presentations. But what exactly are we to understand by this somewhat figurative language? A simple difference of intensity cannot be all that is meant, for, though we may be momentarily confused, we can perfectly well distinguish the faintest impression from an image, and yet can hardly suppose the faintest impression to be intenser than the most lively image. Moreover, we can reproduce such faintest impressions in idea, so that, if everything depended on intensity, we should be committed to the gratuitous supposition that secondary presentations can secure attention with a less intensity than is required for primary presentations. The whole subject of the intensity of representations awaits investigation. Between moonlight and sunlight or between midday and dawn we could discriminate many grades of intensity; but it does not appear that there is any corresponding variation of intensity between them when they are not seen but imagined. Many persons suppose they can imagine a waxing or a waning sound or the gradual abatement of an intense pain; but what really happens in such cases is probably not a rise and fall in the intensity of a single representation, but a change in the complex represented. In the primary presentation there has been a change of quality along with change of intensity, and not only so, but most frequently a change in the muscular adaptations of the sense-organs too, to say nothing of organic sensations accompanying these changes. A representation of some or all of these attendants is perhaps what takes place when variations of intensity are supposed to be reproduced. Again, hallucinations are often described as abnormally intense images which simply, by reason of their intensity, are mistaken for percepts. But such statement, though supported by very high authority, is almost certainly false, and would probably never have been made if physiological and epistemological considerations had been excluded as they ought to have been. Hallucinations, when carefully examined, seem just as much as percepts to contain among their constituents some primary presentation—either a so-called subjective sensation of sight and hearing or some organic sensation due to deranged circulation or secretion. Now we have noticed already incidentally in a preceding paragraph that primary presentations reinstate and maintain the representational constituents of a percept in a manner very different from that in which what are unmistakably ideas reproduce each other. The intensity and steadiness of the impressional elements are, as it were, shared by the ideational elements in a complex containing both. Intensity alone, then, will not suffice to discriminate, neither will extremes of intensity alone lead us to confuse, impressions and images.

The superior steadiness just mentioned is perhaps a more constant and not less striking characteristic of percepts. Ideas are not only in a continual flux, but even when we attempt forcibly to detain one it varies continually in clearness and completeness, reminding one of nothing so much as of the illuminated devices made of gas jets, common at fêtes, when the wind sweeps across them, momentarily obliterating one part and at the same time intensifying another. There is not this perpetual flow and flicker in what we perceive; for this, unlike the train of ideas, has at the outset neither a logical nor a

psychological continuity. The impressions entering consciousness at any one moment are psychologically independent of each other; they are equally independent of the impressions and images presented the moment before—independent, *i.e.*, as regards their order and character, not, of course, as regards the share of attention they secure. Attention to be concentrated in one direction must be withdrawn from another, and images may absorb it to the exclusion of impressions as readily as a first impression to the exclusion of a second. But, when attention is secured, a faint impression has a fixity and definiteness lacking in the case of even vivid ideas. One ground for this definiteness and independence lies in the localization or projection which accompanies all perception. But why, if so, it might be asked, do we not confound percept and image when what we imagine is imagined as definitely localized and projected? Because we have a contrary percept to give the image the lie; where this fails, as in dreams, or where, as in hallucination, the image obtains in other ways the fixity characteristic of impressions, such confusion does in fact result. But in normal waking life we have the whole presentation-continuum, as it were, occupied and in operation: we are distinctly conscious of being embodied and having our senses about us.

This contrariety between impression and image suggests, however, a deeper question: we may ask, not how it is resolved, but how it is possible. With eyes wide open, and while clearly aware of the actual field of sight and its filling, one can recall or imagine a wholly different scene: lying warm in bed one can imagine oneself out walking in the cold. It is useless to say the terms are different, that what is perceived is present and what is imaged is past or future.¹ The images, it is true, have certain temporal marks—of which more presently—by which they may be referred to past or future; but as imaged they *are* present, and, as we have just observed, are regarded as both actual and present in the absence of correcting impressions. We cannot at once see the sky red and blue; how is it we can imagine it the one while perceiving it to be the other? When we attempt to make the field of sight at once red and blue, as in looking through red glass with one eye and through blue glass with the other, either the colours merge and we see a purple sky or we see the sky first of the one colour and then of the other in irregular alternation. That this does not happen between impression and image shows that, whatever their connexion, images altogether are distinct from the presentation-continuum and cannot with strict propriety be spoken of as revived or reproduced impressions. This difference is manifest in another respect, *viz.*, when we compare the effects of diffusion in the two cases. An increase in the intensity of a sensation of touch entails an increase in the extensity; an increase of muscular innervation entails irradiation to adjacent muscles; but when a particular idea becomes clearer and more distinct there rises into consciousness an associated idea qualitatively related probably to impressions of quite another class, as when the smell of tar calls up memories of the sea-beach and fishing-boats. Since images are thus distinct from impressions, and yet so far continuous with each other as to form a train in itself unbroken, we should be justified, if it were convenient, in speaking of images as changes in a representation- or memory-continuum; and later on we may see that this is convenient.

Impressions, then, have no associates to whose presence their own is accommodated and on whose intensity their own depends. Each bids independently for attention, so

¹ Moreover, as we shall see, the distinction between present and past or future psychologically presupposes the contrast of impression and image.

that often a state of distraction ensues, such as the train of ideas left to itself never occasions. The better to hear we listen; the better to see we look; to smell better we dilate the nostrils and sniff; and so with all the special senses: each sensory impression sets up nascent movements for its better reception.¹ In like manner there is also an adjustment for images which can be distinguished from sensory adjustments almost as readily as these are distinguished from each other. We become most aware of this, as, *mutatis mutandis*, we do of them, when we voluntarily concentrate attention upon particular ideas instead of remaining mere passive spectators, as it were, of the general procession. To this ideational adjustment may be referred most of the strain and "head-splitting" connected with recollecting, reflecting, and all that people call head-work; and the "absent look" of one intently thinking or absorbed in reverie seems directly due to the absence of sensory adjustment that accompanies the concentration of attention upon ideas.

Con-
nexion of
impressions
and
images.

But, distinct as they are, impressions and images are still closely connected. In the first place, there are two or three well-marked intermediate stages, so that, though we cannot observe it, we seem justified in assuming a steady transition from the one to the other. As the first of such intermediate stages, it is usual to reckon what are often, and—so far as psychology goes—inaccurately, styled after-images. They would be better described as after-sensations, except perhaps when the sense of sight is specially in question, inasmuch as they are due either (1) to the persistence of the original peripheral excitation after the stimulus is withdrawn, or (2) to the effects of the exhaustion or the repair that immediately follows this excitation. In the former case they are qualitatively identical with the original sensation and are called "positive," in the latter they are complementary to it and are called "negative" (see EYE, vol. viii. p. 823). These last, then, of which we have clear instances only in connexion with sight, are obviously in no sort re-presentations of the original impression, but a sequent presentation of diametrically opposite quality; while positive after-sensations are, psychologically regarded, nothing but the original sensations in a state of evanescence. It is this continuance and gradual waning after the physical stimulus has completely ceased that give after-sensations their chief title to a place in the transition from impression to image. There is, however, another point of resemblance: after-sensations are less affected by movement. If we turn away our eyes we cease to see the flame at which we have been looking, but the after-image remains and is projected upon the wall, and continues still localized in the dark field of sight even if we close our eyes altogether. But the fact that movement affects their localization, though it does not exclude them, and the fact also that we are distinctly aware of our sense-organs being concerned in their presentation, both serve to mark them off as primary and not secondary presentations. The after-sensation is in reality more elementary than either the preceding percept or its image. In both these, in the case of sight, objects appear in space of three dimensions, *i.e.*, with all the marks of solidity and perspective;² but the so-called after-image

lacks all these. Still further removed from normal sensations (*i.e.*, sensations determined by the stimuli appropriate to the sense-organ) are the "recurrent sensations" often unnoticed but probably experienced more or less frequently by everybody—cases, that is, in which sights or sounds, usually such as at the time were engrossing and impressive, suddenly reappear several hours or even days after the physical stimuli, as well as their effects on the terminal sense-organ, seem entirely to have ceased. Thus workers with the microscope often see objects which they have examined during the day stand out clearly before them in the dark; it was indeed precisely such an experience that led the anatomist Henle first to call attention to these facts. But he and others have wrongly referred them to what he called a "sense-memory"; all that we know is against the supposition that the eye or the ear has any power to retain and reproduce percepts. "Recurrent sensations" have all the marks of percepts which after-images lack; they only differ from what are more strictly called "hallucinations" in being, as regards form and quality, exact reproductions of the original impression and in being independent of all subjective suggestion determined by emotion or mental derangement.

In what Fechner has called the "memory-after-image," or primary memory-image, as it is better termed, we have the ordinary image in its earliest form. As an instance of what is meant may be cited the familiar experience that a knock at the door, the hour struck on the clock, the face of a friend whom we have passed unnoticed, may sometimes be recognized a few moments later by means of the persisting image, although the actual impression was entirely disregarded. But the primary memory-image can always be obtained, and is obtained to most advantage, by looking intently at some object for an instant and then closing the eyes or turning them away. The object is then imaged for a moment very vividly and distinctly, and can be so recovered several times in succession by an effort of attention. Such reinstatement is materially helped by rapidly opening and closing the eyes, or by suddenly moving them in any way. In this respect a primary memory-image resembles an after-sensation, which can be repeatedly revived in this manner when it would otherwise have disappeared. But in other respects the two are very different: the after-sensation is necessarily presented if the intensity and direction of the original excitation suffice for its production, and cannot be presented, however much we attend, if they do not. Moreover, the after-sensation is only for a moment positive, and then passes into the negative or complementary phase, when, so far from even contributing towards the continuance of the original percept, it directly hinders it. Primary memory-images, on the other hand, and indeed all images, depend mainly upon the attention given to the impression; provided that was sufficient the faintest impression may be long retained, and without it very intense ones will soon leave no trace. The primary memory-image retains so much of its original definiteness and intensity as to make it possible with great accuracy to compare two physical phenomena, one of which is in this way remembered while the other is really present; for the most part this is indeed a more accurate procedure than that of dealing with both together. But this is only possible for a very short time. From Weber's experiments with weights and lines³ it would appear that even after

¹ Organic sensations, though distinguishable from images by their definite though often anatomically inaccurate localization, furnish no clear evidence of such adaptations. But in another respect they are still more clearly marked off from images, *viz.*, by the pleasure or pain they directly occasion.

² The following scant quotation from Fechner, one of the best observers in this department, must suffice in illustration. "Lying awake in the early morning after daybreak, with my eyes motionless though open, there usually appears, when I chance to close them for a moment, the black after-image of the white bed immediately before me and the white after-image of the black stove-pipe some distance away against the opposite wall. . . . Both [after-images] appear as

if they were in juxtaposition in the same plane; and, though—when my eyes are open—I seem to see the white bed in its entire length, the after-image—when my eyes are shut—presents instead only a narrow black stripe owing to the fact that the bed is seen considerably foreshortened. But the memory-image on the other hand completely reproduces the pictorial illusion as it appears when the eyes are open" (*Elemente der Psychophysik*, ii. p. 478).

³ *Die Lehre vom Tastsinne*, &c., p. 80 sq.

10 seconds a considerable waning has taken place, and after 100 seconds all that is distinctive of the primary image has probably ceased.

On the whole, then, it appears that the ordinary memory-image is a joint effect; it is not the mere residuum of changes in the presentation-continuum, but an effect of these only when there has been some concentration of attention upon them. It has the form of a percept, but is not constituted of "revived impressions," for the essential marks of impressions are absent; there is no localization or projection, neither is there the motor adaptation, nor the tone of feeling, incident to the reception of impressions. Ideas do not reproduce the intensity of these original constituents, but only their quality and complication. What we call the vividness of an idea is of the nature of intensity, but it is an intensity very partially and indirectly determined by that of the original impression; it depends much more upon the state of the memory-continuum and the attention the idea receives. The range of vividness in ideas is probably comparatively small; what are called variations in vividness are often really variations in distinctness and completeness.¹ Where we have great intensity, as in hallucinations, primary presentations may be reasonably supposed to enter into the complex.

It is manifest that the memory-continuum has been in some way formed out of or differentiated from the presentation-continuum by the movements of attention, but the precise connexion of the two continua is still very difficult to determine. We see perhaps the first distinct step of this evolution in the primary memory-image: here there has been no cessation in presentation and yet the characteristic marks of the impression are gone, so much so, indeed, that superposition without "fusion" with an exactly similar impression is possible. In this manner we seem to have several primary images in the field of consciousness together, as when we count up the strokes of the clock after it has ceased striking. But, though the image thus first arises in the field of consciousness as a sort of ἀπόρροια or emanation from the presentation-continuum, its return (at which stage it first becomes a proper re-presentation) is never determined directly and solely by a second presentation like that which first gave it being. Its "revival" is not another birth. With a second impression exactly like the first we should have assimilation or simple recognition—an identity of the indiscernible which precludes the individual distinctness required in representation. But how, then, was this distinctness in the first instance possible in the series of primary images just referred to as being due to the repetition of the same presentation? Seemingly to differences in the rest of that field of consciousness in which each in turn occurred and to some persistence of these differences. If the whole field which the second impression entered had been just like the field of the first it is hard to see what ground for distinctness there would have been. When such second impression does not occur till after the primary memory-image has ceased, a representation is still possible provided the new impression can reinstate sufficient of the mental framing of the old to give the image individual distinctness. This is really what happens in what is ordinarily called "association by similarity,"—similarity, that is, in the midst of some diversity. Our inquiry into the connexion between presentations and representations has thus brought us to the general consideration of mental association.

¹ As we have seen that there is a steady transition from percept to image, so, if space allowed, the study of hallucinations might make clear an opposite and abnormal process—the passage, that is to say, of images into percepts, for such, to all intents and purposes, are hallucinations of perception, psychologically regarded.

Mental Association and the Memory-continuum.

Only a very brief treatment of this important subject Association is permissible here, as it has already been handled at length under ASSOCIATION OF IDEAS (*q.v.*). Great confusion has been occasioned, as we have seen incidentally, by the lax use of the term "association"; this confusion has been increased by a further laxity in the use of the term "association by similarity." In so far as the similarity amounts to identity, as in assimilation, we have a process which is more fundamental than association by contiguity, but then it is not a process of association. Yet, when the reviving presentation is only partially similar to the presentation revived, the nature of the association does not appear to differ from that operative when one "contiguous" presentation revives another. In the one case we have, say, abx recalling aby and in the other abc recalling def . Now anybody who will reflect must surely see that the similarity between abx and aby , as distinct from the identity of their partial constituent ab , cannot be the means of recall; for this similarity is nothing but the state of mind—to be studied presently—which results when abx and aby , having been recalled, are in consciousness together and then compared. But, if ab , having concurred with y before and being now present in abx , again revives y , the association, so far as that goes, is manifestly one of contiguity, albeit the state of mind immediately incident as soon as the revival is complete be what Dr Bain loves to style "the flash of similarity." So far as the mere revival itself goes, there is no more similarity in this case than there is when abc revives def . For the very abc that now operates as the reviving presentation was obviously never in time contiguous with the def that is revived; if all traces of previous experiences of abc were obliterated there would be no revival. In other words, the abc now present must be "automatically associated," or, as we prefer to say, must be assimilated to those residua of abc which were "contiguous" with def , before its representation can occur. And this, and nothing more than this, we have seen, is all the "similarity" that could be at work when abx "brought up" aby .

On the whole, then, we may assume that the only principle of association we have to examine is the so-called "association by contiguity," which, as ordinarily formulated, runs:—Any presentations whatever, which are in consciousness together or in close succession, cohere in such a way that when one recurs it tends to revive the rest, such tendency increasing with the frequency of the conjunction. But such a statement is liable to all the objections already urged against what we may call atomistic psychology. Presentations do not really crowd into Mansoul by the avenues of Eyegate, Eargate, &c., there to form bonds and unions as in Bunyan's famous allegory. It has been often contended that any investigation into the nature of association must be fruitless.² But, if association is thus a first principle, it ought at least to admit of such a statement as shall remove the necessity for inquiry. So long, however, as we are asked to conceive presentations originally distinct and isolated becoming eventually linked together, we shall naturally feel the need of some explanation of the process, for neither the isolation nor the links are clear,—not the isolation, for we can only conceive two presentations separated by other presentations intervening; nor the links, unless these are also presentations, and then the difficulty recurs. But, if for contiguity we substitute continuity and regard the associated presentations as parts of a new continuum, the only important inquiry is how this new whole was first of all integrated.

² So Hume, *Treatise of Human Nature*, pt. i. § 4 (Green and Grose's ed., p. 321); also Lotze, *Metaphysik*, 1st ed., p. 526.

Forma-
tion of
memory-
con-
tinuum.

To ascertain this point we must examine each of the two leading divisions of contiguous association—that of simultaneous presentations and that of presentations occurring in close succession. The last, being the clearer, may be taken first. In a series of associated presentations, *A B C D E*, such as the movements made in writing, the words of a poem learned by heart, or the simple letters of the alphabet themselves, we find that each member recalls its successor but not its predecessor. Familiar as this fact is, it is not perhaps easy to explain it satisfactorily. Since *C* is associated both with *B* and *D*, and apparently as intimately with the one as with the other, why does it revive the later only and not the earlier? *B* recalls *C*; why does not *C* recall *B*? We have seen that any reproduction at all of *A* or *B* or *C* depends primarily upon its having been the object of special attention so as to occupy at least momentarily the focus of consciousness. Now we can in the first instance only surmise that the order in which they are reproduced is determined by the order in which they were thus attended to when first presented. The next question is whether the association of objects simultaneously presented can be resolved into an association of objects successively attended to. Whenever we try to recall a scene we saw but for a moment there are always a few traits that recur, the rest being blurred and vague, instead of the whole being revived in equal distinctness or indistinctness. On seeing the same scene a second time our attention is apt to be caught by something unnoticed before, as this has the advantage of novelty; and so on, till we have “lived ourselves into” the whole, which may then admit of simultaneous recall. Dr Bain, who is rightly held to have given the best exposition of the laws of association, admits something very like this in saying that “coexistence is an artificial growth formed from a certain peculiar class of mental successions.” But, while it is easy to think of instances in which the associated objects were attended to successively, and we are all perfectly aware that the surest—not to say the only—way to fix the association of a number of objects is by thus concentrating attention on each in turn, it seems hardly possible to mention a case in which attention to the associated objects could not have been successive. In fact, an aggregate of objects on which attention could be focused at once would be already associated.

The only case, then, that now remains to be considered is that—to take it in its simplest form—of two primary presentations *A* and *X*, parts of different special continua or distinct—i.e., non-adjacent—parts of the same, and occupying the focus of consciousness in immediate succession. This constitutes their integration; for the result of this occupation may be regarded as a new continuum in which *A* and *X* become adjacent parts. For it is characteristic of a continuum that an increase in the intensity of any part leads to the intenser presentation of adjacent parts; and in this sense *A* and *X*, which were not originally continuous, have come to be so. We have here, then, some justification for the term secondary or memory-continuum when applied to this continuous series of representations to distinguish it from the primary or presentation-continuum from which its constituents are derived. The most important peculiarity of this continuum, therefore, is that it is a series of representations integrated by means of the movements of attention out of the differentiations of the primary or presentation-continuum, or rather out of so much of these differentiations as pertain to what we know as the primary memory-image. These movements of attention, if the phrase may be allowed, come in the end to depend mainly upon interest, but at first appear to be determined entirely by

mere intensity.¹ To them it is proposed to look for that continuity which images lose in so far as they part with the local signs they had as impressions and cease to be either localized or projected. Inasmuch as it is assumed that these movements form the connexion between one representation and another in the memory-train they may be called “temporal signs.”² The evidence for their existence can be more conveniently adduced presently; it must suffice to remark here that it consists almost wholly of facts connected with voluntary attention and the voluntary control of the flow of ideas, so that temporal signs, unlike local signs, are fundamentally motor and not sensory. And, unlike impressions, representations can have each but a single sign,³ the continuum of which, in contrast to that of local signs, is not rounded and complete but continuously advancing.

But in saying this we are assuming for a moment that the memory-continuum forms a perfectly single and unbroken train. If it ever actually became so, then, in the absence of any repetition of old impressions and apart from voluntary interference with the train, consciousness, till it ceased entirely, would consist of a fixed and mechanical round of images. Some approximation to such a state is often found in uncultured persons who lead uneventful lives, and still more in idiots, who can scarcely think at all.

In actual fact, however, the memory-train is liable to change in two respects, which considerably modify its structure, viz., (1) through the evanescence of some parts, and (2) through the partial recurrence of like impressions, which produces reduplications of varying amount and extent in other parts. As regards the first, we may infer that the waning or sinking towards the threshold of consciousness which we can observe in the primary mental image continues in subconsciousness after the threshold is past. For the longer the time that elapses before their revival the fainter, the less distinct, and the less complete are the images when revived, and the more slowly they rise. All the elements of a complex are not equally revivable, as we have seen already: tastes, smells, and organic sensations, though powerful as impressions to revive other images, have little capacity for ideal reproduction themselves, while muscular movements, though perhaps of all presentations the most readily revived, do not so readily revive other presentations. Idiosyncrasies are, however, frequent; thus we find one person has an exceptional memory for sounds, another for colours, another for forms. Still it is in general true that the most intense, the most impressive, and the most interesting presentations persist the longest. But the evanescence, which is in all cases comparatively rapid at first, deepens sooner or later into real or apparent oblivion. In this manner it comes about that parts of the memory-continuum lose all distinctness of feature and, being without recognizable content,

¹ This connexion of association with continuous movements of attention makes it easier to understand the difficulty above referred to, viz. that in a series *A B C D . . . B* revives *C* but not *A*, and so on—a difficulty that the analogy of adhesiveness or links leaves unaccountable. To ignore the part played by attention in association, to represent the memory-continuum as due solely to the concurrence of presentations, is perhaps the chief defect of the associationist psychology, both English and German. Mr Spencer's endeavour to show “that psychical life is distinguished from physical life by consisting of successive changes only instead of successive and simultaneous changes” (*Principles of Psychology*, pt. iv. ch. ii., in particular pp. 403, 406) is really nothing but so much testimony to the work of attention in forming the memory-continuum, especially when, as there is good reason to do, we reject his assumption that this growing seriality is physically determined.

² A term borrowed from Lotze (*Metaphysik*, 1st ed., p. 295), but the present writer is alone responsible for the sense here given to it and the hypothesis in which it is used.

³ Apart, that is to say, of course, from the reduplications of the memory-train spoken of below.

shrivel up to a dim and meagre representation of life that has lapsed—a representation that just suffices, for example, to show us that “our earliest recollections” are not of our first experiences, or to save them from being not only isolated but discontinuous. Such discontinuity can, of course, never be absolute; we must have something represented even to mark the gap. Oblivion and the absence of all representation are thus the same, and the absence of all representation cannot psychologically constitute a break. The terms “evolution” and “involution” have in this respect been happily applied to the rising and falling of representations. When we recall a particular period of our past life or what has long ceased to be a familiar scene, events and features gradually unfold and, as it were, spread out as we keep on attending. A precisely opposite process may then be supposed to take place when they are left in undisturbed forgetfulness; with loss of distinctness in the several members of a whole or series, there is a loss of individuality and of individual differences. And such loss is not a mere latency, as some psychologists, on metaphysical grounds¹ or from a mistaken use of physical analogies, have been led to suppose. There is no real resemblance between the action, or rather inaction, of a particle obedient to the first law of motion and the persistence of a presentation,² which is not even the psychical equivalent of an atom.

More important changes are produced by the repetition of parts of the memory-train. The effect of this is not merely to prevent the evanescence of the particular image or series of images, but by partial and more or less frequent reduplications of the train upon itself to convert it into a partially new continuum, which we might perhaps call the “ideational continuum.” The reduplicated portions of the train are strengthened, while at the points of divergence it becomes comparatively weakened, and this apart from the effects of obliviscence. One who had seen the queen but once would scarcely be likely to think of her without finding the attendant circumstances recur as well; this could not happen after seeing her in a hundred different scenes. The central representation of the whole complex would have become more distinct, whereas the several diverging lines would tend to dissipate attention and, by involving opposing representations, to neutralize each other, so that probably no definite background would be reinstated. Even this central representation would be more or less generalized. It has been often remarked that one’s most familiar friends are apt to be mentally pictured less concretely and vividly than persons seen more seldom and then in similar attitudes and moods; in the former case a “generic image” has grown out of such more specific representations as the latter affords. Still further removed from memory-images are the images that result from such familiar percepts as those of horses, houses, trees, &c.

Thus as the joint effect of obliviscence and reduplication we are provided with a flow of ideas distinct from the memory-train and thereby with the material, already more or less organized, for intellectual and volitional manipulation. We do not experience this flow—save very momentarily and occasionally—altogether undisturbed; even in dreams and reverie it is continually interrupted and diverted. Nevertheless it is not difficult to ascertain that, so far as it is left to itself, it takes a very different course from that which we should have to retrace if bent on reminiscence and able to recollect perfectly. The readiness and steadiness of this flow are shown by the extremely small effort necessary in order to follow it. Nevertheless

from its very nature it is liable, though not to positive breaches of continuity from its own working, yet to occasional blocks or impediments to the smooth succession of images at points where reduplications diverge, and either permanently or at the particular time neutralize each other.³

The flow of ideas is, however, exposed to positive interruptions Conflict from two distinct sides,—by the intrusion of new presentations and of pre-voluntary interference. The only result of such interruptions senta- which we need here consider is the *conflict of presentations* that may tions. ensue. Herbart and his followers have gone so far as to elaborate a complete system of psychical statics and dynamics, based on the conception of presentations as forces and on certain more or less improbable assumptions as to the modes in which such forces interact. Since our power of attention is limited, it continually happens that attention is drawn off by new presentations at the expense of old ones. But, even if we regard this non-voluntary redistribution of attention as implying a struggle between presentations, still such conflict to secure a place in consciousness is very different from a conflict between presentations that are already there. Either may be experienced to any degree possible without the other appearing at all; as, absorbed in watching a starry sky, one might be unaware of the chilliness of the air, though recognizing at once, as soon as the cold is felt, that, so far from being incompatible, the clearness and the coldness are causally connected. This difference between a conflict of presentations to enter consciousness, if we allow for a moment the propriety of the expression, and that opposition or incompatibility of presentations which is only possible when they are in consciousness has been strangely confused by the Herbartians. In the former the intensity of the presentation is primarily alone of account; in the latter, on the contrary, quality and content are mainly concerned. Only the last requires any notice here, since such opposition arises when the ideational continuum is interrupted in the ways just mentioned, and apparently arises in no other way. Certainly there is no such opposition between primary presentations: there we have the law of incompatibility preventing the presentation of opposites with the same local sign; and their presentation with different local signs involves, on this level at all events, no conflict. But what has never been presented could hardly be represented, if the ideational process were undisturbed: even in our dreams white negroes or round squares, for instance, never appear. In fact, absurd and bizarre as dream-imagery is, it never at any moment entails overt contradictions, though contradiction may be implicit.

But between ideas and percepts actual incompatibility is frequent. In the perplexity of Isaac, *e.g.*—“The voice is Jacob’s voice, but the hands are the hands of Esau”—we have such a case in a familiar form. There is here not merely mental arrest but actual conflict: the voice perceived identifies Jacob, at the same time the hands identify Esau. The images of Esau and Jacob by themselves are different, but do not conflict; neither is there any strain, quite the contrary, in recognizing a person partly like Jacob and partly like Esau. For there is no direct incompatibility between smooth and rough, so long as one pertains only to voice and the other only to hands, but the same hands and voice cannot be both smooth and rough. Similar incompatibilities may arise without the intrusion of percepts, as when, in trying to guess a riddle or to solve a problem, or generally to eliminate intellectual differences, we have images which in themselves are only logically opposite, psychologically opposed, or in conflict, because each strives to enter the same complex. In all such conflicts alike we find, in fact, a relation of presentations the exact converse of that which constitutes similarity. In the latter we have two complete presentations, abx and aby , as similar, each including the common part ab ; in the former we have two partial presentations, x and y , as contraries, each excluding the other from the incomplete ab —And this ab , it is to be noted, is not more essential to the similarity than to the conflict. But in the one case it is a generic image (and can logically be predicated of two subjects); in the other it is a partially determined individual (and cannot be subject to opposing predicates). Except as thus supplementing ab , x and y do not conflict; black and white are not incompatible save as attributes of the same thing. The possibility of most of these conflicts—of all, indeed, that have any logical interest—lies in that reduplication of the memory-continuum which gives rise to these new complexes, generic images, or general ideas.

Having thus attempted to ascertain the formation of Imagination and memory. the ideational continuum out of the memory-train, the

¹ So, *e.g.*, Hamilton (following H. Schmid), *Lect. on Met.*, ii. p. 211 *sq.*

² Cf. Lotze, *Metaphysik*, p. 518.

³ It is a mark of the looseness of much of our psychological terminology that facts of this kind are commonly described as cases of association. Dr Bain calls them “obstructive association,” which is about on a par with “progress backwards”; Mr Sully’s “divergent association” is better. But it is plain that what we really have is an arrest or inhibition consequent on association, and nothing that is either itself association or that leads to association.

question arises: How now are we to distinguish between imagining and remembering, and again, between imagining and expecting? It is plainly absurd to make the difference depend on the presence of belief in memory and expectation and on its absence in mere imagination; for the belief itself depends on the difference instead of constituting it. One real and obvious distinction, however, which Hume pointed out as regards memory, is the fixed order and position of the ideas of what is remembered or expected as contrasted with "the liberty" of the imagination to transpose and change its ideas. This order and position in the case of memory are, of course, normally those of the original impressions, but it seems rather naive of Hume to tell us that memory "is tied down to these without any power of variation," while imagination has liberty to transpose as it pleases, as if the originals sat to memory for their portraits, while to imagination they were but studies. Such correspondence being out of the question—as Hume takes care to state as soon as it suits him—all we have, so far, is this fixity and definiteness as contrasted with the kaleidoscopic instability of ideation. In this respect what is remembered or expected resembles what is perceived: the grouping not only does not change capriciously and spontaneously, but resists any mental efforts to change it. But, provided these characteristics are there, we should be apt to believe that we are remembering, just as, *mutatis mutandis*, with like characteristics we might believe that we were perceiving: hallucination is possible in either case.

This fixity of order and position is, however, not sufficient to constitute a typical remembrance where the term is exactly used. But remembering is often regarded as equivalent to knowing and recognizing, as when on revisiting some once familiar place one remarks, "How well I remember it!" What is meant is that the place is recognized, and that its recognition awakens memories. Memory includes recognition; recognition as such does not include memory. In human consciousness, as we directly observe it, there is, perhaps, no pure recognition: here the new presentation is not only assimilated to the old, but the former framing of circumstance is reinstated, and so perforce distinguished from the present. It may be there is no warrant for supposing that such redintegration of a preceding field is ever absolutely *nil*, still we are justified in regarding it as extremely vague and meagre, both where mental evolution is but slightly advanced and where frequent repetition in varying and irrelevant circumstances has produced a blurred and neutral zone. The last is the case with a great part of our knowledge; the writer happens to know that *bos* is the Latin for "ox" and *bufo* the Latin for "toad" and may be said to remember both items of knowledge, if "remember" is only to be synonymous with "retain." But if he came across *bos* in reading he would think of an ox and nothing more; *bufo* would immediately call up not only "toad" but Virgil's *Georgics*, the only place in which he has seen the word, and which he never read but once. In the former there is so far nothing but recognition (which, however, of course rests upon retentiveness); in the latter there is also remembrance of the time and circumstances in which that piece of knowledge was acquired. Of course in so far as we are aware that we recognize we also think that remembrance is at any rate possible, since what we know we must previously have learned,—recognition excluding novelty. But the point here urged is that there is an actual remembrance only when the recognition is accompanied by a reinstatement of portions of the memory-train continuous with the previous presentation of what is now recognized. Summarily stated, we may say that between knowing and remembering on

the one hand and imagining on the other the difference primarily turns on the fixity and completeness of the grouping in the former; in the latter there is a shifting play of images more or less "generic," reminding one of "dissolving views." Hence the first two approximate in character to perception, and are rightly called recognitions. Between them, again, the difference turns primarily on the presence or absence of temporal signs. In what is remembered these are still intact enough to ensure a localization in the past of what is recognized; in what is known merely such localization is prevented, either because of the obliviscence of temporal connexions or because the reduplications of the memory-train that have consolidated the central group have entailed their suppression. There is further the difference first mentioned, which is often only a difference of degree, viz., that remembrances have more circumstantiality, so to say, than mere recognitions have: more of the collateral constituents of the original concrete field of consciousness are reinstated. But of the two characteristics of memory proper—(a) concreteness or circumstantiality, and (b) localization in the past—the latter is the more essential. It sometimes happens that we have the one with little or nothing of the other. For example, we may have but a faint and meagre representation of a scene, yet if it falls into and retains a fixed place in the memory-train we have no doubt that some such experience was once actually ours. On the other hand, as in certain so-called illusions of memory, we may suddenly find ourselves reminded by what is happening at the moment of a preceding experience exactly like it—some even feel that they know from what is thus recalled what will happen next; and yet, because we are wholly unable to assign such representation a place in the past, instead of a belief that it happened, there arises a most distressing sense of bewilderment, as if one were haunted and had lost one's personal bearings.¹ It has been held by some psychologists² that memory proper includes the representation of one's past self as agent or patient in the event or situation recalled. And this is true as regards all but the earliest human experience, at any rate; still, whereas it is easy to see that memory is essential to any development of self-consciousness, the converse is not at all clear, and would involve us in a needless circle.

Intimately connected with memory is expectation. We Expect—may as the result of reasoning conclude that a certain event will happen; we may also, in like manner, conclude that a certain other event has happened. But as we should *not* call the latter memory, so it is desirable to distinguish such indirect anticipation as the former from that expectation which is directly due to the interaction of ideas. Any man knows that he will die, and may make a variety of arrangements in anticipation of death, but he cannot with propriety be said to be expecting it unless he has actually present to his mind a series of ideas ending in that of death, such series being due to previous associations, and unless, further, this series owes its representation at this moment to the actual recurrence of some experience to which that series succeeded before. And as familiarity with an object or event in very various settings may be a bar to recollection, so it may be to expectation: the average Englishman, *e.g.*, is continually surprised without his umbrella, though only too familiar with rain, since in his climate one not specially attentive to the weather obtains no clear representation of its successive phases. But after a series of events *A B C D E . . .* has been once experienced we instinctively expect the recurrence

¹ A full discussion of these very interesting states of mind belongs to mental pathology.

² As, *e.g.*, James Mill (*Analysis of the Human Mind*, ch. x.), who treats this difficult subject with great acuteness and thoroughness.

of $BC \dots$ on the recurrence of A , *i.e.*, provided the memory-train continues so far intact. Such expectation, at first perhaps slight—a mere tendency easily overborne—becomes strengthened by every repetition of the series in the old order, till eventually, if often fulfilled and never falsified, it becomes certain and, as we commonly say, irresistible. To have a clear case of expectation, then, it is not necessary that we should distinctly remember any previous experience like it, but only that we should have actually present some earlier member of a series which has been firmly associated by such previous experiences, the remaining members, or at least the next, if they continue serial, being revived through that which is once again realized. This expectation may be instantly checked by reflexion, just as it may of course be disappointed in fact; but these are matters which do not concern the inquiry as to the nature of expectation while expectation lasts.

Present,
past,
and
future.

We shall continue this inquiry to most advantage by now widening it into an examination of the distinction of present, past, and future. To a being whose presentations never passed through the transitions which ours undergo—first divested of the strength and vividness of impressions, again reinvested with them and brought back from the faint world of ideas—the sharp contrasts of “now” and “then,” and all the manifold emotions they occasion, would be quite unknown. Even we, so far as we confine our activity and attention to ideas, are almost without them. Time-order, succession, antecedence and consequence, of course, there might be still, but in that sense of events as “past and gone for ever,” which is one of the melancholy factors in our life; and in the obligation to wait and work in hope or dread of what is “still to come” there is much more than time-order. It is to presentations in their primary stage, to impressions, that we owe what real difference we find between now and then, whether prospective or retrospective, as it is to them also that we directly owe our sense of the *real*, of what *is* and exists as opposed to the non-existent that is not. But the present alone and life in a succession of presents, or, in other words, continuous occupation with impressions, give us no knowledge of the present as present. This we first obtain when our present consciousness consists partly of memories or partly of expectations as well. An event expected differs from a like event remembered chiefly in two ways—in its relation to present impressions and images and in the active attitude to which it leads. The diverse feelings that accompany our intuitions of time and contribute so largely to their colouring are mainly consequences of these differences. Let us take a series of simple and familiar events $AB C D E$, representing ideas by small letters and perceptions by capitals whenever it is necessary to distinguish them. Such series may be present in consciousness in such wise that $abcd$ are imaged while E is perceived anew, *i.e.*, the whole symbolized as proposed would be $abcdE$; such would be, *e.g.*, the state of a dog which had just finished his daily meal. Again, there may be a fresh impression of A which revives $bcde$; we should have then (1) $Abcde$ —the state of our dog when he next day gets sight of the dish in which his food is brought to him. A little later we may have (2) $abCde$. Here ab are either after-sensations or primary memory-images, or have at any rate the increased intensity due to recent impression; but this increased intensity will be rapidly on the wane even while C lasts, and ab will pale still further when C gives place to D , and we have (3) $abcDe$. But, returning to (2), we should find de to be increasing in intensity and definiteness, as compared with their state in (1), now that C , instead of A , is the present impression. For, when A occupied this position, not only was e raised less prominently above the threshold of consciousness by reason of its greater distance from A in the

memory-continuum, but, owing to the reduplications of this continuum, more lines of possible revival were opened up, to be successively negated as B succeeded to A and C to B ; even dogs know that “there is many a slip ‘twixt the cup and the lip.” But, where $AB C D E$ is a series of percepts such as we have here supposed—and a series of simpler states would hardly afford much ground for the distinctions of past, present, and future—there would be a varying amount of active adjustment of sense-organs and other movements supplementary to full sensation. In (2), the point at which we have $abCde$, for instance, such adjustments and movements as were appropriate to b would cease as B lapsed and be replaced by those appropriate to C . Again, as C succeeded to B , and d in consequence increased in intensity and definiteness, the movements adapted to the reception of D would become nascent, and so on. Thus, psychologically regarded, the distinction of past and future and what we might call the oneness of direction of time depend, as just described, (1) upon the continuous sinking of the primary memory-images on the one side, and the continuous rising of the ordinary images on the other side, of that member of a series of percepts then repeating which is actual at the moment; and (2) on the preventient adjustments of attention, to which such words as “expect,” “await,” “anticipate,” all testify by their etymology. These conditions in turn will be found to depend upon all that is implied in the formation of the memory-train and upon that recurrence of like series of impressions which we attribute to the “uniformity of nature.” If we never had the same series of impressions twice, knowledge of time would be impossible, as indeed would knowledge of any sort.

This is perhaps the fittest point at which to inquire into the character and origin of our knowledge of succession and duration, so far, that is, as such an inquiry belongs to psychology. We have not to ask how time itself comes to be; but, assuming it to be, we ask how the individual comes to know it. Time is often figuratively represented as a line, and we may perhaps utilize this figure to make clear the relation of our intuition of time to what we call time itself. Time, then, we say, stretches backwards and forwards from the present moment. But the present, though a point of time, is still such that we can and do in that moment attend to a plurality of presentations to which we might otherwise have attended severally in successive moments. Granting this implication of simultaneity and succession, we may, if we represent succession as a line, represent simultaneity as a second line at right angles to the first; empty time—or time-length without time-breadth, we may say—is a mere abstraction. Now it is with the former line that we have to do in treating of time as it is, and with the latter in treating of our intuition of time, where, just as in a perspective representation of distance, we are confined to lines in a plane at right angles to the actual line of depth. In a succession of events, say of sense-impressions, $AB C D E \dots$ the presence of B means the absence of A and of C , but the presentation of this succession involves the simultaneous presence, in some mode or other, of two or more of the presentations $AB C D$. In presentation, as we have seen, all that corresponds to the differences of past, present, and future is in consciousness simultaneously. This truism—or paradox—that all we know of succession is but an interpretation of what is really simultaneous or co-existent, we may then concisely express by saying that we are aware of time only through time-perspective, and experience shows that it is a long step from a succession of presentations to such presentation of succession. The first condition is that we should have represented together presentations that were in the first instance attended to

successively, and this we have both in the persistence of primary memory-images and in the simultaneous reproduction of longer or shorter portions of the memory-train. In a series thus secured there may be time-marks, though no time, and by these marks the series must be distinguished from other simultaneous series. To ask which is first among a number of simultaneous presentations is unmeaning; one might be logically prior to another, but in time they are together and priority is excluded. Nevertheless after each distinct representation *a*, *b*, *c*, *d* there probably follows, as we have supposed, some trace of that movement of attention of which we are aware in passing from one presentation to another. In our present reminiscences we have, it must be allowed, little direct proof of this interposition, though there is strong indirect evidence of it in the tendency of the flow to follow the order in which the presentations were first attended to. With the movements themselves we are familiar enough, though the residua of such movements are not ordinarily conspicuous. These residua, then, are our temporal signs, and, together with the representations connected by them, constitute the memory-continuum. But temporal signs alone will not furnish all the pictorial exactness of the time-perspective. They give us only a fixed series; but the working of obliviscence, by insuring a progressive variation in intensity and distinctness as we pass from one member of the series to the other, yields the effect which we call time-distance. By themselves such variations would leave us liable to confound more vivid representations in the distance with fainter ones nearer the present, but from this mistake the temporal signs save us; and, as a matter of fact, where the memory-train is imperfect such mistakes continually occur. On the other hand, where these variations are slight and imperceptible, though the memory-continuum preserves the order of events intact, we have still no such distinct appreciation of comparative distance in time as we have nearer the present where these perspective effects are considerable.

Duration. When in retrospect we note that a particular presentation *X* has had a place in the field of consciousness, while a series of objects *A B C D . . .* have succeeded each other, then we may be said in observing this relation of the two to perceive the duration of *X*. And it is in this way that we do subjectively estimate longer periods of time. But first, it is evident that we cannot apply this method to indefinitely short periods without passing beyond the region of distinct presentation; and, since the *knowledge* of duration implies a relation between distinguishable presentations *A B C D* and *X*, the case is one in which the hypothesis of subconsciousness can hardly help any but those who confound the fact of time with the knowledge of it. Secondly, if we are to compare different durations at all, it is not enough that one of them should last out a series *A B C D*, and another a series *I M N O*; we also want some sort of common measure of those series. Locke was awake to this point, though he expresses himself vaguely (*Essay*, ii. 14, §§ 9-12). He speaks of our ideas succeeding each other "at certain distances not much unlike the images in the inside of a lantern turned round by the heat of a candle," and "guesses" that "this appearance of theirs in train varies not very much in a waking man." Now what is this "distance" that separates *A* from *B*, *B* from *C*, and so on, and what means have we of knowing that it is tolerably constant in waking life? It is probably that the residuum of which we have called a temporal sign; or, in other words, it is the movement of attention from *A* to *B*. But we must endeavour here to get a more exact notion of this movement. Everybody knows what it is to be distracted by a rapid succession of varied impressions, and equally what it is to be wearied

by the slow and monotonous recurrence of the same impressions. Now these "feelings" of distraction and tedium owe their characteristic qualities to movements of attention. In the first, attention is kept incessantly on the move: before it is accommodated to *A*, it is disturbed by the suddenness, intensity, or novelty of *B*; in the second, it is kept all but stationary by the repeated presentation of the same impression. Such excess and defect of surprises make one realize a fact which in ordinary life is so obscure as to escape notice. But recent experiments have set this fact in a more striking light, and made clear what Locke had dimly before his mind in talking of a certain distance between the presentations of a waking man. In estimating very short periods of time, of a second or less, indicated say by the beats of a metronome, it is found that there is a certain period for which the mean of a number of estimates is correct, while shorter periods are on the whole overestimated, and longer periods underestimated. This we may perhaps take to be evidence of the time occupied in accommodating or fixing attention. Whether the "point of indifference" is determined by the rate of usual bodily movement, as Spencer asserts and Wundt conjectures, or conversely, is a question we need not discuss just now. But, though the fixation of attention does of course really occupy time, it is probably not in the first instance perceived as time, *i.e.*, as continuous "protensity," to use a term of Hamilton's, but as intensity. Thus, if this supposition be true; there is an element in our concrete time-perceptions which has no place in our abstract conception of time. In time conceived as physical there is no trace of intensity; in time psychically experienced duration is primarily an intensive magnitude, witness the comparison of times when we are "bored" with others when we are amused. It must have struck every one as strange who has reflected upon it that a period of time which seems long in retrospect—such as an eventful excursion—should have appeared short in passing; while a period, on the contrary, which in memory has dwindled to a wretched span seemed everlasting till it was gone. But, if we consider that in retrospect length of time is represented primarily and chiefly by impressions that have survived, we have an explanation of one-half; and in the intensity of the movements of attention we shall perhaps find an explanation of the other. What tells in retrospect is the series *a b c d e*, &c.; what tells in the present is the intervening *t₁ t₂ t₃*, &c., or rather the original accommodation of which these temporal signs are the residuum. For, as we have seen elsewhere, the intensity of a presentation does not persist, so that in memory the residuum of the most intense feeling of tedium may only be so many *t*'s in a memory-continuum whose surviving members are few and uninteresting. But in the actual experience, say, of a wearisome sermon, when the expectation of release is continually balked and attention forced back upon a monotonous dribble of platitudes, the one impressive fact is the hearer's impatience. On the other hand, so long as we are entertained, attention is never involuntary, and there is no continually deferred expectation. Just as we are said to walk with least effort when our pace accords with the rate of swing of our legs regarded as pendulums, so in pastimes impressions succeed each other at the rate at which attention can be most easily accommodated, and are such that we attend willingly. We are absorbed in the present without being unwillingly confined to it; not only is there no motive for retrospect or expectation, but there is no feeling that the present endures. Each impression lasts as long as it is interesting, but does not continue to monopolize the focus of consciousness till attention to it is fatiguing, because uninteresting. In such facts, then, we seem to have proof that our perception of duration rests

ultimately upon quasi-motor objects of varying intensity, the duration of which we do not directly experience as duration at all. They do endure and their intensity is a function of their duration; but the intensity is all that we directly perceive. In other words, it is here contended that what Locke called an instant or moment—"the time of one idea in our minds without the succession of another, wherein therefore we perceive no succession at all"—is psychologically not "a part in duration" in that sense in which, as he says, "we cannot conceive any duration without succession" (*Essay*, ii. 16, 12).

How do we know that the distance between our ideas cannot vary beyond certain bounds? This is not altogether a psychological question; but we are perhaps entitled to note some interesting facts bearing upon it which may also serve to connect the perceptions of duration and succession. If we make a Savart's wheel with a single tooth revolve slowly, say in three-quarters of a second, it will be found that in the long-run we estimate this interval correctly,—slight overestimates and slight underestimates occurring indifferently. If we next place a second tooth opposite the first, letting the wheel revolve as before, so as to divide the three-quarters of a second into two intervals, we shall on the average overestimate it, and must increase the whole period to reach a new point of indifference. With two other teeth at right angles to the first two, the three-quarters of a second will appear longer still, and the time of a revolution must be still more increased before we shall cease to overestimate it. If we next employ, say, six teeth, 60° apart, the wheel revolving as at first, we shall detect ourselves attending to the alternate strokes, say to the first, third, and fifth, or perhaps to the third and the sixth; in this way, though we continue to overestimate the total period, we can note the number and regularity of the subdivisions. If these, however, be yet further increased, we can no longer reproduce them, though still aware that the whole period is divided into parts. But by the time we have introduced about fifteen equidistant teeth, although there is physically an alternation of noise and silence as before, we perceive only a continuous hum, which steadily changes in quality as the number of teeth is further increased. Facts like these not only show that we estimate duration primarily by the effects of attention, but also make it probable that such estimate is fairly constant, since it is always approximately the same physical interval that becomes blurred. Further, we see that, where the distance between successive presentations is too short for a separate fixation of attention upon each, we proceed to take them in groups. This procedure is facilitated by differences in the quality and intensity of the objects as well as by differences in the intervals between them; hence among other things the æsthetic properties of modulation and rhythm.

But, if our experience of time depends primarily upon acts of attention to a succession of distinct objects, it would seem that time, subjectively regarded, must be discrete and not continuous. This, which is the view steadily maintained by the psychologists of Herbart's school, was implied if not stated by Locke, Berkeley, and Hume. Locke hopelessly confuses time as perceived and time as conceived, and can only save himself from pressing objections by the retort, "It is very common to observe intelligible discourses spoiled by too much subtlety in nice divisions." But Berkeley and Hume with the mathematical discoveries of Newton and Leibnitz before them could only protest that there was nothing answering to mathematical continuity in our experience. And, whereas Locke had tried to combine with his general psychological account the inconsistent position that "none of the distinct ideas we have of either [space or time] is without all manner of composition," Berkeley declares, "For my own part, whenever I attempt to frame a simple idea of time, abstracted from the succession of ideas in my mind, which flows uniformly and is participated by all beings, I am lost and embroiled in inextricable difficulties. I have no notion of it at all, only I hear others say it is infinitely divisible, and speak of it in such a manner as leads me to harbour

odd thoughts of my existence. . . . Time therefore being nothing, abstracted from the succession of ideas in our minds, it follows that the duration of any finite spirit must be estimated by the number of ideas or actions succeeding each other in that same spirit or mind" (*Principles of Knowledge*, i. § 98). Hume, again, is at still greater pains to show that "the idea which we form of any finite quality is not infinitely divisible, but that by proper distinctions and separations we may run this idea up to inferior ones, which will be perfectly simple and indivisible . . . that the imagination reaches a *minimum*, and may raise up to itself an idea of which it cannot conceive any subdivision, and which cannot be diminished without a total annihilation" (*Human Nature*, pt. ii. § 1, Green's ed., p. 335).

At the first blush we are perhaps disposed to accept this account of our time-perception, as Wundt, *e.g.*, does, and to regard the attribution of continuity as wholly the result of after-reflexion.¹ But it may be doubted if this is really an exact analysis of the case. Granted that the impressions to which we chiefly attend are distinct and discontinuous in their occupation of the focus of consciousness, and that, so far, the most vivid element in our time-experience is discrete; granted further that in recollection and expectation such objects are still distinct—all which seems to imply that time is a mere plurality—yet there is more behind. The whole field of consciousness is not occupied by distinct objects, neither are the changes in this field discontinuous. The experimental facts above-mentioned illustrate the transition from a succession the members of which are distinctly attended to to one in which they are indistinctly attended to, *i.e.*, are not discontinuous enough to be separately distinguished. Attention does not move by hops from one definite spot to another, but, as Wundt himself allows, by alternate diffusion and concentration, like the foot of a snail, which never leaves the surface it is traversing. We have a clear presentation discerned as *A* or *B* when attention is gathered up; and, when attention spreads out, we have confused presentations not admitting of recognition. But, though not recognizable, such confused presentations are represented, and serve to bridge over the comparatively empty interval during which attention is unfocused. Thus our perception of a period of time is not comparable to so many terms in a series of finite units any more than it is to a series of infinitesimals. When attention is concentrated in expectation of some single impression, then, no doubt, it is brought to a very fine point ("zugespißt," as Herbart would say); and a succession of such impressions would be represented as relatively discrete compared with the representation of the scenery of a day-dream. But absolutely discrete it is not and cannot be. In this respect the truth is rather with Herbert Spencer, who, treating of this subject from another point of view, remarks, "When the facts are contemplated objectively, it becomes manifest that, though the changes constituting intelligence approach to a single succession, they do not absolutely form one" (*Psychology*, i. § 180, p. 403).

On the whole, then, we may conclude that our concrete time-experiences are due to the simultaneous representation of a series of definite presentations both accompanied and separated by more or fewer indefinite presentations more or less confused; that, further, the definite presentations have certain marks or temporal signs due to the movements of attention; that the rate of these movements or accommodations is approximately constant; and that each movement itself is primarily experienced as an intensity.

Feeling.

Such summary survey as these limits allow of the more elementary facts of cognition is here at an end; so far the most conspicuous factors at work have been those of what might be termed our ideational mechanism. In the higher processes of thought we have to take more account of mental activity and of the part played by language. But it seems preferable, before entering upon this, to explore also the emotional and active constituents of mind in their more elementary phases.

In our preliminary survey we have seen that psychical life consists in the main of a continuous alternation of receptive and reactive consciousness, *i.e.*, in its earliest form, of alternations of sensation and movement. At a later stage we find that in the receptive phase ideation is added to sensation, and that in the active phase thought and fancy, or the voluntary manipulation and control of the ideational trains, are added to the voluntary manipulation and control of the muscles. At this higher level also it is possible that either form of receptive consciousness may lead to either form of active sensations may lead to thought rather than to action in the restricted

¹ Comp. Wundt, *Logik*, vol. i. p. 432.

sense, and ideas apart from sensations may prompt to muscular exertion. There is a further complication still: not only may either sensations or ideas lead to either muscular or mental movements, but movements themselves, whether of mind or limb, may as mere presentations determine other movements of either kind. In this respect, however, movements and thoughts either in themselves or through their sensational and ideational accompaniments may be regarded as pertaining to the receptive side of consciousness. With these provisos, then, the broad generalization may hold that receptive states lead through feeling to active states, and that presentations that give neither pleasure nor pain meet with no responsive action. But first the objection must be met that presentations that are in themselves purely indifferent lead continually to very energetic action, often the promptest and most definite action. To this there are two answers. First, on the higher levels of psychical life presentations in themselves indifferent are often indirectly interesting as signs of, or as means to, other presentations that are more directly interesting. It is enough for the present, therefore, if it be admitted that all such indifferent presentations are without effect as often as they are *not* instrumental in furthering the realization of some desirable end. Secondly, a large class of movements, such as those called sensori-motor and ideomotor, are initiated by presentations that are frequently, it must be allowed, neither pleasurable nor painful. In all such cases, however, there is probably only an apparent exception to the principle of subjective selection. They may all be regarded as instances of another important psychological principle which we have to deal with more fully by and by, viz., that voluntary actions, and especially those that either only avert pain or are merely subsidiary to pleasure-giving actions, tend at length, as the effect of habit in the individual and of heredity in the race, to become "secondarily automatic," as it has been called. Such mechanical or instinctive dexterities make possible a more efficient use of present energies in securing pleasurable and interesting experiences, and, like the rings of former growths in a tree, afford a basis for further advance, as old interests pall and new ones present themselves. Here, again, it suffices for our present purpose if it be granted that there is a fair presumption in favour of supposing all such movements to have been originally initiated by feeling, as certainly very many of them were.

Of the feeling itself that intervenes between these sensory and motor presentations there is but little to be said. The chief points have been already insisted upon, viz., that it is not itself a presentation, but a purely subjective state, at once the effect of a change in receptive consciousness and the cause of a change in motor consciousness; hence its continual confusion either with the movements, whether ideational or muscular, that are its expression, or with the sensations or ideas that are its cause. For feeling as such is, so to put it, matter of *being* rather than of direct knowledge; and all that we know about it we know from its antecedents or consequents in presentation.

CAUSES
OF
FEELING.

Pure feeling, then, ranging solely between the opposite extremes of pleasure and pain, we are naturally led to inquire whether there is any corresponding contrast in the causes of feeling on the one hand, and on the other in its manifestations and effects. To begin with the first question, which we may thus formulate: What, if any, are the invariable differences characteristic of the presentations or states of mind we respectively like and dislike; or, taking account of the diverse sources of feeling—sensuous, æsthetic, intellectual, active—is there anything that we can predicate alike of all that are pleasurable and deny of all that are painful, and *vice versa*? It is at once evident that at least in presentations objectively regarded no such common characters will be found; if we find them anywhere it must be in some relation to the conscious subject, i.e., in the fact of presentation itself. There is one important truth concerning pleasures and pains that may occur at once as an answer to our inquiry, and that is often advanced as such, viz., that whatever is pleasurable tends to further and perfect life, and whatever is painful to disturb or destroy it. The many seeming exceptions to this law of self-conservation, as it has been called, probably all admit of explanation in conformity with it, so as to leave its substantial truth unimpeached.¹ But this law, however

stated, is too teleological to serve as a purely psychological principle, and, as generally formulated and illustrated, it takes account of matters quite outside the psychologist's ken. We are not now concerned to know *why* a bitter taste, e.g., is painful or the gratification of an appetite pleasant, but *what* marks distinctive of all painful presentations the one has and the other lacks. From a biological standpoint it may be true enough that the final cause of sexual and parental feelings is the perpetuation of the species; but this does not help us to ascertain what common character they have as actual sources of feeling for the individual. From the biological standpoint even the senile decadence and death of the individual may be shown to be advantageous to the race; but it would certainly be odd to describe this as advantageous to the individual, so different are the two points of view. What we are in search of, although a generalization, has reference to something much more concrete than conceptions like race or life, and does not require us to go beyond the consciousness of the moment to such ulterior facts as they imply.

Were it possible it would be quite unnecessary to examine in detail every variety of pleasurable and painful consciousness in connexion with a general inquiry of this sort. It will be best to enumerate at the outset the only cases that specially call for investigation. Feeling may arise mainly from (1) single sensations or movements, including in these what recent psychologists call their *tone*; or it may be chiefly determined by (2) some combination or arrangement of these primary presentations,—hence what might be styled the lower æsthetic feelings. We have thus among primary presentations a more material and a more formal cause or ground of feeling. The mere representation of these sources of feeling involves nothing of moment: the idea of a bright colour or a bitter taste has not definiteness or intensity enough to produce feeling; and the ideal presentation of a harmonious arrangement of sounds or colours does not in itself differ essentially as regards the feeling it occasions from the actual presentation. When we advance to the level at which there occur ideas more complex and more highly representative—or re-representative, as Mr Spencer would say—than any we have yet considered we can again distinguish between material and formal grounds of feeling. To the first we might refer, e.g., (3) the egoistic, sympathetic, and religious feelings; this class will probably require but brief notice. The second, consisting of (4) the intellectual and (5) the higher æsthetic feelings, is more important. There is a special class of feelings, which might be distinguished from all the preceding as *reflex*, since they arise from the memory or expectation of feelings; but in fact these are largely involved in all the higher feelings, and this brief reference to them will suffice; of such hope, fear, regret, are examples.

1. The quality and intensity as well as the duration and frequency of a sensation or movement all have to do with determining to what feeling it gives rise. It will be best to leave the last two out of account for a time. Apart from these, the pleasantness or painfulness of a movement appears to depend solely upon its intensity, that is to say, upon the amount of effort necessary to effect it, in such wise that a certain amount of exertion is agreeable and any excess disagreeable. Some sensations also, such as light and sound, are agreeable if not too intense, their pleasantness increasing with their intensity up to a certain point, on nearing which the feeling rapidly changes and becomes disagreeable or even painful. Other sensations, as bitter tastes, e.g., are naturally unpleasant, however faint,—though we must allow the possibility of an acquired liking for moderately bitter or pungent flavours. But in every case such sensations produce unmistakable

¹ See Spencer, *Data of Ethics*, chaps. i.-iv.; G. H. Schneider, *Freud und Leid des Menschengeschlechts*, chap. i.

manifestations of disgust, if at all intense. Sweet tastes, on the other hand, however intense, are pleasant to an unspoiled palate, though apt before long to become mawkish, like "sweetest honey, loathsome in his own deliciousness," as confectioners' apprentices are said soon to find. The painfulness of all painful sensations or movements increases with their intensity without any assignable maximum being reached.

A comparison of examples of this kind, which it would be tedious to describe more fully and which are indeed too familiar to need much description, seems to show (1) that, so far as feeling is determined by the intensity of a presentation, there is pleasure so long as attention can be adapted or accommodated to the presentation, and pain so soon as the intensity is too great for this; and (2) that, so far as feeling is determined by the quality of a presentation, those that are pleasurable enlarge the field of consciousness and introduce or agreeably increase in intensity certain organic sensations, while those that are painful contract the field of consciousness and introduce or disagreeably increase in intensity certain organic sensations. There are certain other hedonic effects due to quality the examination of which we must for the present defer. Meanwhile as to the first point it may be suggested, as at any rate a working hypothesis, that in itself any and every simple sensation or movement is pleasurable if there is attention forthcoming adequate to its intensity. In the earliest and simplest phases of life, in which the presentation-continuum is but little differentiated, it is reasonable to suppose that variation in the intensity of presentation preponderates over changes in the quality of presentation, and that to the same extent feeling is determined by the former and not by the latter. And, whereas this dependence on intensity is invariable, there is no ground for supposing the quality of any primary presentation, when not of excessive intensity, to be invariably disagreeable; the changes above-mentioned in the hedonic effects of bitter tastes, sweet tastes, or the like tend rather to prove the contrary. This brings us to the second point, and it requires some elucidation. We need here to call to mind the continuity of our presentations and especially the existence of a background of organic sensations or somatic consciousness, as it is variously termed. By the time that qualitatively distinct presentations have been differentiated from this common basis it becomes possible for any of these, without having the intensity requisite to affect feeling directly, to change it indirectly by means of the systemic sensations accompanying them, or, in other words, by their tone. The physiological concomitants of these changes of somatic tone are largely reflex movements or equivalents of movements, such as alterations in circulatory, respiratory, and excretory processes. Such movements are psychologically movements no longer, and are rightly regarded as pertaining wholly to the sensory division of presentations. But originally it may have been otherwise. To us now, these organic reflexes seem but part and parcel of the special sensation whose tone they form, and which they accompany even when that sensation, so far as its mere intensity goes, might be deemed indifferent. But perhaps at first the special qualities that are now throughout unpleasant may have been always presented with an excessive intensity that would be painful on this score alone, and the reflexes that at present pertain to them may then have been psychologically the expression of this pain.¹ At any rate it is manifestly unfair to refuse either

¹ In the lowly organisms that absorb food directly through the skin such bitter juices as exist naturally might at once produce very violent effects,—comparable, say, to scalding; and the reflexes then established may have been continued by natural selection so as to save from poisoning the higher organisms, whose absorbent surfaces are internal and only guarded in this way by the organ of taste. Some light is

to seek out the primitive effects of the sensations in question and allow for the workings of heredity, or to reckon this accompanying systemic feeling as part of them. The latter seems the readier and perhaps, too, the preferable course. A word will now suffice to explain what is meant by enlarging and contracting the field of consciousness and agreeably increasing or decreasing certain elements therein.

The difference in point is manifest on comparing the flow of spirits, buoyancy, and animation which result from a certain duration of pleasurable sensations with the lowness or depression of spirits, the gloom and heaviness of heart, apt to ensue from prolonged physical pain. Common language, in fact, leaves us no choice but to describe these contrasted states by figures which clearly imply that they differ in the range and variety of the presentations that make up consciousness, and in the quickness with which these succeed each other.² It is not merely that in hilarity as contrasted with dejection the train of ideas takes a wider sweep and shows greater liveliness, but as it were at the back of this, on the lower level of purely sensory experience, certain organic sensations which are ordinarily indifferent acquire a gentle intensity, which seems by flowing over to quicken and expand the ideational stream, as we see, for instance, in the effects of mountain air and sunshine. Or, on the other hand, these sensations become so violently intense as to drain off and engulf all available energy in one monotonous corroding care, an oppressive weight which leaves no place for free movement, no life or leisure to respond to what are wont to be pleasurable solicitations.³

As regards the duration and the frequency of presentation, it is in general true that the hedonic effect soon attains its maximum, and then, if pleasant, rapidly declines, or even changes to its opposite. Pains in like manner decline, but more slowly, and without in the same sense changing to pleasures. The like holds of too frequent repetition. Physiological explanation of these facts, good as far as it goes, is, of course, at once forthcoming: sensibility is blunted, time is required for restoration, and so forth; but at least we want the psychological equivalent of all this. In one respect we find nothing materially new; so far as continued presentation entails diminished intensity we have nothing but diminished feeling as a consequence; so far as its continued presentation entails satiety the train of agreeable accompaniments ceases in which the pleasurable tone consisted. But in another way long duration and frequent repetition produce indirectly certain charac-

thrown on questions of this kind by the very interesting experiments of Dr. Romaines; for a general account of these see his *Jelly-fish, Star-fish, and Sea-urchins*, chap. ix.

² This is one among many cases in which the study of a vocabulary is full of instruction to the psychologist. The reader who will be at the trouble to compare the parallel columns under the heading "Passive Affections," in Roget's *Thesaurus of English Words and Phrases*, will find ample proof both of this general statement and of what is said above in the text.

³ Observation and experiment show that the physical signs of pain in the higher animals consist in such changes as a lowered and weaker pulse, reduction of the surface temperature, quickened respiration, dilatation of the iris, and the like. And so far as can be ascertained these effects are not altogether the emotional reaction to pain but in large measure its actual accompaniments, the physical side of what we have called its *tone*. The following is a good description of these general characteristics of feeling:—"En même temps, il se fait une série de mouvements généraux de flexion, comme si l'animal voulait se rendre plus petit, et offrir moins de surface à la douleur. Il est intéressant de remarquer que, pour l'homme comme pour tous les animaux, on retrouve ces mêmes mouvements généraux de flexion et d'extension répondant aux sentiments différents de plaisir et de la douleur. Le plaisir répond à un mouvement d'épanouissement, de dilatation, d'extension. Au contraire, dans la douleur, on se rapetisse, on se referme sur soi; c'est un mouvement général de flexion" (C. Richet, *L'Homme et l'Intelligence: La Douleur*, p. 9).

teristic effects on feeling in consequence of habituation and accommodation. We may get used to a painful presentation in such wise that we cease to be conscious of it as positively disagreeable, though its cessation is at once a source of pleasure; in like manner we come to require things simply because it is painful to be without them, although their possession has long ceased to be a ground of positive enjoyment. This loss (or gain) consequent on accommodation¹ has a most important effect in changing the sources of feeling: it helps to transfer attention from mere sensations to what we may distinguish as interests.

Combinations of sensations and of movements.

2. Certain sensations or movements not separately unpleasant become so when presented together or in immediate succession; and contrariwise, some combinations of sensations or of movements may be such as to afford pleasure distinct from, and often greater than, any that they separately yield. Here again we find that in some cases the effect seems mainly to depend on intensity, in others mainly on quality. (i.) As instances of the former may be mentioned the pleasurable of a rhythmic succession of sounds or movements, of symmetrical forms and curved outlines, of gentle crescendos and diminuendos in sound, and of gradual variations of shade in colour, and the painfulness of flickering lights, "beats" in musical notes, false time, false steps, false quantities, and the like. In all these, whenever the result is pleasurable, attention can be readily accommodated,—is, so to say, economically meted out; and, whenever the result is painful, attention is surprised, balked, wasted. Thus we can make more movements and with less expenditure of energy when they are rhythmic than when they are not, as the performances of a ball-room or of troops marching to music amply testify. Of this economy we have also a striking proof in the ease with which rhythmic language is retained. (ii.) As instances of the latter may be cited those arrangements of musical tones and of colours that are called harmonious or the opposite. Harmony, however, must be taken to have a different meaning in the two cases. When two or three tones harmonize there results, as is well known, a distinct pleasure over and above any pleasure due to the tones themselves. On the other hand, tones that are discordant are unpleasant in spite of any pleasantness they may have singly. Besides the negative condition of absence of beats, a musical interval to be pleasant must fulfil certain positive conditions, sufficiently expressed for our purpose by saying that two tones are pleasant when they give rise to few combination-tones, and when among these there are several that coincide, and that they are unpleasant when they give rise to many combination-tones, and when among these there are few or none that coincide. Too many tones together prevent any from being distinct. But where tones coincide the number of tones actually present is less than the number of possible tones, and there is a proportionate simplification, so to put it: more is commanded and with less effort. A recent writer² on harmony, in fact, compares the confusion of a discord to that of "trying to reckon up a sum in one's head and failing because the numbers are too high." A different explanation must be given of the so-called harmonies of colour. The pleasurable effect of graduations of colour or shade—to which, as Ruskin tells us, the rose owes its victorious beauty when compared with other flowers—has been already mentioned: it is rather a quantitative than a qualitative effect. What we are now concerned with are the pleasurable or

painful combinations of different ungraduated colours. A comparison of these seems to justify the general statement that those colours yield good combinations that are far apart in the colour circle, while those near together are apt to be discordant. The explanation given, viz., that the one arrangement secures and the other prevents perfect retinal activity, seems on the whole satisfactory,—especially if we acknowledge the tendency of all recent investigations and distinguish sensibility to colour and sensibility to mere light as both psychologically and physiologically two separate facts. Thus, when red and green are juxtaposed, the red increases the saturation of the green and the green that of the red, so that both colours are heightened in brilliance. But such an effect is only pleasing to the child and the savage; for civilized men the contrast is excessive, and colours less completely opposed, as red and blue, are preferred, each being a rest from the other, so that as the eye wanders to and fro over their border different elements are active by turns. Red and orange, again, are bad, in that both exhaust in a similar manner and leave the remaining factors out of play.

3. The more or less spontaneous workings of imagination, as well as that direct control of this working necessary to thinking in the stricter sense, are always productive of pain or pleasure in varying degrees. Though the exposition of the higher intellectual processes has not yet been reached, there will be no inconvenience in at once taking account of their effects on feeling, since these are fairly obvious and largely independent of any analysis of the processes themselves. It will also be convenient to include under the one term "intellectual feelings," not only the feelings connected with certainty, doubt, perplexity, comprehension, and so forth, but also what the Herbartian psychologists—whose work in this department of psychology is classical—have called *par excellence* the formal feelings,—that is to say, feelings which they regard as entirely determined by the form of the flow of ideas, and not by the ideas themselves. Thus, be the ideas what they may, when their onward movement is checked by divergent or obstructing lines of association, and especially when in this manner we are hindered, say, from recollecting a name or a quotation (as if, e.g., the names of Archimedes, Anaximenes, and Anaximander each arrested the clear revival of the other), we are conscious of a certain strain and oppressiveness, which give way to momentary relief when at length what is wanted rises into distinct consciousness and our ideas resume their flow. Here again, too, as in muscular movements, we have the contrast of exertion and facility, when "thoughts refuse to flow" and we work "invita Minerva," or when the appropriate ideas seem to unfold and display themselves before us like a vision before one inspired. To be confronted with propositions we cannot reconcile—i.e., with what is or appears inconsistent, false, contradictory—is apt to be painful; the recognition of truth or logical coherence, on the other hand, is pleasurable. The feeling in either case is, no doubt, greater the greater our interest in the subject-matter; but the mere conflict of ideas as such is in itself depressing, and the discernment of agreement, of the one in the many, in like manner a distinct satisfaction. Now in the one case we are conscious of futile efforts to comprehend as one ideas which the more distinctly we apprehend them for the purpose only prove to be the more completely and diametrically opposed; we can only affirm and mentally envisage the one by denying and suppressing the representation of the other, and yet we have to strive to predicate both and to embody them together in the same mental image. Attention is like a house divided against itself: there is effort but it is not effective, for the field of consciousness is narrowed and the flow of ideas

¹ It has been definitely formulated, but in physiological language, by Dr Bain as the Law of Novelty: "No second occurrence of any great shock or stimulus, whether pleasure, pain, or mere excitement, is ever fully equal to the first, notwithstanding that full time has been given for the nerves to recover from their exhaustion" (*Mind and Body*, p. 51). Comp. also his *Emotions and Will*, 3d ed., p. 83.

² Preyer, *Akustische Untersuchungen*, p. 59.

arrested. When, on the other hand, we discern a common principle among diverse and apparently disconnected particulars, instead of all the attention we can command being taxed in the separate apprehension of these "disjecta membra," they become as one, and we seem at once to have at our disposal resources for the command of an enlarged field and the detection of new resemblances.

Higher
æsthetic
feelings.

4. Closely related to these formal intellectual feelings are certain of the higher æsthetic feelings. A reference to some of the commonplaces of æsthetical writers may be sufficient briefly to exhibit the leading characteristics of these feelings. There is a wide agreement among men in general as to what is beautiful and what is not, and it is the business of a treatise on empirical æsthetics from an analysis of these matters of fact to generalize the principles of taste,—to do, in fact, for one source of pleasure and pain what we are here attempting in a meagre fashion for all. And these principles are the more important in their bearing upon the larger psychological question, because among æsthetic effects are reckoned only such as are pleasing or otherwise in themselves, apart from all recognition of utility, of possession, or of ulterior gratification of any kind whatever. Thus, if it should be objected that the intellectual satisfaction of consistency is really due to its utility, to the fact that what is incompatible and incomprehensible is of no avail for practical guidance, at least this objection will not hold against the æsthetic principle of *unity in variety*. In accordance with this primary maxim of art criticism, at the one extreme art productions are condemned for monotony, as incapable of sustaining interest because "empty," "bald," and "poor"; at the other extreme they are condemned as too incoherent and disconnected to furnish a centre of interest. And those are held as so far praiseworthy in which a variety of elements, be they movements, forms, colours, or incidents, instead of conflicting, all unite to enhance each other and to form not merely a mass but a whole. Another principle that serves to throw light on our inquiry is that which has been called the principle of *economy*,¹ viz., that an effect is pleasing in proportion as it is attained by little effort and simple means. The brothers Weber in their classic work on human locomotion discovered that those movements that are æsthetically beautiful are also physiologically correct; grace and ease, in fact, are wellnigh synonymous, as Herbert Spencer points out, and illustrates by apt instances of graceful attitudes, motions, and forms. The same writer,² again, in seeking for a more general law underlying the current maxims of writers on composition and rhetoric is led to a special formulation of this principle as applied to style, viz., that "economy of the recipient's attention is the secret of effect."

Perhaps of all æsthetical principles the most wide-reaching, as well as practically the most important, is that which explains æsthetic effects by association. Thus, to take one example where so many are possible, the croaking of frogs and the monotonous ditty of the cuckoo owe their pleasantness, not directly to what they are in themselves, but entirely to their intimate association with spring-time and its gladness. At first it might seem, therefore, that there is nothing fresh in this principle relevant to our present inquiry, since a pleasure that is only due to association at once carries back the question to its sources, so that in asking why the spring, for example, is pleasant we should be returning to old ground. But this is not altogether true; æsthetic effects call up not

merely ideas but ideals. A great work of art improves upon the real in two respects: it intensifies and it transfigures. It is for art to gather into one focus, cleared from dross and commonplace, the genial memories of a lifetime, the instinctive memories of a race; and, where theory can only classify and arrange what it receives, art—in a measure free from "the literal unities of time and place"—creates and glorifies. Still art eschews the abstract and speculative; however plastic in its hands, the material wrought is always that of sense. We have already noticed more than once the power which primary presentations have to sustain vivid re-presentations, and the bearing of this on the æsthetic effects of works of art must be straightway obvious. The notes and colours, rhymes and rhythms, forms and movements, which produce the lower æsthetic feelings also serve as the means of bringing into view, and maintaining at a higher level of vividness, a wider range and flow of pleasing ideas than we can ordinarily command.

5. When we reach the level at which there is distinct self-consciousness (comp. p. 84), we have an important class of feelings determined by the relation of the presentation of self to the other contents of consciousness. And as the knowledge of other selves advances *pari passu* with that of one's own self, so along with the egoistic feelings appear certain social or altruistic feelings. The two have much in common; in pride and shame, for example, account is taken of the estimate other persons form of us and of our regard for them; while, on the other hand, when we admire or despise, congratulate or pity another, we have always present to our mind a more or less definite conception of self in like circumstances. It will therefore amply serve all the ends of our present inquiry if we briefly survey the leading characteristics of some contrasted egoistic feelings, such as self-complacency and disappointment. When a man is pleased with himself, his achievements, possessions, or circumstances, such pleasure is the result of a comparison of his present position in this respect with some former position or with the position of some one else. Without descending to details, we may say that two prospects are before him, and the larger and fairer is recognized as his own. Under disappointment or reverse the same two pictures may be present to his mind, but accompanied by the certainty that the better is not his or is his no more. So far, then, it might be said that the contents of his consciousness are in each case the same, the whole difference lying in the different relationship to self. But this makes all the difference even to the contents of his consciousness, as we shall at once see if we consider its active side. Even the idlest and most thoughtless mind teems with intentions and expectations, and in its prosperity, like the fool in the parable, thinks to pull down its barns and build greater, to take its ease, eat, drink, and be merry. The support of all this pleasing show and these far-reaching aims is, not the bare knowledge of what abundance will do, but the reflexion—These many goods are mine. In mind alone final causes have a place, and the end can produce the beginning; the prospect of a summer makes the present into spring. But action is paralysed or impossible when the means evade us—

"Now drops at once the pride of awful state,
The golden canopy, the glittering plate,"

and a bleak and wintry barrenness is filled with the emptiness of despair. In so far as a man's life consists in the abundance of the things he possesseth, we see then why it dwindles with these. The like holds where self-complacency or dispendency rests on a sense of personal worth or on the honour or affection of others.

Summary and result.

We are now at the end of our survey of certain typical pleasurable and painful states. The answer to our inquiry which it seems to suggest is that there is pleasure in proportion as a maximum of attention is effectively exercised, and pain in proportion as such effective attention is frustrated by distractions, shocks, or incomplete and faulty adaptations, or fails of exercise, owing to the narrowness of the field of consciousness and the slowness and smallness of its changes. Something must be said in explication of this formula, and certain objections that might be made to it must be considered. First of all, it implies that feeling is determined partly by quantitative, or, as we might say, material, conditions, and partly by conditions that are formal or qualitative. As regards the former, both the intensity or concentration of attention and its diffusion or the extent of the field of consciousness have to be taken into account. Attention, whatever else it is, is a limited quantity—

Pluribus intentus minor est ad singula sensus—

to quote Hamilton's pet adage. Moreover, as we have seen, attention requires time. If, then, attention be distributed over too wide a field, there is a corresponding loss of intensity, and so of distinctness: we tend towards a succession of indistinguishables—indistinguishable, therefore, from no succession. We must not have more presentations in the field of consciousness than will allow of some concentration of attention: a maximum diffusion will not do. A maximum concentration, in like manner—even if there were no other objection to it—would seem to conflict with the general conditions of consciousness, inasmuch as a single simple presentation, however intense, would admit of no differentiation, and any complex presentation is in some sort a plurality. The most effective attention, then, as regards its quantitative conditions, must lie somewhere between the two zeros of complete indifference and complete absorption. If there be an excess of diffusion, effective attention will increase up to a certain point as concentration increases, but beyond that point will decrease if this intensification continues to increase; and *vice versa*, if there be an excess of concentration. But, inasmuch as these quantitative conditions involve a plurality of distinguishable presentations or changes in consciousness, the way is open for formal conditions as well. Since different presentations consort differently when above the threshold of consciousness together, one field may be wider and yet as intense as another, or intenser and yet as wide, owing to a more advantageous arrangement of its constituents.¹

Negative pleasures.

The doctrine here developed, viz., that feeling depends on efficiency, is in the main as old as Aristotle; all that has been done is to give it a more accurately psychological expression, and to free it from the implications of the faculty theory, in which form it was expounded by Hamilton. Of possible objections there are at least two that we must anticipate, and the consideration of which will

¹ As it is impossible to say that any distinguishable presentation is absolutely simple, the hypothesis of subconscientness would leave us free to assume that any pleasantness or unpleasantness that cannot be explained on the score of intensity is due to some obscure harmony or discord, compatibility or incompatibility, of elements not separately discernible. But this, though tempting, is not really a very scientific procedure. If a particular presentation is pleasurable or painful in such wise as to lead to a redistribution of attention, it is reasonable to look for an explanation primarily in its connexion with the rest of the field of consciousness. Moreover, it is obvious—since what takes place in subconscientness can only be explained in analogy with what takes place in consciousness—that, if we have an inexplicable in the one, we must have a corresponding inexplicable in the other. If the feeling produced by what comports itself as a simple presentation cannot be explained by what is in consciousness, we should be forced to admit that some presentations are unpleasant simply because they are unpleasant—an inexplicability which the hypothesis of subconscientness might push farther back but would not remove.

help to make the general view clearer. First, it may be urged that, according to this view, it ought to be one continuous pain to fall asleep, since in this state consciousness is rapidly restricted both as to intensity and range. This statement is entirely true as regards the intensity and substantially true as regards the range, at least of the higher conscientness: certain massive and agreeable organic sensations pertain to falling asleep, but the variety of presentations at all events grows less. But then the capacity to attend is also rapidly declining: even a slight intruding sensation entails an acute sense of strain in one sense, in place of the massive pleasure of repose throughout; and any voluntary concentration either in order to move or to think involves a like organic conflict, futile effort, and arrest of balmy ease. There is as regards the more definite constituents of the field of conscientness a close resemblance between natural sleepiness and the state of monotonous humdrum we call tedium or ennui; and yet the very same excitement that would relieve the one by dissipating the weariness of inaction would disturb the other by renewing the weariness of action: the one is commensurate with the resources of the moment, the other is not. Thus the maximum of effective attention in question is, as Aristotle would say, a maximum "relative to us." It is possible, therefore, that a change from a wider to a narrower field of conscientness may be a pleasurable change, if attention is more effectively engaged. Strictly speaking, however, the so-called negative pleasures of rest do not consist in a mere narrowing of the field of conscientness so much as in a change in the amount of concentration. Massive organic sensations connected with restoration take the place of the comparatively acute sensations of jaded powers forced to work. We have, then, in all cases to bear in mind this subjective relativity of all pleasurable or painful states of conscientness.

But there is still another and more serious difficulty to face. It has long been a burning question with theoretical moralists whether pleasures differ only quantitatively or differ qualitatively as well, whether psychological analysis will justify the common distinction of higher and lower pleasures or force us to recognize nothing but differences of degree, of duration, and so forth,—as expounded, *e.g.*, by Bentham, whose cynical *mot*, "Pushpin is as good as poetry provided it be as pleasant," was long a stumbling-block in the way of utilitarianism. The entire issue here is confused by an ambiguity in terms that has been already noticed: pleasure and pleasures have not the same connotation. By *a* pleasure or pleasures we mean some assignable presentation or presentations which are pleasant,—*i.e.*, afford pleasure; by pleasure simply is meant this subjective state of feeling itself. The former, like other objects of knowledge, admit of classification and comparison: we may distinguish them as coarse or as noble, or, if we will, as cheap and wholesome. But, while the *causes* of feeling are manifold, the feeling itself is a subjective state, varying only in intensity and duration. The best evidence of this lies in the general character of the actions that ensue through feeling,—the matter which has next to engage us. Whatever be the variety in the sources of pleasure, whatever be the moral or conventional estimate of their worthiness, if a given state of conscientness is pleasant we seek to retain it, if painful to be rid of it: we prefer greater pleasure before less, less pain before greater. This is, in fact, the whole meaning of preference as a psychological term. Wisdom and folly prefer each the course which the other rejects. Both courses cannot, indeed, be objectively preferable; that, however, is not a matter for psychology. But, as soon as reflexion begins, exceptions to this primary principle of action seem to arise continually, even though we regard the individual as a law to himself. Such excep-

tions, however, we may presently find to be apparent only. At any rate the principle is obviously true before reflexion begins,—true so long as we are dealing with actually present sources of feeling, and not with their re-presentations. But to admit this is psychologically to admit everything, at least if mind is to be genetically explained. Assuming, then, that we start with only quantitative variations of feeling, we have to attempt to explain the development of formal and qualitative differences in the grounds of feeling. But, if aversions and pursuits result from incommensurable states of pain and pleasure, there seems no other way of saving the unity and continuity of the subject except by a speculative assumption,—the doctrine known as the freedom of the will. The one position involves the other, and the more scientific course is to avoid both as far as we can.

The question, then, is: How, if action depends in the last resort on a merely quantitative difference, could it ever come about that what we call the higher sources of feeling should supersede the lower? If it is only quantity that turns the scales, where does quality come in, for we cannot say, *e.g.*, that the astronomer experiences a greater thrill of delight when a new planet rewards his search than the hungry savage in finding a clump of pig-nuts? *Tempora mutantur, nos et mutamur in illis* contains the answer in brief. We shall understand this answer better if we look at a parallel case, or what is really our own from another point of view. We distinguish between higher and lower forms of life: we might say there is more life in a large oyster than in a small one, other things being equal, but we should regard a crab as possessing not necessarily more life—as measured by waste of tissue—but certainly as manifesting life in a higher form. How, in the evolution of the animal kingdom, do we suppose this advance to have been made? The tendency at any one moment is simply towards more life, simply growth; but this process of self-preservation imperceptibly but steadily modifies the self that is preserved. The creature is bent only on filling its skin; but in doing this as easily as may be it gets a better skin to fill, and accordingly seeks to fill it differently. Though cabbage and honey are what they were before, they have changed relatively to the grub now it has become a butterfly. So, while we are all along preferring a more pleasurable state of consciousness before a less, the content of our consciousness is continually changing; the greater pleasure still outweighs the less, but the pleasures to be weighed are either wholly different, or at least are the same for us no more. What we require, then, is not that the higher pleasures shall always afford greater pleasure than the lower did, but that to advance to the level of life on which pleasure is derived from higher objects shall on the whole be more pleasurable and less painful than to remain behind. And this condition seems provided in the fact of accommodation above referred to (p. 69) and in the important fact that attention can be more effectively expended by what we may therefore call improvements in the form of the field of consciousness. But when all is said and done a certain repugnance is apt to arise against any association of the differences between the higher and lower feelings with differences of quantity. Yet such repugnance is but another outcome of the common mistake of supposing that the real is obtained by pulling to pieces rather than by building up.

“Do not all charms fly
At the mere touch of cold philosophy?”

But no logical analysis—nay, further, no logical synthesis—is adequate to the fulness of things. For the rest, such aversion is wholly emotional, and has no more an intel-

lectual element in it than has the disgust we feel on first witnessing anatomical dissections.¹

Emotional and Conative Action.

We turn now from the causes of feeling to its manifestations or effects, and have here in like manner to inquire whether there is in these also any contrast corresponding to the opposing extremes of pleasure and pain. We have already seen reasons for dismissing reflex movements or movements not determined by feeling as psychologically secondary, the effects of habit and heredity, and for regarding those diffusive movements that are immediately expressive of feeling as primordial,—such movements as are strictly purposive being gradually selected or elaborated from them. But some distinction is called for among the various movements expressive of emotion; for there is more in these than the direct effect of feeling regarded as merely pleasure or pain. It has been usual with psychologists to confound emotions with feeling, because intense feeling is essential to emotion. But, strictly speaking, a state of emotion is a complete state of mind, a psychosis, and not a psychical element, if we may so say. Thus in anger we have over and above pain a more or less definite object as its cause, and a certain characteristic reactive display—frowns, compressed lips, erect head, clenched fists, in a word, the combative attitude—as its effect, and similarly of other emotions; so that generally in the particular movements indicative of particular emotions the primary and primitive effects of feeling are overlaid by what Darwin has called serviceable associated habits. The purposive actions of an earlier stage of development become, though somewhat atrophied as it were, the emotive outlet of a later stage: in the circumstances in which our ancestors worried their enemies we only show our teeth. We must, therefore, leave aside the more complex emotional manifestations and look only to the simplest effects of pleasure and of pain, if we are to discover any fundamental contrast between them.²

Joy finds expression in dancing, clapping the hands, Emotional and meaningless laughter, and these actions are not only pleasurable in themselves but such as increase the existing pleasure. Attention is not drafted off or diverted; but rather the available resources seem reinforced, so that the old expenditure is supported as well as the new. To the pleasure on the receptive side is added pleasure on the active side. The violent contortions due to pain, on the other hand, are painful in themselves, though less intense than the pains from which they withdraw attention: they are but counter-irritants that arrest or inhibit still more painful thoughts or sensations. Thus, according to Darwin, “sailors who are going to be flogged sometimes take a piece of lead into their mouths in order to bite it with their utmost force, and thus to bear the pain.” When in this way we take account of the immediate effects as well

¹ “To look at anything in its elements makes it appear inferior to what it seems as a whole. Resolve the statue or the building into stone and the laws of proportion, and no worthy causes of the former beautiful result seem now left behind. So, also, resolve a virtuous act into the passions and some quantitative law, and it seems to be rather destroyed than analysed, though after all what was there else it could be resolved into?” Sir A. Grant, *Aristotle's Ethics*, Essay IV., “The Doctrine of the Mean,” vol. I. p. 210 (2d ed.).

² Of the three principles Darwin advances in explanation of emotional expression that which he places last—perhaps because it admits of less definite illustration—seems both psychologically and physiologically more fundamental than the more striking principle of serviceable associated habits which he places first; indeed the following, which is his statement of it, implies as much: “Certain actions which we recognize as expressive of certain states of mind are the direct result of the constitution of the nervous system, and have been from the first independent of the will, and to a large extent of habit” (*Expression of the Emotions*, p. 66). It is in illustration of this principle too that Darwin describes the movements expressive of joy and grief, emotions which in some form or other are surely the most primitive of any.

as of the causes of feeling, we find it still more strikingly true that only in pleasurable states is there an efficient expenditure of attention. It is needless now to dwell upon this point, although any earlier mention of it would hardly have been in place. But we should fail to realize the contrast between the motor effects of pleasure and of pain if we merely regarded them as cases of diffusion. The intenser the feeling the intenser the reaction, no doubt, whether it be smiles or tears, jumping for joy, or writhing in agony; but in the movements consequent on pleasure the diffusion is the result of mere exuberance, an overflow of good spirits, as we sometimes say, and these movements, as already remarked, are always comparatively purposeless or playful. Even the earliest expressions of pain, on the contrary, seem but so many efforts to escape from the cause of it; in them there is at least the blind purpose to flee from a definite ill, but in pleasure only the enjoyment of present fortune.

From Plato downwards psychologists and moralists have been fond of discussing the relation of pleasure and pain. It has been maintained that pain is the first and more fundamental fact, and pleasure nothing but relief from pain; and, again, on the other side, that pleasure is prior and positive, and pain only the negation of pleasure. So far as the mere change goes, it is obviously true that the diminution of pain is *pro tanto* pleasant, and the diminution of pleasure *pro tanto* unpleasant; and if relativity had the unlimited range sometimes assigned to it this would be all we could say. But we must sooner or later recognize the existence of a comparatively fixed neutral state, deviations from which, of comparatively short duration and of sufficient intensity, constitute distinct states of pleasure or pain. Such states, if not of liminal intensity, may then be further diminished without reversing their pleasurable or painful character. The turning-point here implied may, of course, gradually change too,—as a result, in fact, of the law of accommodation. Thus a long run of pleasure would raise “the hedonistic zero,” while—to the small extent to which accommodation to pain is possible—a continuance of pain would lower it. But such admission makes no material difference where the actual feeling of the moment is alone concerned and retrospect out of the question. On the whole it seems, therefore, most reasonable to regard pleasure and pain as emerging out of a neutral state, which is prior to and distinct from both,—not a state of absolute indifference, but of simple contentment, marked by no special active display. But it is by reference to such state of equilibrium or *ἀναθία* that we see most clearly the superior volitional efficacy of pain upon which pessimists love to descant. “Nobody,” says Von Hartmann, “who had to choose between no taste at all for ten minutes or five minutes of a pleasant taste and then five minutes of an unpleasant taste, would prefer the last.” Most men and all the lower animals are content “to let well alone.”

Pur-
positive
action.

To ascertain the origin and progress of purposive action it seems, then, that we must look to the effects of pain rather than to those of pleasure. Necessity is the mother of invention, and all things are full of labour. It is true that psychologists not unfrequently describe the earliest purposive movements as appetitive; or at least they treat appetitive and aversive movements as co-ordinate and equally primitive, pleasures being supposed to lead to actions for their continuance as much as pains to actions for their removal. No doubt, as soon as the connexion between a pleasurable sensation and the appropriate action is completely established, as in the case of imbibing food, the whole process is then self-sustaining till satiety begins. But the point is that such facility was first acquired under the teaching of pain,—the pain of unsatisfied hunger. The term “appetite” is apt both by its etymology and its later associations to be misleading. What are properly called the “instinctive” appetites are—when regarded from their active side—movements determined by some existing uneasy sensation. So far as their earliest manifestation in a particular individual is concerned, this urgency seems almost entirely of the nature of a *vis a tergo*; and the movements are only more definite than those simply expressive of pain because of inherited pre-adaptation, on which account, of course, they are called “instinctive.” But what one inherits another must have acquired, and

we have agreed here to leave heredity on one side and consider only the original evolution.

But if none but psychological causes were at work this evolution would be very long and in its early stages very uncertain. At first, when only random movements ensue, we may fairly suppose both that the chance of at once making a happy hit would be small and that the number of chances, the space for repentance, would also be small. Under such circumstances natural selection would have to do almost everything and subjective selection almost nothing. So far as natural selection worked, we should have, not the individual subject making a series of tries and perfecting itself by practice, as in learning to dance or swim, but we should have those individuals whose stuff or structure happened to vary for the better surviving, increasing, and displacing the rest. How much natural selection, apparently unaided, can accomplish in the way of complicated adjustment we see in the adaptation of the form and colour of plants and animals to their environment. Both factors, in reality, operate at once, and it would be hard to fix a limit to either, though to our minds natural selection seems to lose in comparative importance as we advance towards the higher stages of life.

But psychologically we have primarily to consider subjective selection, *i.e.*, first of all, the association of particular movements with particular sensations through the mediation of feeling. The sensations here concerned are mainly painful excitations from the environment, the recurring pains of innutrition, weariness, &c., and pleasurable sensations due to the satisfaction of these organic wants—pleasures which, although not a mere “filling up,” as Plato at one time contended, are still preceded by pain, but imply over and above the removal of this a certain surplus of positive good. There seem only a few points to notice. (a) When the movements that ensue through pleasure are themselves pleasurable there is ordinarily no ground for singling out any one; such movements simply enhance the general enjoyment, which is complete in itself and so far contains no hint of anything beyond. (b) Should one of these spontaneous movements of pleasure chance to cause pain, no doubt such movement is speedily arrested. Probably the most immediate connexion possible between feeling and purposive action is that in which a painful movement leads through pain to its own suppression. But such connexion is not very fruitful of consequences, inasmuch as it only secures what we may call internal training and does little to extend the relation of the individual to its environment. (c) Out of the irregular, often conflicting movements which indirectly relieve pain some one may chance to remove the cause of it altogether. Upon this movement, the last of a tentative series, attention, released from the pain, is concentrated; and in this way the evil and the remedy become so far associated that on a recurrence of the former the many diffused movements become less, and the one purposive movement more, pronounced; the one effectual way is at length established and the others, which were but palliatives, disappear. (d) When things have advanced so far that some one definite movement is definitely represented along with the painful sensation it remedies, it is not long before a still further advance is possible and we have *preventive movements*. Thanks to the orderliness of things, dangers have their premonitions. After a time, therefore, the occurrence of some signal sensation revives the image of the harm that has previously followed in its wake, and a movement—either like the first, or another that has to be selected from the random tries of fear—occurs in time to avert the impending ill. (e) In like manner, provided the cravings of appetite are felt, any signs of the presence of pleasurable objects prompt to movements for their enjoy-

ment or appropriation. In these last cases we have action determined by perceptions. The cases in which the subject is incited to action by ideas as distinct from perceptions require a more detailed consideration; such are the facts mainly covered by the term "desire."

Desire.

By the time that ideas are sufficiently self-sustaining to form trains that are not wholly shaped by the circumstances of the present, entirely new possibilities of action are opened up. We can desire to live again through experiences of which there is nothing actually present to remind us, and we can desire a new experience which as yet we only imagine. We often, no doubt, apply the term to the simpler states mentioned under (e) in the last paragraph: the fox in the fable is said to have desired the grapes he vilified because out of his reach. Again, at the other extreme it is usual to speak of a desire for honour, or for wealth, and the like; but such are not so much single states of mind as inclinations or habitual desires. Moreover, abstractions of this kind belong to a more advanced stage of development than that at which desire begins, and of necessity imply more complicated grounds of action than we can at present examine. The essential characteristics of desire will be more apparent if we suppose a case somewhere between these extremes. A busy man reads a novel at the close of the day, and finds himself led off by a reference to angling or tropical scenery to picture himself with his rods packed *en route* for Scotland, or booked by the next steamer for the fairyland of the West Indies. Presently, while the ideas of Jamaica or fishing are at least as vividly imagined as before, the fancied preparations receive a rude shock as the thought of his work recurs. Some such case we may take as typical and attempt to analyse it.

First of all it is obviously true, at least of such more concrete desires, that what awakens desire at one time fails to do so at another, and that we are often so absorbed or content with the present as not to be amenable to (new) desires at all. A given X or Y cannot, then, be called desirable *per se*, it is only desirable by relation to the contents of consciousness at the moment. Of what nature is this relation? (1) At the level of psychical life that we have now reached very close and complete connexions have been formed between ideas and the movements necessary for their realization, so that when the idea is vividly present these movements are apt to be nascent. This association is the result of subjective selection—i.e., of feeling—but, being once established, it persists like other associations independently of it. (2) Those movements are especially apt to become nascent which have not been recently executed, which are therefore fresh and accompanied by the organic sensations of freshness, but also those which are frequently executed, and so from habit readily aroused. The latter fact, which chiefly concerns habitual desires, may be left aside for a time. (3) At times, then, when there is a lack of present interests, or when these have begun to wane, or when there is positive pain, attention is ready to fasten on any new suggestion that calls for more activity, requires a change of active attitude, or promises relief. Such spontaneous concentration of attention ensures greater vividness to the new idea, whatever it be, and to its belongings. In some cases this greater vividness may suffice. This is most likely to happen when the new idea affords intellectual occupation, and this is at the time congenial, or with indolent and imaginative persons who prefer dreaming to doing. (4) But when the new idea does not lead off the pent-up stream of action by opening out fresh channels, when, instead of this, it is one that keeps them intent upon itself in an attitude comparable to expectation, then we have desire. In such a state the intensity of the re-presentation is not adequate to the intensity of the

incipient actions it has aroused. This is most obvious when the latter are directed towards sensations or percepts, and the former remains only an idea. If it were possible by concentrating attention to convert ideas into percepts, there would be an end of most desires: "if wishes were horses beggars would ride." (5) But our voluntary power over movements is in general of this kind: here the fiat may become fact. When we cannot hear we can at least listen, and, though there be nothing to fill them, we can at least hold out our hands. It would seem, then, that the source of desire lies essentially in this excess of the active reaction above the intensity of the re-presentation (the one constituting the "impulse," the other the "object" of desire, or the desideratum), and that this disparity rests ultimately on the fact that movements have, and sensations have not, a subjective initiative. (6) The impulse or striving to act will, as already hinted, be stronger the greater the available energy, the fewer the present outlets, and, habits apart, the fresher the new opening for activity. (7) Finally, it is to be noted that, when such inchoate action can be at once consummated, desire ends where it begins: to constitute a definite state of desire there must be not only an obstacle to the realization of the desideratum—if this were all we should rather call the state one of wishing—but an obstacle to its realization by means of the actions its representation has aroused.

However the desire may have been called forth, its intensity is primarily identical with the strength of this impulse to action, and has no definite or constant relation to the amount of pleasure that may result from its satisfaction. The feeling directly consequent on desire as a state of want and restraint is one of pain, and the reaction which this pain sets up may either suppress the desire or prompt to efforts to avoid or overcome the obstacles in its way. To inquire into these alternatives would lead us into the higher phases of voluntary action; but we must first consider the relation of desire to feeling more closely.

Instances are by no means wanting of very imperious desires accompanied by the clear knowledge that their gratification will be positively distasteful.¹ On the other hand it is possible to recollect or picture circumstances known or believed to be intensely pleasurable without any desire for them being awakened at all: we can regret or admire without desiring. Yet there are many psychologists who maintain that desire is excited only by the prospect of the pleasure that may arise through its gratification, and that the strength of the desire is proportional to the intensity of the pleasure thus anticipated. *Quidquid petitur, petitur sub specie boni* is their main formula. The plausibility of this doctrine rests partly upon a seemingly imperfect analysis of what strictly pertains to desire and partly on the fact that it is substantially true both of what we may call "presentation-prompted" action, which belongs to an earlier stage than desire, and of the more or less rational action that comes later. In the very moment of enjoyment it may be fairly supposed that action is sustained solely by the pleasure received and is proportional to the intensity of that pleasure. But there is here no re-presentation and no seeking; the conditions essential to desire, therefore, do not apply. Again, in rational action, where both are present, it may be true—to quote the words of an able advocate of the view here controverted—that "our character as rational beings is to desire everything exactly according to its pleasure value."² But consider what such conceptions as the good, pleasure value, and rational action involve. Here we have foresight and calculation, regard for self as an object of permanent

¹ As such an instance may be cited Plato's story of Leontius, the son of Aglaon, in *Rep.* iv. 439 *fin.*

² Bain, *Emotions and Will*, 3d ed., p. 438.

interest,—Butler's cool self-love; but desire as such is blind, without either the present certainty of sense or the assured prevision of reason. Pleasure in the past, no doubt, has usually brought about the association between the representation of the desired object and the movement for its realization; but neither the recollection of this pleasure nor its anticipation is necessary to desire, and even when present they do not determine what urgency it will have. The best proof of this lies in certain habitual desires. Pleasures are diminished by repetition, whilst habits are strengthened by it; if the intensity of desire, therefore, were proportioned to the "pleasure value" of its gratification, the desire for renewed gratification should diminish as this pleasure grows less; but, if the present pain of restraint from action determines the intensity of desire, this should increase as the action becomes habitual. And observation seems to show that, unless prudence suggest the forcible suppression of belated desires or the active energies themselves fail, desires do in fact become more imperious, although less productive of positive pleasure, as time goes on.

In this there is, of course, no exception to the general principle that action is consequent on feeling,—a greater pleasure being preferred before a less, a less pain before a greater; for, though the feeling that follows upon its satisfaction be less or even change entirely, still the pain of the unsatisfied desire increases as the desire hardens into habit. It is also a point in favour of the position here taken that appetites, which may be compared to inherited desires, certainly prompt to action by present pain rather than by prospective pleasure.

Intellection.

Desire naturally prompts to the search for the means to its satisfaction and frequently to a mental rehearsal of various possible courses of action, their advantages and disadvantages. Thus, by the time the ideational continuum has become, mainly by the comparatively passive working of association, sufficiently developed to furnish thinking material, motives are forthcoming for thinking to begin. It is obviously impossible to assign any precise time for this advance; like all others, it is gradual. Fitfully, in strange circumstances and under strong excitement, the lower animals give unmistakable signs that they can understand and reason. But thought as a permanent activity may be fairly said to originate in and even to depend upon the acquisition of speech. This indispensable instrument, which more than anything else enables our psychological individual to advance to the distinctly human or rational stage, consists of gestures and vocal utterances, which were originally—and indeed are still to a large extent—emotional expressions.¹ It is a question of the highest

¹ It must here be noted that, though we still retain our psychological standpoint, the higher development of the individual is only possible through intercourse with other individuals, that is to say, through society. Without language we should be mutually exclusive and impenetrable, like so many physical atoms; with it each several mind may transcend its own limits and share the minds of others. As a herd of individuals mankind would have a natural history as other animals have; but personality can only emerge out of intercourse with persons, and of such intercourse language is the means. But, important as is this addition of a transparent and responsive world of minds to the dead opaqueness of external things, the development of our psychological individual still remains a purely individual development. The only new point is—and it is of the highest importance to keep it in sight—that the materials of this development no longer consist of nothing but presentations elaborated by a single mind in accordance with psychical laws. But that combination of individual experiences that converts subjective idiosyncrasy and isolation into the objectivity and solidarity of Universal Mind only affects the individual in accordance with psychical laws, and we have no need therefore to overstep our proper domain in studying the advance from the non-rational phase to the phase of reason.

interest to ascertain the general mode of its elaboration; but as to this the reader must consult the article PHILOLOGY (vol. xviii. p. 766 *sq.*). Our space will only allow us to note in what way language, when it already exists, is instrumental in the development as distinct from the communication of thought. But, first of all, what in general is thinking, of which language is the instrument?

In entering upon this inquiry we are really passing one of the hardest and fastest lines of the old psychology,—that between sensation and understanding. So long as it was the fashion to assume a twofold multiplicity of faculties the need was less felt for a clear exposition sense of their connexion. A man had senses and intellect much as he and un-had eyes and ears; the heterogeneity in the one case was no more puzzling than in the other. But for psychologists who do not cut ing. the knot in this fashion it is confessedly a hard matter to explain the relation of the two. The contrast of receptivity and activity hardly avails, for all presentation involves activity and essentially the same activity, that of attention. Nor can we well maintain that the presentations attended to differ in kind, albeit such a view has been held from Plato downwards. *Nihil est in intellectu quod non fuerit prius in sensu*: the blind and deaf are necessarily without some concepts that we possess. If pure being is pure nothing, pure thought is equally empty. Thought consists of a certain elaboration of sensory and motor presentations and has no content apart from these. We cannot even say that the forms of this elaboration are psychologically *a priori*; on the contrary, what is epistemologically the most fundamental is the last to be psychologically realized. This is not only true as a fact; it is also true of necessity, in so far as the formation of more concrete concepts is an essential preliminary to the formation of others more abstract,—those most abstract, like the Kantian categories, &c., being thus the last of all to be thought out or understood. And though this formative work is substantially voluntary, yet, if we enter upon it, the form at each step is determined by the so-called matter, and not by us; in this respect "the spontaneity of thought" is not really freer than the receptivity of sense.² It is sometimes said that thought is synthetic, and this is true; but imagination is synthetic also; and the processes which yield the ideational train are the only processes at work in intellectual synthesis. Moreover, it would be arbitrary to say at what point the mere generic image ceases and the true concept begins,—so continuous are the two. No wonder, therefore, that English psychology has been prone to regard thought as only a special kind of perception—perceiving the agreement or disagreement of ideas—and the ideas themselves as mainly the products of association. Yet this is much like confounding observation with experiment or invention,—the act of a cave-man in betaking himself to a drifting tree with that of Noah in building himself an ark. In reverie, and even in understanding the communications of others, we are comparatively passive spectators of ideational movements, non-voluntarily determined. But in thinking or "intellection," as it has been conveniently termed, there is always a search for something more or less vaguely conceived, for a clue which will be known when it occurs by seeming to satisfy certain conditions. Thinking may be broadly described as solving a problem,—finding an AX that is B. In so doing we start from a comparatively fixed central idea or intuition and work along the several diverging lines of ideas associated with it,—hence far the aptest and in fact the oldest description of thought is that it is *discursive*. Emotional excitement—and at the outset the natural man does not think much in cold blood—quickens the flow of ideas: what seems relevant is at once contemplated more closely, while what seems irrelevant awakens little interest and receives little attention. At first the control acquired is but very imperfect; the actual course of thought of even a disciplined mind falls far short of the clearness, distinctness, and coherence of the logician's ideal. Familiar associations hurry attention away from the proper topic, and thought becomes not only discursive but wandering; in place of concepts of fixed and crystalline completeness, such as logic describes, we may find a congeries of ideas but imperfectly compacted into one generic idea, subject to continual transformation and implicating much that is irrelevant and confusing.

Thus, while it is possible for thought to begin without Thought language, just as arts may begin without tools, yet language and language enables us to carry the same process enormously farther. In the first place it gives us an increased command of even such comparatively concrete generic images as can be

² Locke, so often misrepresented, expressed this truth according to his lights in the following:—"The earth will not appear painted with flowers nor the fields covered with verdure whenever we have a mind to it. . . . Just thus it is with our understanding: all that is voluntary in our knowledge is the employing or withholding any of our faculties from this or that sort of objects and a more or less accurate survey of them" (*Essay*, iv. 13, 2).

formed without it. The name of a thing or action becomes for one who knows the name as much an objective mark or attribute as any quality whatever can be. The form and colour of what we call an "orange" are perhaps even more intimately combined with the sound and utterance of this word than with the taste and fragrance which we regard as strictly essential to the thing. But, whereas its essential attributes often evade us, we can always command its nominal attribute, in so far as this depends upon movements of articulation. By uttering the name (or hearing it uttered) we have secured to us, in a greater or less degree, that superior vividness and definiteness that pertain to images reinstated by impressions: our idea approximates to the fixity and independence of a percept (comp. p. 57 above). With young children and uncultured minds—who, by the way, commonly "think aloud"—the gain in this respect is probably more striking than those not confined to their mother-tongue or those used to an analytical handling of language at all realize.¹ When things are thus made ours by receiving names from us and we can freely manipulate them in idea, it becomes easier mentally to bring together facts that logically belong together, and so to classify and generalize. For names set us free from the cumbersome tangibility and particularity of perception, which is confined to just what is presented here and now. But as ideas increase in generality they diminish in definiteness and unity; they not only become less pictorial and more schematic, but they become vague and unsteady as well, because formed from a number of concrete images only related as regards one or two constituents, and not assimilated as the several images of the same thing may be. The mental picture answering to the word "horse" has, so to say, body enough to remain a steady object when under attention from time to time; but that answering to the word "animal" is perhaps scarcely twice alike. The relations of things could thus never be readily recalled or steadily controlled if the names of those relations, which as words always remain concrete, did not give us a definite hold upon them,—make them comprehensible. Once these "airy nothings" have a name, we reap again the advantages a concrete constituent affords: by its means that which is relevant becomes more closely associated, and that which is irrelevant—abstracted from—falls off. When what answers to the logical connotation or meaning of a concept is in this way linked with the name, it is no longer necessary that such "matter or content" should be distinctly present in consciousness. It takes time for an image to raise its associates above the threshold; and, when all are there, there is more demand upon attention in proportion. There is thus a manifest economy in what Leibnitz happily styled "symbolic," in contrast to "intuitive" thinking. Our power of efficient attention is limited, and with words for counters we can, as Leibnitz remarks, readily perform operations involving very complex presentations, and wait till these operations are concluded before realizing and spreading out the net result in sterling coin.

But this simile must not mislead us. In actual thinking there never is any complete separation between the symbol and the ideas symbolized: the movements of the one are never entirely suspended till those of the other are complete. "Thus," says Hume, "if, instead of saying, that in war the weaker have always recourse to negotiation, we should say, that they have always recourse to conquest, the custom which we have acquired of attributing certain relations to ideas still follows the words and makes us

immediately perceive the absurdity of that proposition."² How intimately the two are connected is shown by the surprises that give what point there is to puns, and by the small confusion that results from the existence of homonymous terms. The question thus arises—What are the properly ideational elements concerned in thought? Over this question psychologists long waged fight as either nominalists or conceptualists. The former maintain that what is imaged in connexion with a general concept, such as triangle, is some individual triangle "taken in a certain light,"³ while the latter maintain that an "abstract idea" is formed embodying such constituents of the several particulars as the concept connotes, but dissociated from the specific or accidental variations that distinguish one particular from another. As often happens in such controversies, each party saw the weak point in the other. The nominalists easily showed that there was no distinct abstract idea representable apart from particulars; and the conceptualists could as easily show that a particular presentation "considered in a certain light" is no longer merely a particular presentation nor yet a mere crowd of presentations. The very thing to ascertain is what this consideration in a certain light implies. Perhaps a speedier end might have been put to this controversy if either party had been driven to define more exactly what was to be understood by image or idea. Such ideas as are possible to us apart from abstraction are, as we have seen, revived percepts, not revived sensations, are complex total representations made up of partial re-presentations (comp. p. 57). Reproductive imagination is so far but a faint rehearsal of actual perceptions, and constructive imagination but a faint anticipation of possible perceptions. In either case we are busied with elementary presentations complicated or synthesized to what are tantamount to intuitions, in so far as the forms of intuition remain in the idea, though the fact, as tested by movement, &c., is absent. The several partial re-presentations, however, which make up an idea might also be called ideas, not merely in the wide sense in which every mental object may be so called, but also in the narrower sense as secondary presentations, i.e., as distinguished from primary presentations or impressions. But such isolated images of an impression, even if possible, would no more be intuitions than the mere impression itself would be one: taken alone the one would be as free of space and time as is the other. Till it is settled, therefore, whether the ideational elements concerned in conception are intuitive complexes or something answering to the ultimate elements of these, nothing further can be done.

In the case of what are specially called "concrete" as distinct from "abstract" conceptions—if this rough-and-ready, but unscientific, distinction may be allowed—the idea answering to the concept differs little from an intuition, and we have already remarked that the generic image (*Gemeinbild* of German psychologists) constitutes the connecting link between imagination and conception. But even concerning these it is useless to ask what does one imagine in thinking, e.g., of triangle or man or colour. We never—except for the sake of this very inquiry—attempt to fix our minds in this manner upon some isolated conception; in actual thinking ideas are not in consciousness alone and disjointedly but as part of a context. When the idea "man" is present, it is present in some proposition or question, as—Man is the paragon of animals; In man there is nothing great but mind; and so on. It is quite clear that in understanding or mentally verifying such statements very different constituents out of the

Thought
and idea-
tion.

¹ Raskin, in his *Fors Clavigera*, relates that the sight of the word "crocodile" used to frighten him as a child so much that he could not feel at ease again till he had turned over the page on which it occurred.

² *Treatise of Human Nature*, pt. i. § vii. (Green and Grose's ed.) p. 331.

³ So Hume, *op. cit.*, p. 456.

whole complex "man" are prominent in each. Further, what is present to consciousness when a general term is understood will differ, not only with a different context, but also the longer we dwell upon it: we may either analyse its connotation or muster its denotation, as the context or the cast of our minds may determine. Thus what is relevant is alone prominent, and the more summary the attention we bestow the less the full extent and intent of the concept are displayed. To the nominalist's objection, that it is impossible to imagine a man without imagining him as either tall or short, young or old, dark or light, and so forth, the conceptualist might reply that at all events percepts may be clear without being distinct, that we can recognize a tree without recognizing what kind of tree it is, and that, moreover, the objection proves too much: for, if our image is to answer exactly to fact, we must represent not only a tall or a short man but a man of definite nature,—one not merely either light or dark, but of a certain precise complexion. But the true answer rather is that in conceiving as such we do not necessarily imagine a man or a tree at all, any more than—if such an illustration may serve—in writing the equation to the parabola we necessarily draw a parabola as well.

The individuality of a concept is thus not to be founded with the sensible concreteness of an intuition either distinct or indistinct, and "the pains and skill" which Locke felt were required in order to frame what he called an abstract idea are not comparable to the pains and skill that may be necessary to discriminate or decipher what is faint or fleeting. The material "framed" consists no doubt of ideas, if by this is meant that in thinking we work ultimately with the ideational continuum, but what results is never a mere intuitive complex nor yet a mere group of such. The concept or "abstract idea" only emerges when a certain intelligible relation is established among the members of such a group; and the very same intuition may furnish the material for different concepts as often as a different *gestiges Band* is drawn between them. The stuff of this bond, as we have seen, is the word, and this brings into the foreground of consciousness when necessary those elements—whether they form an intuition or not—which are relevant to the concept. Conception, then, is not identical with imagination, although the two terms are still often, and were once generally, regarded as synonymous. The same ultimate materials occur in each; but in the one they start with and retain a sensible form, in the other they are elaborated into the form which is called "intelligible."

General character and growth of intel-
lection. The distinctive character of this intellectual synthesis lies, we have seen, in the fact that it is determined entirely by what is synthesized, whether that be the elementary constituents of intuitions or general relations of whatever kind among these. It differs, therefore, in being selective from the synthesis of ideation, which rests upon contiguity and unites together whatever occurs together. It differs also from any synthesis, though equally voluntary in its initiation, which is determined by a purely subjective preference, in that intellection depends upon objective relations alone. Owing to the influence of logic, which has long been in a much more forward state than psychology, it has been usual to resolve intellection into comparison, abstraction, and classification, after this fashion: ABCM and ABCN are compared, their differences M and N left out of sight, and the class notion ABC formed including both; the same process repeated with ABC and ABD yields a higher class notion AB; and so on. But our ideational continuum is not a mere string of ideas of concrete things, least of all such concrete things as this view implies. Not till our daily life resembles that of a museum porter receiving specimens will our higher mental

activity be comparable to that of the savant who sorts such specimens into cases and compartments. What we perceive is a world of things in continual motion, waxing, waning, the centres of manifold changes, affecting us and apparently affected by each other, amenable to our action and, as it seems, continually interacting among themselves. Even the individual thing, as our brief analysis of perception attempts to show (comp. pp. 55, 56), is not a mere sum of properties which can be taken to pieces and distributed like type, but a whole combined of parts very variously related. To understand intellection we must look at its actual development under the impetus of practical needs, rather than to logical ideals of what it ought to be. Like other forms of purposive activity, thinking is primarily undertaken as a means to an end, and especially the end of economy. It is often easier and always quicker to manipulate ideas than to manipulate real things; to the common mind the thoughtful man is one who "uses his head to save his heels." In all the arts of life, in the growth of language and institutions, in scientific explanation, and even in the speculations of philosophy, we may remark a steady simplification in the steps to a given end or conclusion, or—what is for our present inquiry the same thing—the attainment of better results with the same means. The earliest machines are the most cumbersome and clumsy, the earliest speculations the most fanciful and anthropomorphic. Gradually imitation yields to invention, the natural fallacy of *post hoc, ergo propter hoc* to methodical induction, till what is essential and effective is realized and appreciated and what is accidental and inert is discarded and falls out of sight. In this way man advances in the construction of a complete mental clue or master-key to the intricacies of the real world, but this key is still the counterpart of the world it enables us to control and explain.

To describe the process by which such insight is attained as a mere matter of abstraction deserves the stigma of "soulless blunder" which Hegel applied to it. Of course if attention is concentrated on X it must *pro tanto* be abstracted from Y, and such command of attention may require "some pains and skill." But to see in this invariable accompaniment of thinking its essential feature is much like the schoolboy's saying that engraving consists in cutting fine shavings out of a hard block. The great thing is to find out what are the light-bearing and fruit-bearing combinations. Moreover, thinking does not begin with a conscious abstraction of attention from recognized differences in the way logicians describe. The actual process of generalization, for the most part at all events, is much simpler. The same name is applied to different things or events because only their more salient features are perceived at all. Their differences, so far from being consciously and with effort left out of account, often cannot be observed when attention is directed to them: to the inexperienced all is gold that glitters. Thus, and as an instance of the principle of progressive differentiation already noted (p. 42), we find genera recognized before species, and the species obtained by adding on differences, not the genus by abstracting from them. Of course such vague and indefinite concepts are not at first logically general: they only become so when certain common elements are consciously noted as pertaining to presentations in other respects qualitatively different, as well as numerically distinct. But actually thinking starts from such more potential generality as is secured by the association of a generic image with a name. So far the material of thought is always general,—is freed, that is, from the local and temporal and other defining marks of percepts.

The process of thinking itself is psychologically much better described as (1) an analysis and (2) a re-synthesis of

Thought
as ana-
lytic.

this material already furnished by the ideational trains. The logical resolution of thought into hierarchies of concepts arranged like Porphyry's tree, into judgments uniting such concepts by means of a logical copula, &c., is the outcome of later reflexion—mainly for technical purposes—upon thought as a completed product, and entirely presupposes all that psychology has to explain. The logical theory of the formation of concepts by generalization (or abstraction) and by determination (or concretion)—i.e., by the removal or addition of defining marks—assumes the previous existence of the very things to be formed, for these marks or attributes—X's and Y's, A's and B's—are themselves already concepts. Moreover, the act of generalizing or determining is really an act of judgment, so that the logician's account of conception presupposes judgment, while at the same time his account of judgment presupposes conception. But this is no evil; for logic does not essay to exhibit the actual genesis of thought but only an ideal for future thinking. Psychologically—that is to say, chronologically—the judgment is first. The growing mind, we may suppose, passes beyond simple perception when some striking difference in what is at the moment perceived is the occasion of a conflict of presentations (comp. p. 62). The stalking hunter is not instantly recognized as the destroying biped, because he crawls on all fours; or the scarecrow looks like him, and yet not like him; for, though it stands on two legs, it never moves. There is no immediate assimilation: percept and idea remain distinct till, on being severally attended to and compared, what is there is known in spite of the differences. Recognition under such circumstances is in itself a judgment; but of more account is the further judgment involved in it or accompanying it—that which connects the new fact with the old idea. Though actually complex, as the result of a combination of impressions, generic images are not necessarily known as complexes when they first enter into judgments; as the subjects of such judgments they are but starting-points for predication.—It crawls; It does not move; and the like. Such impersonal judgments, according to most philologists, are in fact the earliest; and we may reasonably suppose that by means of them our generic images have been partially analysed, and have attained to something of the distinctness and constancy of logical concepts. But the analysis is rarely complete: a certain confused and fluctuating residuum remains behind. The psychological concept merges at sundry points into those cognate with it,—in other words, the continuity of the underlying memory-train still operates; only the ideal concepts of logic are in all respects *totus, teres, utque rotundus*. Evidence of this, if it seem to any to require proof, is obtainable on all sides, and, if we could recover the first vestiges of thinking, would be more abundant still.

Logical
bias in
psycho-
logy.

But, if we agree that it is through acts of judgment which successively resolve composite presentations into elements that concepts first arise, it is still very necessary to inquire more carefully what these elements are. On the one side we have seen logicians comparing them to so many letters, and on the other psychologists enumerating the several sensible properties of gold or wax—their colour, weight, texture, &c.—as instances of such elements. In this way formal logic and sensationalist psychology have been but blind leaders of the blind. Language, which has enabled thought to advance to the level at which reflexion about thought can begin, is now an obstacle in the way of a thorough analysis of it. A child or savage would speak only of "red" and "hot," but we of "redness" and "heat." They would probably say, "Swallows come when the days are lengthening and snipe when they are shortening"; we say, "Swallows are spring and snipe are winter migrants." Instead of "The sun shines and plants grow," we should say, "Sunlight is the cause of vegetation." In short, there is a tendency to resolve all concepts into substantive concepts; and the reason of this is not far to seek. Whether the subject or starting-point of our discursive thinking be actually what we perceive as a thing, or whether it be a quality, an action, an effectuation (i.e., a transitive action), a concrete spatial or temporal relation, or finally, a

resemblance or difference in these or in other respects, it becomes by the very fact of being the central object of thought *pro tanto* a unity, and all that can be affirmed concerning it may so far be regarded as its property or attribute. It is, as we have seen, the characteristic of every completed concept to be a fixed and independent whole, as it were, crystallized out of the still-fluent matrix of ideas. Moreover, the earliest objects of thought and the earliest concepts must naturally be those of the things that live and move about us; hence, then—to seek no deeper reason for the present—this natural tendency, which language by providing distinct names powerfully second, to reify or personify not only things but every element and relation of things which we can single out, or, in other words, to concrete our abstracts.¹ It is when things have reached this stage that logic begins. But ordinary, so-called formal, logic, which intends to concern itself not with thinking but only with the most general structure of thought, is debarred from recognizing any difference between concepts that does not affect their relations as terms in a proposition. As a consequence it drifts inevitably into that compartmental logic or logic of extension which knows nothing of categories or predicables, but only of the one relation of whole and part qualitatively considered. It thus pushes this reduction to a common denomination to the utmost: its terms, grammatically regarded, are always names and symbolize classes or compartments of things. From this point of view all disparity among concepts, save that of contradictory exclusion, and all connexion, save that of partial coincidence, are at an end.

Of a piece with this are the logical formula for a simple judgment, X is Y, and the corresponding definitions of judgment as the comparison of two concepts and the recognition of their agreement or disagreement.² It certainly is possible to represent every judgment as a comparison, although the term is strictly adequate to only one kind and is often a very artificial description of what actually happens. But for a logic mainly concerned with inference—i.e., with explicating what is implicated in any given statements concerning classes—there is nothing more to be done but to ascertain agreements or disagreements; and the existence of these, if not necessarily, is at least most evidently represented by spatial relations. Such representation obviously implies a single ground of comparison only and therefore leaves no room for differences of category. The resolution of all concepts into class concepts and that of all judgments into comparisons thus go together. On this view if a concept is complex it can only be so as a class combination; and, if the mode of its synthesis could be taken account of at all, this could only be by treating it as an element in the combination like the rest:—iron is a substance, &c., virtue a quality, &c., distance a relation, &c., and so on. There is much of directly psychological interest in this thoroughgoing reduction of thought to a form which makes its consistency and logical concatenation conspicuously evident. But of the so-called matter of thought it tells us nothing. And, as said, there are many forms in that matter of at least equal moment, both for psychology and for epistemology; these formal logic has tended to keep out of sight.

It has generally been under the bias of such a formal or computational logic that psychologists, and especially English psychologists, have entered upon the study of mind. They have brought with them an analytic scheme which affords a ready place for sensations or "simple ideas" as the elements of thought, but none for any differences in the combinations of these elements. Sensations being in their very nature concrete, all generality becomes an affair of names; and, as Sigwart has acutely remarked, sensationalism and nominalism always go together. History would have borne him out if he had added that a purely formal logic tends in like manner to be nominalistic (see *Logic*, vol. xiv. p. 791).

If we are still to speak of the elements of thought, we must extend this term so as to include not only the sensory elements we are said to receive but three distinct ways in which this pure matter is combined:—(1) the forms of intuition,³—Time and Space; (2) the real categories,—Substance, Attribute, State, Act, Effect, End or Purpose, &c.—the exact determination of which is not here in place; and (3) certain formal (logical and mathematical) categories,—as Unity, Difference, Identity, Likeness. These can no more be obtained by such a process of abstraction and generalization as logicians and psychologists alike have been wont to describe than the melody could be obtained

¹ See Wundt, *Logik*, i. p. 107 sq., where this process is happily styled "die kategoriale Verschiebung der Begriffe."

² Comp. Hamilton: "To judge (*apñevai, judicare*) is to recognize the relation of congruence or of conflict in which two concepts, two individual things, or a concept and an individual, compared together, stand to each other" (*Lectures on Logic*, i. p. 225).

³ As to these it must suffice to refer to what has been already said; comp. pp. 53 and 64 sq.

by suppressing all the several notes in a tune. They are not primarily concepts more general than all others in the sense in which animal is more general than man, but rather distinct methods of relating or synthesizing presentations. Kant, though he accepted almost unquestioned the logic and psychology current in his day, has yet been the occasion, in spite of himself, of materially advancing both, and chiefly by the distinction he was led to make between formal and transcendental logic. In his exposition of the latter he brings to light the difference between the "functions of the understanding" in synthesizing—or, as we might say, organizing—percepts into concepts and the merely analytic subsumption of *abc* and *abd* under *ab*,—*a*, *b*, *c*, and *d* being what they may. Unlike other concepts, categories as such do not in the first instance signify objects of thought however general, but these functions of the understanding in constituting objects. In fine, they all imply some special process, and into these processes it is the business of psychology to inquire. But only the briefest attempt at such inquiry is here possible.

Concept-
tion of
unity.

To begin with what are *par excellence* formal categories, and among these with that which is the most fundamental and formal of all—How do we come by the conception of unity? "Amongst all the ideas we have," says Locke, "as there is none suggested to the mind by more ways, so there is none more simple than that of unity, or one. It has no shadow of variety or composition in it; every object our senses are employed about, every idea in our understandings, every thought of our minds, brings this idea along with it."¹ And the like with painful iteration has been said by almost all English psychologists since. Such consensus notwithstanding, to assign a sensible origin to unity is certainly a mistake,—one of a class of mistakes already more than once referred to, which consist in transferring to the data of sense all that is implied in the language necessarily used in speaking of them. The term "a sensation" no doubt carries along with it the idea of unity, but the bare sensation as received brings along with it nothing but itself. And, if we consider sensory consciousness merely, we do not receive a sensation, and then another sensation, and so on *seriatim*; but we have always a continuous diversity of sensations even when these are qualitatively sharply differentiated. Moreover, if unity were an impression of sense and passively received, it would, in common with other impressions, be unamenable to change. We cannot see red as blue, but we can resolve many (parts) into one (whole), and *vice versa*.² Unity, then, is the result of an act the occasions for which, no doubt, are at first non-voluntarily determined; but the act is still as distinct from them as is attention from the objects attended to. It is to that movement of attention already described in dealing with ideation (p. 61) that we must look as the source of this category. This same movement, in like manner, yields us temporal signs; and the complex unity formed by a combination of these is what we call number. When there is little or no difference between the field and the focus of attention, unifying is an impossibility, whatever the impressions received may be. On the other hand, as voluntary acts of concentration become more frequent and distinct the variegated continuum of sense is shaped into intuitions of definite things and events. Also, as soon as words facilitate the control of ideas, it becomes possible to single out special aspects and relations of

things as the subjects or starting-points of our discursive thinking. Thus the forms of unity are manifold; every act of intuition or thought, whatever else it is, is an act of unifying.

It is obvious that the whole field of consciousness at any moment can never be actually embraced as one. What is unified becomes thereby the focus of consciousness and so leaves an outlying field; so far unity may be held to imply plurality. But it cannot with propriety be said that in a simple act of attention the field of consciousness is analysed into two distinct parts, *i.e.*, two unities,—*this* (now attended to) and *the other* or the rest (abstracted from). For the not-*this* is but the rest of a continuum and not itself a whole; it is left out but not determined, as the bounding space is left out when a figure is drawn. To know two unities we must connect both together; and herein comes to light the difference between the unity which is the form of the concept or subject of discourse and the unity of a judgment. The latter is of necessity complex; the former may or may not be. But in any case the complexity of the two is different. If the subject of thought is not only clear but distinct—*i.e.*, not merely defined as a whole but having its constituents likewise more or less defined—such distinctness is due to previous judgments. At any future time these may of course be repeated; such are the analytical or explicative judgments of logic. As the mere subject of discourse it is, however, a single unity simultaneously apprehended; the relation ascertained between it and its predicate constitutes the unity of judgment, a unity which is comprehended only when its parts are successively apprehended.

But, though a judgment is always a complex unity, the extent of this complexity seems at first sight to vary as the form of synthesis varies. Formal logic, as we have seen, by throwing the form of synthesis into the predicate has no difficulty in reducing every judgment to an *S* is *P*. But, if we at all regard the matter thought, it is certain, for example, that "It is an explosion" is less complex than "The enemy explodes the mine." The first answers one question; the second answers three. But as regards the more complex judgment both the process of ascertaining the fact and the language in which it is expressed show that the three elements concerned in it are not synthesized at once. Suppose we start from the explosion,—and changes or movements are not only apt to attract attention first, but, when recognized as events and not as abstracts personified, they call for some supplementing beyond themselves—then in this case we may search for the agent at work or for the object affected, but not for both at once. Moreover, if we find either, a complete judgment at once ensues: "The enemy explodes," or "The mine is exploded." The original judgment is really due to a synthesis of these two. But, when the results of former judgments are in this manner taken up into a new judgment, a certain "condensation of thought" ensues. Of this condensation the grammatical structure of language is evidence, though logical manipulation—with great pains—obliterates it. Thus our more complex judgment would take the form—"The enemy is now mine-exploding" or "The mine is enemy-exploded," according as one or other of the simpler judgments was made first. An examination of other cases would in like manner tend to show that intellectual synthesis is always—in itself and apart from implications—a binary synthesis. Wundt, to whom belongs the merit of first explicitly stating this "law of dichotomy or duality"³ as the cardinal principle of discursive thinking, contrasts it with synthesis by mere association. This, as running on continuously, he represents thus—*A-B-C-D* . . . ; the

¹ *Essay concerning Human Understanding*, II. xvi. § 1.

² "Wir können eines der hier gedruckten Wörter als *Eins* ansehen, indem wir eine Mannigfaltigkeit von Buchstaben doch in einem abschliessenden Acte zu einem Bilde vereinigen und es von den benachbarten Bildern trennen; wir können es als *Vielheit* ansehen, wenn wir auf den Uebergang von einem Buchstaben zum andern, jeden Schritt absetzend, achten" (Sigwart, *Logik*, II. p. 41).

³ Wundt, *Logik: eine Untersuchung der Principien der Erkenntniss*, I. p. 53 sq.

synthesis of thought, on the other hand, he symbolizes by forms such as the following:—

In explanation of this law as a law of intellection it is hardly sufficient to rest it ultimately on the fact "that in a given moment of time only a single act of apperception is possible."¹ This applies to all syntheses alike. The point surely is that the one thing attended to in an intellectual act is the synthesis of two things, and of two things only, because, as only one movement of attention is possible at a time, only two things at a time can be synthesized. In that merely associative synthesis by which the memory-continuum is produced attention moves from A to B and thence to C without any relation between A and B being attended to at all, although they must have relations, that of sequence, *e.g.*, at least. The intellectual synthesis which follows upon this first resolves the A-B into its elements, and then, if there be any ground for so doing, re-synthesizes them with a consciousness of what the synthesis means.²

Formal categories.

Passing now to the remaining formal categories—Difference, Likeness, Identity—all of which come under the law of duality so far as they imply not a single presentation but some relation between two presentations, we have to seek out the characteristics of the states of mind in which these relations become objects of consciousness. The so-called *fundamentum relationis*, of course, can be nothing but the two presentations concerned. Just as certain, however, is it that the relation itself involves something more than these. Two equal triangles may be made to coincide, but are not necessarily coincident: Dromio of Ephesus might be mistaken for Dromio of Syracuse, but at least they never mistook each other. And this brings us to the point. As Lotze puts it, "Two impressions *a* and *b* are never to be regarded as more than *stimuli* which, by affecting the conscious subject—in its very nature individual and *sui generis*—incite to reaction that activity by means of which there arise the new presentations, such as similarity, equality, contrast, &c."³ The activity thus stimulated is what in other words we call the voluntary concentration of attention; to ascertain, then, what these "new presentations" of difference, likeness, and so forth are, we must analyse carefully what takes place when two impressions *a* and *b* are expressly compared.

Difference and likeness.

"Difference," says Hume, "I consider rather as a negation of relation than as anything real or positive. Difference is of two kinds, as opposed either to identity [unity?] or resemblance. The first is called a difference of *number*, the other of *kind*." The truth seems rather to be that difference in the sense of numerical difference is so far an element in all relations as all imply distinct correlatives. To this extent even identity—or at least the recognition of it—rests on difference, that form of difference, *viz.*, which is essential to plurality. But absolute difference of kind may be considered tantamount not, indeed, to the negation, but at least to the absence, of all formal relation. That this absolute difference—or disparateness, as we may call it—affords no ground for relations becomes evident when we consider (1) that, if we had only a plurality of absolutely different presentations, we should have no consciousness at all (comp. p. 45); and (2) that we never compare—although we distinguish, *i.e.*, recognize, numerical

difference—where presentations seem absolutely or totally different, as are, *e.g.*, a thunderclap and the taste of sugar, or the notion of free trade and that of the Greek accusative. All actual comparison of what is qualitatively different rests upon opposition or contrariety, *i.e.*, upon at least partial likeness (comp. p. 46). This being understood, it is noteworthy that the recognition of such unlikeness is, if anything, more "real or positive" than that of likeness, and is certainly the simpler of the two. In the comparison of sensible impressions—as of two colours, two sounds, the lengths or the directions of two lines, &c.—we find it easier in some cases to have the two impressions that are compared presented together, in others to have first one presented and then the other. But either way the essential matter is to secure the most effective presentation of their difference, which in every case is something positive and, like any other impression, may vary in amount from bare perceptibility to the extremest distance that the continuum to which it belongs will admit. Where no difference or distance at all is perceptible, there we say there is likeness or equality. Is the only outcome, then, that when we pass from *ab* to *ac* there is a change in consciousness, and that when *ab* persists there is none? To say this is to take no account of the operations (we may symbolize them as $ac - ab = cb$, $ab - ab = 0$) by which the difference or the equality results. The change of presentation (*bc*) and absence of change (0) are not here what they are when merely passive occurrences, so to put it. This is evident from the fact that the former is but a single presentation and the latter no presentation at all. The relation of unlikeness, then, is distinguished from the mere "position" of change by (1) the voluntary concentration of attention upon *ab* and *ac* with a view to the detection of this change as *their* difference, and by (2) the act, relating them through it, in that they are judged unlike to that extent. The type of comparison is such superposition of geometrical lines or figures (as, *e.g.*, in Euclid I. iv.): if they coincide we have concrete equality; if they do not their difference is a line or figure. All sensible comparisons conform essentially to this type. In comparing two shades we place them side by side, and passing from one to the other seek to determine not the absolute shade of the second but its shade relative to the first,—in other words, we look out for contrast. We do not say of one "It is dark," for in the scale of shades it may be light, but "It is darker"; or *vice versa*. Where there is no distance or contrast we simply have not *two* impressions, and, as said—if we consider the difference by itself—no impression at all. Two coincident triangles must be perceived as one. The distinction between the one triangle thus formed by two coinciding and the single triangle rests upon something extraneous to this bare presentation of a triangle that is one and the same in both cases. The marks of this numerical distinctness may be various: they may be different temporal signs, as in reduplications of the memory-continuum; or they may be constituents peculiar to each, from which attention is for the moment abstracted, any one of which suffices to give the common or identical constituent a new setting. In general, it may be said (1) that the numerical distinctness of the related terms is secured in the absence of all qualitative difference solely by the intellectual act which has so unified each as to retain what may serve as an individual mark; and (2) that they become related as "like" either in virtue of the active adjustment to a change of impression which their partial assimilation defeats, or in virtue of an anticipated continuance of the impression which this assimilation confirms.

It is in keeping with this analysis that we say in common Identity. speech that two things in any respect similar are so far the same; that, *e.g.*, the two Dromios—

¹ Wundt, *op. cit.*, i. p. 58.

² It need not, of course, be maintained that in every act of thought, no matter how abstract, the ideas related have been previously connected by association. But certainly at the outset this is the case, in such wise that all the forms of intellectual synthesis are prefigured in the connexions of the ideational train or its reduplications.

³ *Grundzüge der Psychologie*, p. 24.

"The one so like the other
As could not be distinguished but by names"—

had the same complexion and the same stature just as we say they had the same mother. This ambiguity in the word "same," whereby it means either individual identity or indistinguishable resemblance, has been often noticed, and from a logical or objective point of view justly complained of as "engendering fallacies in otherwise enlightened understandings." But apparently no one has inquired into its psychological basis, although more than one writer has admitted that the ambiguity is one "in itself not always to be avoided."¹ It is not enough to trace the confusion to the existence of common names and to cite the forgotten controversies of scholastic realism. We are not now concerned with the conformity of thought to things or with logical analysis, but with the analysis of a psychological process. The tendency to treat presentations as if they were copies of things—the objective bias, as we may call it—is the one grand obstacle to psychological observation. Some only realize with an effort that the idea of extension is not extended; no wonder, then, if it should seem "unnatural" to maintain that the idea of two like things does not consist of two like ideas. But, assuming that both meanings of identity have a psychological justification, it will be well to distinguish them and to examine their connexion. Perhaps we might term the one "material identity" and the other "individual identity,"—following the analogy of expressions such as "different things but all made of the same stuff," "the same person but entirely changed." Thus there is unity and plurality concerned in both, and herein identity or sameness differs from singularity or mere oneness, which entails no relation. But the unity and the plurality are different in each, and each is in some sort the converse of the other. In the one, two different individuals partially coincide; in the other, one individual is partially different; the unity in the one case is an individual presentation, in the other is the presentation of an individual.

Material identity. In material identity the unity is that of a single presentation, whether simple or complex, which enters as a common constituent into two or more others. It may be possible of course to individualize it, but as it emerges in a comparison it is a single presentation and nothing more. On account of this absence of individual marks this single presentation is what logicians call "abstract"; but this is not psychologically essential. It may be a generic image which has resulted from the neutralization of individual marks, but it may equally well be a simple presentation, like red, to which such marks never belonged. We come here from a new side upon a truth which has been already expounded at length, viz., that presentations are not given to us as individuals but as changes in a continuum. Time and space—the instruments, as it were, of individualization, which are presupposed in the objective sciences—are psychologically later than this mere differentiation.

Individual identity. The many vexed questions that arise concerning individual identity are metaphysical rather than psychological. But it will serve to bring out the difference between the two forms of identity to note that an identification cannot be established solely by qualitative comparison; an *alibi* or a breach of temporal continuity will turn the flank of the strongest argument from resemblance. Moreover, resemblance itself may be fatal to identification when the law of being is change. But, while temporal and spatial determinations are essential to individual identity, they have, strictly speaking, no individual identity of their own. When we speak of two impressions occurring at the same

time, or localize or project them into the same place, a careful analysis shows only that we detect no difference of temporal and local signs respectively,—in other words, have only special cases of comparison.

As regards the real categories, it may be said generally that these owe their origin in large measure to the anthropomorphic or mythical tendency of human thought, — *τὸ ὁμοίον τῷ ὁμοίῳ γινώσκεισθαι*. Into the formation of these conceptions two very distinct factors enter—(1) the facts of what in the stricter sense we call "self-consciousness," and (2) certain spatial and temporal relations among our presentations themselves. On the one hand, it has to be noted that these spatial and temporal relations are but the occasion or motive—and ultimately perhaps, we may say, the warrant—for the analogical attribution to things of selfness, efficiency, and design, but are not directly the source of the forms of thought that thus arise. On the other hand, it is to be noted also that such forms, although they have an independent source, would never apart from suitable material come into actual existence. If the followers of Hume err in their exclusive reliance upon "associations naturally and even necessarily generated by the order of our sensations" (J. S. Mill), the disciple of Kant errs also who relies exclusively on "the synthetical unity of apperception." The truth is that we are on the verge of error in thus sharply distinguishing the two at all; if we do so momentarily for the purpose of exposition it behoves us here again to remember that mind grows and is not made. The use of terms like "innate," "a priori," "necessary," "formal," &c., without further qualification leads only too easily to the mistaken notion that all the mental facts so named are alike underived and original, independent not only of experience but of each other; whereas but for the forms of intuition the forms of thought would be impossible,—that is to say, we should never have a self-consciousness at all if we had not previously learnt to distinguish occupied and unoccupied space, past and present in time, and the like. But, again, it is equally true that, if we could not feel and move as well as receive impressions, and if experience did not repeat itself, we should never attain even to this level of spatial and temporal intuition. Kant shows a very lame and halting recognition of this dependence of the higher forms on the lower both in his schematism of the categories, and again in correcting in his *Analytic* the opposition of sense and understanding as respectively receptive and active with which he set out in his *Æsthetic*. Still, although what are called the subjective and objective factors of real knowledge advance together, the former is in a sense always a step ahead. We find *again* without us the permanence, individuality, efficiency, and adaptation we have found *first of all* within (comp. p. 56, *b* and *d*). But such primitive imputation of personality, though it facilitates a first understanding, soon proves itself faulty and begets the contradictions which have been one chief motive to philosophy. We smile at the savage who thinks a magnet must need food and is puzzled that the horses in a picture remain for ever still; but few consider that underlying all common-sense thinking there lurks the same natural precipitancy. We attribute to extended things a unity which we know only as the unity of an unextended subject; we attribute to changes among these extended things what we know only when we act and suffer ourselves; and we attribute further both to them and their changes a striving for ends which we know only because we feel. In asking what they are, how they act, and why they are thus and thus, we assimilate them to ourselves, in spite of the differences which lead us by and by to see a gulf between mind and matter. Such instinctive analogies have, like other analogies, to be confirmed, refuted, or modified by further knowledge, *i.e.*,

¹ Comp. J. S. Mill, *Logic*, bk. i. ch. iii. § 11, and *Examination of Hamilton*, 3d ed., ch. xiv. p. 306, note; also Meinong, "Hume-Studien", II., *Wiener Sitzungsberichte (Phil. Hist. Cl.)*, vol. ci. p. 709.

by the very insight into things which these analogies have themselves made possible. That in their first form they were mythical, and that they could never have been at all unless originated in this way, are considerations that make no difference to their validity,—assuming, that is, that they admit, now or hereafter, of a logical transformation which renders them objectively valid. This legitimation is of course the business of philosophy; we are concerned only with the psychological analysis and origin of the conceptions themselves.

Causal-
ity.

As it must here suffice to examine one of these categories, let us take that which is the most important and central of the three, viz., causality or the relation of cause and effect, as that will necessarily throw some light upon the constitution of the others. To begin, we must distinguish three things, which, though very different, are very liable to be confused. (1) Perceiving in a definite case, e.g., that on the sun shining a stone becomes warm, we may say the sun makes the stone warm. This is a concrete instance of predicating the causal relation. In this there is, explicitly at all events, no statement of a general law or axiom, such as we have when we say (2) "Every event must have a cause,"—a statement commonly known as the principle of causality. This again is distinct from what is on all hands allowed to be an empirical generalization, viz., (3) that such and such particular causes have invariably such and such particular effects. With these last psychology is not directly concerned at all: it has only to analyse and trace to its origin the bare conception of causation as expressed in (1) and involved in both these generalizations. Whether only some things have causes, as the notion of chance implies, whether all causes are uniform in their action or some capricious and arbitrary, as the unreflecting suppose,—all this is beside the question for us.

One point in the analysis of the causal relation Hume may be said to have settled once for all: it does not rest upon or contain any immediate intuition of a causal nexus. The two relations that Hume allowed to be perceived (or "presumed to exist"), viz., contiguity in space of the objects causally related and priority in time of the cause before the effect, are the only relations directly discernible. We say indeed "The sun warms the stone" as readily as we say "The sun rises and sets," as if both were matters of direct observation then and there. But that this is not so is evident from the fact that only in some cases when one change follows upon another do we regard it as following from the other: casual coincidence is at least as common as causal connexion. Whence the difference, then, if not from perception? Hume's answer,¹ repeated in the main by English psychologists since, is, as all the world knows, that the difference is the result of association, that when a change β in an object B has been frequently observed to succeed a change α in another object A, the frequent repetition *determines* the mind to a transition from the one to the other. It is this determination, which could not be present at first, that constitutes "the third relation betwixt these objects." This "internal impression" generated by association is then projected; "for 'tis a common observation that the mind has a great propensity to spread itself on external objects."

The subjective origin and the after-projection we must admit, but all else in Hume's famous doctrine seems glaringly at variance with facts. In one respect it proves too much, for all constant sequences are not regarded as causal, as according to his analysis they ought to be; again, in another respect it proves too little, for causal connexion is continually predicated on a first occurrence. The natural man has always distinguished between causes and signs or portents; but there is nothing to show that he produced an effect many times before regarding himself as the cause of it. J. S. Mill has indeed obviated the first objection epistemologically by adding to constant conjunction the further characteristic of "unconditionality." But this is a conception that cannot be psychologically explained from Hume's premisses, unless perhaps by resolving it into the qualification that the invariability must be complete and not partial, whereupon the second objection applies. "Unconditional" is a word for which we can find no meaning as long as we confine our attention to temporal succession. It will not do to say both that an invariable succession generates the idea, and that such invariable succession must be not only invariable but also unconditional in order to generate it. We may here turn the master against the disciple: "the same principle," says Hume, "cannot be both the cause and the effect of another, and this is perhaps the only proposition concerning that relation which is either intuitively or demonstratively certain" (*op. cit.*, p. 391). Unconditionality is then part of the causal relation and yet not the product of invariable repetition.

Perhaps the source of this element in the relation will become clear if we examine more closely the internal impression of the

¹ *Treatise of Human Nature*, pt. iii., § xiv., "Of the idea of necessary connexion."

mind which according to Hume constitutes the whole of our idea of power or efficacy. To illustrate the nature of this impression Hume cites the instant passage of the imagination to a particular idea on hearing the word commonly annexed to it, when "'twill scarce be possible for the mind by its utmost efforts to prevent that transition" (*op. cit.*, p. 393). It is this determination, then, which is felt internally, not perceived externally, that we mistakenly transfer to objects and regard as an intelligible connexion between them. But, if Hume admits this, must he not admit more? Can it be pretended that it is through the workings of association among our ideas that we first feel a determination which our utmost efforts can scarce resist, or that we feel such determination under no other circumstances? If it be allowed that the natural man is irresistibly determined to imagine an apple when he hears its name or to expect thunder when he sees lightning, must it not also be allowed that he is irresistibly determined much earlier and in a much more impressive way when overmastered by the elements or by his enemies? But further, such instances bring to light what Hume's "determination" also implies, viz., its necessary correlative, effort or action. Even irresistible association can only be known as such by efforts to resist it. Hume allows this when he says that his principles of association "are not infallible causes; for one may fix his attention during some time on any one object without looking farther" (*op. cit.*, p. 393). But the fact is, we know both what it is to act and what it is to suffer, to go where we would and to be carried where we would not, quite apart from the workings of association. And, had Hume not confused the two different inquiries, that concerning the origin of the idea of causation and that concerning the ground of causal inference or law of causation, it could never have occurred to him to offer such an analysis of the former as he does.

Keeping to the former and simpler question, it would seem that when in ordinary thinking we say A causes this or that in B we project or analogically attribute to A what we experience in acting, and to B what we experience in being acted on; and the structure of language shows that such projection was made long before it was suspected that what A once did and B once suffered must happen in like manner again. The occasions suitable for this projection are determined by the temporal and spatial relations of the objects concerned, which relations are matter of intuition. These are of no very special interest from a psychological point of view, but the subjective elements we shall do well to consider further. First of all, we must note the distinction of immanent action and transitive action; the former is what we call action simply, and implies only a single thing, the agent; the latter, which we might with advantage call effectuation, implies two things, i.e., a patient distinct from the agent. In scientific language the agent in an intransitive act is called a *causa immanens* and so distinguished from the agent in effectuation or *causa transiens*. Common thought, however, does not regard mere action as caused at all; and we shall find it, in fact, impossible to resolve action into effectuation. But, since the things with which we ordinarily deal are complex, have many parts, properties, members, phases, and in consequence of the analytic procedure of thought, there ensues, indeed, a continual shifting of the point of view from which we regard any given thing, so that what is in one aspect one thing, is in another many (*comp. p. 56 c*). So it comes about that, when regarding himself as one, the natural man speaks of himself as walking, shouting, &c.; but, when distinguishing between himself and his members, he speaks of raising his voice, moving his legs, and so forth. Thus no sooner do we resolve any given action into an effectuation, by analytically distinguishing within the original agent an agent and a patient, than a new action appears. Action is thus a simpler notion than causation and inexplicable by means of it. It is certainly no easy problem in philosophy to determine where the resolution of the complex is to cease, at what point we must stop, because in the presence of an individual thing and a simple activity. At any rate, we reach such a point psychologically in the conscious subject, and that energy in consciousness we call attention. If this be allowed, Hume's critique of the notion of efficacy is really wide of the mark. "Some,"² he says, "have asserted that we feel an energy or power in our own mind; and that, having in this manner acquired the idea of power, we transfer that quality to matter, where we are not able immediately to discover it. . . . But to convince us how fallacious this reasoning is, we need only consider that the will, being here considered as a cause, has no more a discoverable connexion with its effects than any material cause has with its proper effect. . . . The effect is there [too] distinguishable and separable from the cause, and could not be foreseen without the experience of their constant conjunction" (*op. cit.*, p. 455). This is logical analysis, not psychological; the point is that the will is not considered as a cause and distinguished from its effects, nor in fact considered at

² Hume here has Locke and Berkeley specially in view. Locke as a patient and acute inquirer was incomparably better as a psychologist than a man addicted to literary foppery like Hume, for all his genius, could possibly be. On the particular question, see Locke, ii. 21. 3-5.

all. It is not a case of sequence between two separable impressions; for we cannot really make the indefinite regress that such logical distinctions as that between the conscious subject and its acts implies. Moreover, our activity as such is not directly presented at all: we *are*, being active; and further than this psychological analysis will not go. There are, as we have seen, two ways in which this activity is manifested, the receptive or passive and the motor or active in the stricter sense—(comp. p. 44) and our experience of these we project in predicating the causal relation. But two halves do not make a whole; so we have no complete experience of effectuation, for the simple reason that we cannot be two things at once. We are guided in piecing it together by the temporal and spatial relations of the things concerned. Hence, perhaps, some of the antinomies that beset this conception. In its earliest form, then, the so-called necessary connexion of cause and effect is perhaps nothing more than that of physical constraint. To this, no doubt, is added the strength of expectation—as Hume supposed—when the same effect has been found invariably to follow the same cause. Finally, when upon a basis of associated uniformities of sequence a definite intellectual elaboration of such material ensues, the logical necessity of reason and consequent finds a place, and so far as deduction is applicable cause and reason become interchangeable ideas.¹

Object-
ivity of
thought.

The mention of logical necessity brings up a topic already incidentally noticed, viz., the objectivity of thought and cognition generally (comp. pp. 55, 77). The psychological treatment of this topic is tantamount to an inquiry into the characteristics of the states of mind we call certainty, doubt, belief—all of which centre round the one fact of *evidence*. Between the certainty that a proposition is true and the certainty that it is not there may intervene continuous grades of uncertainty. We may know that A is sometimes B, or sometimes not; or that some at least of the conditions of B are present or absent; or the presentation of A may be too confused for distinct analysis. This is the region of probability, possibility, more or less obscurity. Leaving this aside, it will be enough to notice those cases in which certainty may be complete. With that certainty which is absolutely objective, *i.e.*, with knowledge, psychology has no direct concern; it is for logic to furnish the criteria by which knowledge is ascertained.

Emotion and desire are frequent indirect causes of subjective certainty, in so far as they determine the constituents and the grouping of the field of consciousness at the moment—"pack the jury" or "suborn the witnesses," as it were. But the ground of certainty is in all cases some quality or some relation of these presentations *inter se*. In a sense, therefore, the ground of all certainty is objective—in the sense, that is, of being something at least directly and immediately determined for the subject and not by it. But, though objective, this ground is not itself—at least is not ultimately—an object or presentation. Where certainty is mediate, one judgment is often spoken of as the ground of another; but a syllogism is still psychologically a single, though not a simple, judgment, and the certainty of it as a whole is immediate. Between the judgment A is B and the question Is A B? the difference is not one of content nor scarcely one of form: it is a difference which depends upon the effect of the proposition on the subject judging. (i.) We have this effect before us most clearly if we consider what is by common consent regarded as the type of certainty and evidence, the certainty of present sense-impressions whence it is said, "Seeing is believing." The evident is here the actual, and the "feeling or consciousness" of certainty is in this case nothing but the sense of being taken fast hold of and forced to apprehend what is there. (ii.) The like is true of memory and expectation: in these also there is a sense of being tied down to what is given, whereas in mere imagination, however lively, this non-voluntary determination is absent (comp. p. 63). Hume saw this at times clearly enough, as, *e.g.*, when he says, "An idea assented to *feels* different from a fictitious idea that the fancy alone presents to us." But unfortunately he not only made this difference a mere difference of intensity, but spoke of belief itself as "an operation of the mind" or "manner of conception that bestowed on our ideas this additional force or vivacity."² In short, Hume confounded one of the indirect causes of belief with the ground of it, and again, in describing this ground committed the *ὁρῶναι πρότερον* of making the mind determine the ideas instead of the ideas determine the mind. (iii.) In speaking of intellection he is clearer: "The answer is easy with regard to propositions that are prov'd by intuition or demonstration. In that case, the person who assents not only conceives the ideas according to the proposition, but is necessarily determin'd to conceive them in that particular manner" (*op. cit.*, p. 395). It has been often urged—as by J. S. Mill, for example—that belief is something "ultimate and primordial." No doubt it is; but so is the distinction between activity and passivity, and it is not here maintained that certainty can be analysed into something simpler, but only that it is identical with what is of the nature of passivity—

objective determination. As Dr Bain puts it, "The leading fact in belief . . . is our primitive credulity. We begin by believing everything: whatever is is true" (*Emotions and Will*, 3d ed., p. 511). But the point is that in this primitive state there is no act answering to "believe" distinct from the non-voluntary attention answering to "perceive," and no reflexion such as a modal term like "true" implies. With eyes open in the broad day no man says, "I am certain there is light": he simply sees. He may by and by come absolutely to disbelieve much that he sees—*e.g.*, that things are nearer when viewed through a telescope—just as he will come to disbelieve his dreams, though while they last he is certain in these too. The limits of this article forbid any attempt to deal specially with the intellectual aspects of such conflicts of presentations (comp. p. 62) or with their resolution and what is meant by saying that reason turns out superior to sense. The consistency we find it possible to establish among certain of our ideas becomes an ideal, to which we expect to find all our experience conform. Still the intuitive evidence of logical and mathematical axioms is psychologically but a new form of the actual; we are only certain that two and two make four and we are not less certain that we see things nearer through a telescope.³

Presentation of Self, Self-Consciousness, and Conduct.

The conception of self we have just seen underlying and to a great extent shaping the rest of our intellectual furniture; on this account it is at once desirable and difficult to analyse it and ascertain the conditions of its development.⁴ In attempting this we must carefully distinguish between the bare presentation of self and that reference of other presentations to it which is often called specially self-consciousness, "inner sense," or internal perception. Concerning all presentations whatever—that of self no less than the rest—it is possible to reflect, "This presentation is mine; it is my object; I am the subject attending to it." Self, then, is one presentation among others, the result, like them, of the differentiation of the original continuum. But it is obvious that this presentation must be in existence first before other presentations can be related to it. On the other hand, it is only in and by means of such relations that the conception of self is completed. We begin, therefore, with self simply as an object, and end with the conception of that object as the subject or "myself" that knows itself. Self has, in contradistinction from all other presentations, first of all (a) a unique interest and (b) a certain inwardness; (c) it is an individual that (d) persists, (e) is active, and finally (f) knows itself. These several characteristics of self are intimately involved; so far as they appear at all they advance in definiteness from the lowest level of mere sentience to those moments of highest self-consciousness in which conscience approves or condemns volition.

The earliest and to the last the most important element in self—Self and what we might perhaps term its root or material element—is that the body, variously styled the organic sensations, vital sense, *comæsthesis*, or somatic consciousness. This largely determines the tone of the

³ See BELIEF, vol. iii. p. 532.

⁴ A large, though certainly diminishing, school of thinkers would entirely demur to such a proposal. "This personality," says one, "like all other simple and immediate presentations, is indefinable . . . it can be analysed into no simpler elements; for it is revealed to us in all the clearness of an original intuition" (Mansel, *Metaphysics*, p. 182). Such an objection arises from that confusion between psychology and epistemology which we have met already several times before (as, *e.g.*, in the case of space, p. 53, and of unity, p. 79). The fact is that a conception that is logically "simple and immediate," in such wise as to be underrivable from others, and therefore indefinable, may be—we might almost say will be—psychologically the result of a long process of development; for the more abstract a concept is, *i.e.*, the more fundamental in epistemological structure, the more thinking there has been to elaborate it. The most complex integrations of experience are needed to furnish the ideas of its ultimate elements. Such ideas when reached have *intellectually* all the clearness of an original intuition, no doubt; but they are not therefore to be confounded with what is psychologically a simple and immediate presentation. It was in this last sense that idealists like Berkeley and Kant denied any presentation of self as much as sceptics like Hume. Self is psychologically a product of thought, not a datum of sense; hence, while Berkeley called it a "notion" and Kant an "idea of the reason," Hume treated it as a philosophical fiction.

¹ Comp. Wundt, *Logik*—"Das Causal-Gesetz und Satz vom Grunde," vol. i. p. 544.

² *Treatise of Human Nature*, Green and Grose's ed., i. p. 396.

special sensations and enters, though little suspected, into all our higher feelings. If, as sometimes happens in serious nervous affections, the whole body or any part of it should lose common sensibility, the whole body or that part is at once regarded as strange and even as hostile. In some forms of hypochondria, in which this extreme somatic insensibility and absence of zest leave the intellect and memory unaffected, the individual doubts his own existence or denies it altogether. Ribot cites the case of such a patient who, declaring that he had been dead for two years, thus expressed his perplexity:—"J'existe, mais en dehors de la vie réelle, matérielle, et, malgré moi, rien ne m'ayant donné la mort. Tout est mécanique chez moi et se fait inconsciemment."¹ It is not because they accompany physiological functions essential to the efficiency of the organism as an organism, but simply because they are the most immediate and most constant sources of feeling, that these massive but ill-defined organic sensations are from the first the objects of the directest and most unreflecting interest. Other objects have at the outset but a mediate interest through subjective selection in relation to these, and never become so instinctively and inseparably identified with self, never have the same inwardness. This brings us to a new point. As soon as definite perception begins, the body as an extended thing is distinguished from other bodies, and such organic sensations as can be localized at all are localized within it. At the same time the actions of other bodies upon it are accompanied by pleasures and pains, while their action upon each other is not. The body also is the only thing directly set in motion by the reactions of these feelings, the purpose of such movements being to bring near to it the things for which there is appetite and to remove from it those towards which there is aversion. It is thus not merely the type of occupied space and the centre from which all positions are reckoned, but it affords us an unfailing and ever-present intuition of the actually felt and living self, to which all other things are external, more or less distant, and at times absent altogether. The body then first of all gives to self a certain measure of individuality, permanence, and inwardness.

Inner
self.

But with the development of ideation there arises within this what we may call an inner zone of self, having still more unity and permanence. We have at this stage not only an intuition of the bodily self doing or suffering here and now, but also memories of what it has been and done under varied circumstances in the past. External impressions have by this time lost in novelty and become less absorbing, while the train of ideas, largely increased in number, distinctness, and mobility, diverts attention and often shuts out the things of sense altogether. In all such reminiscence or reverie a generic image of self is the centre, and every new image as it arises derives all its interest from relation to this; and so apart from bodily appetites new desires may be quickened and old emotions stirred again when all that is actually present is dull and unexciting. But desires and emotions, it must be remembered, though awakened by what is only imaginary, invariably entail actual organic perturbations, and with these the generic image of self comes to be intimately combined. Hence arises a contrast between the inner self, which the natural man locates in his breast or *phron*, the chief seat of these emotional disturbances, and the whole visible and tangible body besides. Although from their nature they do not admit of much ideal representation, yet, when actually present, these organic sensations exert a powerful and often irresistible influence over other ideas; they have each their appropriate train, and so heighten in the very complex and loosely compacted idea of self those traits they originally wrought into it, suppressing to an equal extent all the rest. Normally there is a certain equilibrium to which they return, and which, we may suppose, determines the so-called temperament, *naturel*, or disposition, thus securing some tolerable uniformity and continuity in the presentation of self. But even within the limits of sanity great and sudden changes of mood are possible, as, e.g., in hysterical persons or those of a "mercurial temperament," or among the lower animals at the onset of parental or migratory instincts. Beyond those limits—as the concomitant apparently of serious visceral derangements or the altered nutrition of parts of the nervous system itself—complete "alienation" may ensue. A new self may arise, not only distinct from the old and devoid of all save the most elementary knowledge and skill that the old possessed, but diametrically opposed to it in tastes and disposition,—obscurity, it may be, taking the place of modesty and cupidity or cowardice succeeding to generosity or courage. The most convincing illustrations of the psychological growth and structure of the presentation of self on the lower levels of sensation and ideation are furnished by these melancholy spectacles of minds diseased; but it is impossible to refer to them in detail here.

Self as a
person. Passing to the higher level of intellection, we come at length upon the concept which every intelligent being more or less distinctly forms of himself as a person, M. or N., having such and such a character, tastes, and convictions, such and such a history, and

such and such an aim in life. The main instrument in the formation of this concept, as of others, is language, and especially the social intercourse that language makes possible. Up to this point the presentation of self has shaped that of not-self,—that is to say, external things have been comprehended by the projection of its characteristics. But now the order is in a sense reversed: the individual advances to a fuller self-knowledge by comparing the self within with what is first discernible in other persons without. So far *avant l'homme est la société*; it is through the "us" that we learn of the "me" (comp. p. 75 note 1). Collective action for common ends is of the essence of society, and in taking counsel together for the good of his tribe each one learns also to take counsel with himself for his own good on the whole; with the idea of the common weal arises the idea of happiness as distinct from momentary gratification. The extra-regarding impulses are now confronted by a reasonable self-love, and in the deliberations that thus ensue activity attains to its highest forms, those of thought and volition. In the first we have a distinctly active manipulation of ideas as compared with the more passive spectacle of memory and imagination. Thereby emerges a contrast between the thinker and these objects of his thought, including among them the mere generic image of self, from which is now formed this conception of self as a person. A similar, even sharper, contrast also accompanies the exercise of what is very misleadingly termed "self-control," i.e., control by this personal self of "the various natural affections," to use Butler's phrase, which often hinder it as external objects hindered them. It is doubtful whether the reasoning, regulating self is commonly regarded as definitely localized. The effort of thinking and concentrating attention upon ideas is no doubt referred to the brain, but this is only comparable with the localization of other efforts in the limbs; when we think we commonly feel also, and the emotional basis is of all the most subjective and inalienable. If we speak of this latest phase of self as *par excellence* "the inner self" such language is then mainly figurative, inasmuch as the contrasts just described are contrasts into which spatial relations do not enter.

The term "reflexion" or internal perception is applied to that state Self-consciousness of mind in which some particular presentation or group of presentations (x or y) is not simply in the field of consciousness but there as necessarily and consciously related to self, which is also presented at the same time. Self here may be symbolized by M, to emphasize the fact that it is in like manner an object in the field of consciousness. The relation of the two is commonly expressed by saying, "This (x or y) is my (M's) percept, idea, or volition; I (M) it is that perceive, think, will it." Self-consciousness, in the narrowest sense, as when we say, "I know myself, I am conscious that I am," &c., is but a special, though the most important, instance of this internal perception: here self (M) is presented in relation to self (with a difference, M'); the subject itself—at least so we say—is or appears as its own object.

It has been often maintained that the difference between consciousness and reflexion is not a real difference, that to know and to know that you know are "the same thing considered in different aspects."² But different aspects of the same thing are *not* the same thing, for psychology at least. Not only is it not the same thing to feel and to know that you feel; but it might even be held to be a different thing still to know that you feel and to know that you know that you feel,—such being the difference perhaps between ordinary reflexion and psychological introspection.³ The difficulty of apprehending these facts and keeping them distinct seems obviously due to the necessary presence of the earlier along with the later; that is to say, we can never know that we feel without feeling. But the converse need not be true. How distinct the two states are is shown in one way by their notorious incompatibility, the direct consequence of the limitation of attention: whatever we have to do that is not altogether mechanical is ill done unless we lose ourselves in the doing of it. This mutual exclusiveness receives a further explanation from the fact so often used to discredit psychology, viz., that the so-called introspection and indeed all reflexion are really retrospective. It is not while we are angry or lost in reverie that we take note of such states, but afterwards, or by momentary side glances intercepting the main interest, if this be not too absorbing.

But we require an exacter analysis of the essential fact in this retrospect—the relation of the presentation x or y to that of self or M. What we have to deal with, it will be observed, is, implicitly at least, a judgment. First of all, then, it is noteworthy that we are never prompted to such judgments by every-day occurrences or acts of routine, but only by matters of interest, and, as said, gener-

² So—misled possibly by the confusions incident to a special faculty of reflexion, which they controvert—James Mill, *Analysis*, i. p. 224 sq. (corrected, however, by both his editors, pp. 227 and 230), and also Hamilton, *Lech.*, i. p. 192.

³ It has been thought a fatal objection to this view that it implies the possibility of an indefinite regress; but why should it not? We reach the limit of our experience in reflexion or at most in deliberate introspection, just as in space of three dimensions we reach the limit of our experience in another respect. But there is no absurdity in supposing a consciousness more evolved and explicit than our self-consciousness and advancing on it as it advances on that of the unreflecting brutes.

¹ "Bases affectives de la Personnalité," in *Revue philosophique*, xviii. p. 149.

ally when these are over or have ceased to be all-engrossing. Now in such cases it will be found that some effect of the preceding state of objective absorption persists, like wounds received in battle unnoticed till the fight is over,—such, e.g., as the weariness of muscular exertion or of long concentration of attention; some pleasurable or painful after-sensation passively experienced, or an emotional wave subsiding but not yet spent; “the jar of interrupted expectation,” or the relief of sudden attainment after arduous striving, making prominent the contrast of contentment and want in that particular; or, finally, the quiet retrospect and mental rumination in which we note what time has wrought upon us and either regret or approve what we were and did. All such presentations are of the class out of which, as we have seen, the presentation of self is built up, and so form in each case the concrete bond connecting the generic image of self with its object.¹ In this way and in this respect each is a concrete instance of what we call a state, act, affection, &c., and the judgments in which such relations to the standing presentation of self are recognized are the original and the type of all real predications (comp. p. 81). The opportunities for reflexion are at first few, the materials being as it were thrust upon attention, and the resulting “percepts” are but vague. By the time, however, that a clear conception of self has been attained the exigencies of life make it a frequent object of contemplation, and as the abstract of a series of instances of such definite self-consciousness we reach the purely formal notion of a subject or pure ego. For empirical psychology this notion is ultimate; its speculative treatment falls altogether—usually under the heading “rational psychology”—to metaphysics.

Conduct.

The growth of intellection and self-consciousness reacts powerfully upon the emotional and active side of mind. To describe the various sources of feeling and of desire that thus arise—æsthetic, social and religious sentiments, pride, ambition, selfishness, sympathy, &c.—is beyond the scope of systematic psychology and certainly quite beyond the limits of an article like the present.² But at least a general *resumé* of the characteristics of activity on this highest or rational level is indispensable. If we are to gain any oversight in a matter of such complexity it is of the first importance to keep steadily in view, as a fundamental principle, that as the causes of feeling become more complex, internal, and representative the consequent actions change in like manner. We have noted this connexion already in the case of the emergence of desires, and seen that desire in prompting to the search for means to its end is the *primum movens* of intellection (pp. 73-75). But intellect does much more than devise and contrive in unquestioning subservience to the impulse of the moment, like some demon of Eastern fable; even the brutes, whose cunning is on the whole of this sort, are not without traces of self-control. As motives conflict and the evils of hasty action recur to mind, deliberation succeeds to mere invention and design. In moments of leisure, the more imperious cravings being stilled, besides the rehearsal of failures or successes in the past, come longer and longer flights of imagination into the future. Both furnish material for intellectual rumination, and so we have at length (1) conceptions of general and distant ends, as wealth, power, knowledge, and—self-consciousness having arisen—the conception also of the happiness or perfection of self, and (2) maxims or practical generalizations as to the best means to these ends. Instead of actions determined by the *vis a tergo* of blind passion we have conduct shaped by what is literally prudence or foresight, the pursuit of ends that are not esteemed desirable till they are judged to be good. The good, it is truly urged, is not to be identified with the pleasant, for the one implies a standard and a judgment and the other nothing but a bare fact of feeling; thus the good is often not pleasant and the pleasant not good; in talking of the good, in short, we are passing out of the region of nature into that of character. It is so, and yet this progress is itself so far natural as to admit of psychological explication. As already urged (p. 72), the causes of feeling change as the constituents of consciousness change and depend more upon the form of that consciousness as that increases in complexity. When we can deliberately range to and fro in time and circumstances, the good that is not directly pleasant may indeed be preferred to what is only pleasant while attention is confined to the seen and sensible; but then the choice of such good is itself pleasant,—pleasanter than its rejection would have been. Freedom of will in the sense of absolute arbitrariness or “causeless volition,” then, is at least without support from experience. The immediate affirmation of self-consciousness

that in the moment of action we are free must be admitted indeed, but it does not prove what it is supposed to prove—the existence of a *liberum arbitrium indifferentiæ*—but only that the relation of the end approved to the empirical self as then presented was the determining motive. This freedom of this empirical self is in all cases a relative freedom; hence at a later time we often come to see that in some past act of choice we were not our true selves, not really free. Or perhaps we hold that we *were* free and could have acted otherwise; and this also is true if we suppose the place of the purely formal and abstract conception of self had been occupied by some other mood of that empirical self which is continuously, but at no one moment completely, presented. It must, however, be admitted that psychological analysis in such cases is not only actually incomplete but in one respect must necessarily always remain so; and that for the simple reason that all we discern by reflexion must ever be less than all we are. That empirical self that the subject sees and even fashions is after all only its object and workmanship, not itself. If this be so, the indeterminist position, that particular acts are not fully determined by aught in consciousness, can neither be certainly established nor finally overthrown on scientific grounds; but the presumption is against it. In another sense, however, it may be allowed that freedom is possible, if not actual, viz., as synonymous with self-rule or autonomy. Freedom applies not to the ultimate source of an activity but to execution; that man is free “externally” who can do what he pleases, and when we talk of internal freedom the same meaning holds.³

BIBLIOGRAPHY.—A. *Historical*.—There are few good works on the history of psychology; the only one in English (R. Blakey, *History of the Philosophy of Mind from the Earliest Period to the Present Time*, London, 1848) is said to be worthless. F. A. Carus's *Geschichte der Psychologie* (Leipzig, 1808) is at least useful for reference. A work bearing the same title by H. Siebeck, of which only the first part has yet appeared (consisting of two divisions—(i.) *Die Psychologie von Aristoteles*, (ii.) *Die Psychologie von Aristoteles bis zu Thomas von Aquino*, Gotha, 1880 and 1884) is thoroughly and carefully done. *Die Philosophie in ihrer Geschichte* (I. *Psychologie*), by the late Professor Harms (Berlin, 1878), is also good. Ribot's *La Psychologie Anglaise contemporaine* (2d ed., Paris, 1875) and *La Psychologie Allemande contemporaine* (Paris, 1879) are lucid and concise in style, though the latter work in places is superficial and inaccurate.

B. *Positive*.—The most useful and complete work as an introduction, and for the English reader, is Mr Sully's well-arranged and well-written *Outlines of Psychology* (2d ed., London, 1885). Of more advanced text-books the late Professor Volkman's *Lehrbuch der Psychologie* (2 vols., 3d ed., Köthen, 1885, edited by Cornelius) is a monument worthy the lifelong labours it entailed. Written in the main from a Herbartian standpoint, it is still the work of one who not only had read and thought over all that was worth reading by psychologists of every school but was unusually gifted with the qualities that make a good investigator and a good expositor. The importance of the Herbartian psychology to English students has been too long overlooked; while it has much in common with the English preference for empirical methods, it is in aim, if not in attainment, greatly in advance of English writers in exactness and system. Other excellent works of the same school are M. W. H. Drobisch's *Empirische Psychologie* (Leipzig, 1842), T. Waitz's *Lehrbuch der Psychologie als Naturwissenschaft* (Brunswick, 1849), and Steinthal's *Einführung in die Psychologie und Sprachwissenschaft* (Berlin, 1871). To the honoured name of Lotze belongs a distinguished place in any enumeration of recent productions in philosophy; his *Medizinische Psychologie* (Göttingen, 1852) is still valuable; but it is out of print and scarce. A large part of his *Mikrokosmos* (3 vols., 3d ed., 1876-80; translated into English, 2 vols., 1885) and one book of his *Metaphysik* (2d ed., 1884; also translated into English) are, however, devoted to psychology. The close connexion between the study of mind and the study of the organism has been more and more recognized as the present century has advanced, and the doctrine of evolution in particular has been as fruitful in this study as in other sciences that deal with life. In this respect Mr Herbert Spencer's *Principles of Psychology* (2 vols., 2d ed., 1870) and *Data of Ethics* (1879) occupy a foremost place. Dr Bain's standard volumes, *The Senses and the Intellect* (3d ed., 1873) and *The Emotions and the Will* (3d ed., 1875), contain a good deal of “physiological psychology,” but no adequate recognition of the importance of the modern theory of development; still, with the exception of Locke, perhaps no English writer has made equally important contributions to the science of mind. It is very questionable whether the time has yet come for a systematic treatment of the connexions of mind and body. Wundt's *Physiologische Psychologie* (2 vols., 2d ed., 1880) is rather a physiology added to a psychology than an attempt at such a systematic treatment. It is, however, a thoroughly able work by one who is both a good psychologist and a good physiologist. (J. W*.)

PSYCHOPHYSICS. See WEBER'S LAW.

³ See ERRORS, to which these questions more fitly belong.

¹ They have thus a certain analogy to the presentative element in external perception, the re-presentative elements being furnished by the rest of the generic image of self. But, as this generic image is combined with and primarily sustained by a continuous stream of organic sensations, the analogy is not very exact.

² The psychology of a century or so ago, like the biology of the same period, was largely of the “natural history” type and was much occupied with such descriptions; writers like Dugald Stewart, Brown, and Abercrombie, e.g., draw freely from biography (and even from fiction) illustrations of the popularly received mental faculties and affections. A very complete and competent handling of the various emotions and springs of action will be found in Bain, *The Emotions and the Will*; Nahlowsky, *Das Gefühlleben*, 2d ed., 1884, is also good.

PTARMIGAN. See GROUSE, vol. xi. p. 222.

PTERODACTYLE. The extinct flying reptiles known as "pterodactyles" are among the most aberrant forms of animals, either living or extinct. Since the beginning of this century, when Blumenbach and Cuvier first described the remains of these curious creatures, they have occupied the attention of naturalists, and various opinions have been expressed as to their natural affinities. The general proportions of their bodies (excepting the larger head and neck) and the modification of the forelimb, to support a membrane for flight, remind one strongly of the bats, but the resemblance is only superficial; a closer inspection shows that their affinities are rather with reptiles and birds.

In all pterodactyles the head, neck, and forelimb are large in proportion to the other parts of the body (fig. 1). The skull is remarkably avian, and even the teeth, which

terminate of the vertebra next in front of it. The eight or nine cervical vertebrae are always large, and are succeeded by about fourteen or sixteen which bear ribs. Probably there are no vertebrae which can be called lumbar. The sacrum consists of from three to six vertebrae. The tail is short in some genera and very long in others. The sternum has a distinct median crest, and the scapula and coracoid are also much like those of carinate birds. The humerus has a strong ridge for the attachment of the pectoral muscle, and the radius and ulna are separate bones. There are four distinct metacarpals; passing from the inner or radial side, the first three of these bear respectively two, three, and four phalanges, the terminal ones having had

FIG. 1.—*Pterodactylus spectabilis*, Von Meyer, natural size, from the lithographic slate. *h*, humerus; *ru*, radius and ulna; *mc*, metacarpals; *pt*, pteroid bone; 2, 3, 4, digits with claws; 5, elongated digit for support of wing membrane; *st*, sternum, crest not shown; *is*, ischium; *pp*, prepubis. The teeth are not shown.

most of them possess, and which seem so unbird-like, are paralleled in the Cretaceous toothed birds of North America. Judging from the form of the skull, the brain was small, but rounded and more like that of a bird than that of a reptile. The position of the occipital condyle, beneath and not at the back of the skull, is another character pointing in the same direction. The nasal opening is not far in advance of the large orbit, and in some forms there is a lachrymo-nasal fossa between them. The pre-maxillae are large, while the maxillae are slender. In certain species the extremities of the upper and lower jaws seem to have been covered with horn, and some forms at least had bony plates around the eye. The union of the post-frontal bone with the squamosal to form a supra-temporal fossa is a reptilian character. Both jaws are usually provided with long slender teeth, but they are not always present. The vertebral column may be divided into cervical, dorsal, sacral, and caudal regions. The centra of the vertebrae are procelous,—that is, the front of each centrum is cup-like and receives the ball-like hinder ex-

claws. The phalanges of the outermost digit are much elongated, and except in one doubtful form are always four in number. It is the extreme elongation of this outer digit, for the support of the patagium, which is the most characteristic feature of the pterodactyle's organization. A slender bone called the "pteroid" is sometimes seen extending from the carpal region in the direction of the upper part of the humerus. Some naturalists look upon the pteroid merely as an ossification of a tendon, corresponding with one which is found in this position in birds, while others are inclined to regard it rather as a rudimentary first digit, modified to support the edge of the patagium. The pelvis is small. In form the ilia resemble rather the ornithic than the reptilian type; but the other portions of the pelvis are more like those of the crocodiles. The hind

limb is small, and the fibula seems to have been feebly developed and fixed to the tibia. The hind foot has five digits in some forms, but only four in others. In the latter case the number of phalanges to each digit, counting from the tibial side, is two, three, four, five respectively. The long bones and vertebræ, as well as some parts of the skull, contained large pneumatic cavities similar to those found in birds. There can be little doubt that the pterodactyles had the power of sustained flight. The large size of the sternal crest indicates a similar development of the pectoral muscles and a corresponding strength in the arms. The form of the forelimb, especially its outer digit, indicates in no uncertain manner that it supported a flying membrane; but within the last few years this has been more clearly demonstrated by the discovery of a specimen in the Solenhofen slates with the membrane preserved (fig. 2). The occurrence of pterodactyle remains in marine deposits would seem to indicate that they frequented the seashore; and it is tolerably certain that those forms with long and slender teeth were, in part at least, fish-eaters. Seeing, however, that the armature of the jaws varies considerably in the different genera, it is most likely that their diet varied accordingly.

Pterodactyles present so many avian peculiarities that it has been proposed to place them in a special group, to be called *Ornithosauria*, which would hold a position intermediate between *Aves* and *Reptilia*. On the other hand, pterodactyles are thought by most authorities to have a closer relationship with the reptiles, and the different genera are placed in a separate order of the *Reptilia* called *Pterosauria*. The most important genera are five. (1) *Pterodactylus*; these have the jaws pointed and toothed to their extremities, and the tail very short. (2) *Rhamphorhynchus* (fig. 2); this genus has the jaws provided with slender teeth, but the extremities of both mandible and upper jaw are produced into toothless beaks, which were probably covered with horn; the tail is extremely long. (3) *Dimorphodon*; in this form the anterior teeth in both upper and lower jaws are long, but those at the hinder part of the jaws are short; the tail is extremely long. (4) *Pteranodon*; similar in most respects to *Pterodactylus*, but the jaws are devoid of teeth. In these four genera the outer digit of the manus has four phalanges. (5) *Ornithopterus*; this form is said to have only two phalanges in the outer digit of the manus; the genus, however, is very imperfectly known, and it has been suggested that it may perhaps be a true bird.

The *Pterosauria* are only known to have lived during the Mesozoic period. They are first met with in the Lower Lias, the *Dimorphodon macronyx* from Lyme Regis being perhaps the earliest known species. The Jurassic slates of Solenhofen have yielded a large number of beautifully preserved examples of *Pterodactylus* and *Rhamphorhynchus*, and remains of the same genera have been found in England in the Stonesfield slate. Bones of pterodactyles have also been obtained in some abundance from the Cretaceous phosphatic deposits near Cambridge; and their remains have been met with occasionally in the Wealden and Chalk of Kent. The genus *Pteranodon* is only known from the Upper Cretaceous rocks of North America. The *Pterosauria* were for the most part of moderate or small size (see fig. 1), but some attained to very considerable dimensions; for instance, *Rhamphorhynchus Bucklandi* from the Stonesfield slate probably measured 7 feet between the wing-tips. But the largest forms existed apparently towards the close of the Mesozoic period, the pterodactyles of the British Cretaceous rocks and the American *Pteranodon* being of still larger size; some of them, it is calculated, must have had wings at least 20 feet in extent.

See Buckland, *Bridgewater Treatise*, 1836; Cuvier, *Ossements fossiles*, vol. v. pt. 2, p. 359 (1824); Huxley, "On *Rhamphorhynchus Bucklandi*," in *Quart. Journ. Geol. Soc.*, vol. xv. p. 658 (1859), and *Anatomy of Vertebrated Animals* (1871), p. 266; Marsh, "Notice of New Sub-order of *Pterosauria* (*Pteranodon*)," *Amer. Journ. Sci. and Art*, vol. xi. p. 507 (1876), and on the "Wings of Pterodactyles," in *Amer. Journ. Science*, vol. xxiii. p. 251 (1882); Owen, *Paleontographical Society* (1851, 1859, 1860); Seeley, *Ornithosauria* (1870); Von Meyer, *Reptilien aus dem Lithograph. PTOLEMIES, the Macedonian dynasty of sovereigns of Egypt. See EGYPT, vol. vii. pp. 745-748, and MACEDONIAN EMPIRE, vol. xv. p. 144.

PTOLEMY (CLAUDIUS PTOLEMÆUS), celebrated as a mathematician, astronomer, and geographer. He was a native of Egypt, but there is an uncertainty as to the place of his birth; some ancient manuscripts of his works describe him as of Pelusium, but Theodorus Meliteniota, a Greek writer on astronomy of the 12th century, says that he was

born at Ptolemais Hermii, a Grecian city of the Thebaid. It is certain that he observed at Alexandria during the reigns of Hadrian and Antoninus Pius, and that he survived Antoninus. Olympiodorus, a philosopher of the Neoplatonic school who lived in the reign of the emperor Justinian, relates in his scholia on the *Phædo* of Plato that Ptolemy devoted his life to astronomy and lived for forty years in the so-called *Πρεπὰ τοῦ Κανόβου*, probably elevated terraces of the temple of Serapis at Canopus near Alexandria, where they raised pillars with the results of his astronomical discoveries engraved upon them. This statement is probably correct; we have indeed the direct evidence of Ptolemy himself that he made astronomical observations during a long series of years; his first recorded observation was made in the eleventh year of Hadrian, 127 A.D.,¹ and his last in the fourteenth year of Antoninus, 151 A.D. Ptolemy, moreover, says, "We make our observations in the parallel of Alexandria." St Isidore of Seville asserts that he was of the royal race of the Ptolemies, and even calls him king of Alexandria; this assertion has been followed by others, but there is no ground for their opinion. Indeed Fabricius shows by numerous instances that the name Ptolemy was common in Egypt. Weidler, from whom this is taken, also tells us that according to Arabian tradition Ptolemy lived to the age of seventy-eight years; from the same source some description of his personal appearance has been handed down, which is generally considered as not trustworthy, but which may be seen in Weidler, *Historia Astronomiæ*, p. 177, or in the preface to Halma's edition of the *Almagest*, p. lxi. Ptolemy's work as a geographer is treated of below (p. 91 *sq.*), and an account of the discoveries in astronomy of Hipparchus and Ptolemy has been given in the article ASTRONOMY. Their contributions to pure mathematics have not yet been noticed in the present work. Of these the chief is the foundation of trigonometry, plane and spherical, including the formation of a table of chords, which served the same purpose as our table of sines. This branch of mathematics was created by Hipparchus for the use of astronomers, and its exposition was given by Ptolemy in a form so perfect that for 1400 years it was not surpassed. In this respect it may be compared with the doctrine as to the motion of the heavenly bodies so well known as the Ptolemaic system, which was paramount for about the same period of time. There is, however, this difference, that, whereas the Ptolemaic system was then overthrown, the theorems of Hipparchus and Ptolemy, on the other hand, will be, as Delambre says, for ever the basis of trigonometry. The astronomical and trigonometrical systems are contained in the great work of Ptolemy *Ἡ μαθηματικὴ σύνταξις*, or, as Fabricius after Syncellus writes it, *Μεγάλη σύνταξις τῆς ἀστρονομίας*; and in like manner Suidas says οὗτος [Πτολ.] ἔγραψε τὸν μέγαν ἀστρονόμον ἥτοι σύνταξιν. The *Syntaxis* of Ptolemy was called *Ὁ μέγας ἀστρονόμος* to distinguish it from another collection called *Ὁ μικρὸς ἀστρονόμος*, also highly esteemed by the Alexandrian school, which contained some works of Autolycus, Euclid, Aristarchus, Theodosius of Tripolis, Hypsicles, and Menelaus. To designate the great work of Ptolemy the Arabs used the superlative *μεγίστη*, from which, the article *al* being prefixed, the hybrid name *Almagest*, by which it is now universally known, is derived.

We proceed now to consider the trigonometrical work of Hipparchus and Ptolemy. In the ninth chapter of the first book of the *Almagest* Ptolemy shows how to form a table of chords. He supposes the circumference divided into 360 equal parts (*τμήματα*), and then bisects each of these parts. Further, he divides the diameter

¹ Weidler and Halma give the ninth year; in the account of the eclipse of the moon in that year Ptolemy, however, does not say, as in other similar cases, he had observed, but it had been observed (*Almagest*, iv. 9).

into 120 equal parts, and then for the subdivisions of these he employs the sexagesimal method as most convenient in practice, *i.e.*, he divides each of the sixty parts of the radius into sixty equal parts, and each of these parts he further subdivides into sixty equal parts. In the Latin translation these subdivisions become "partes minutæ primæ" and "partes minutæ secundæ," whence our "minutes" and "seconds" have arisen. It must not be supposed, however, that these sexagesimal divisions are due to Ptolemy; they must have been familiar to his predecessors, and were handed down from the Chaldeans. Nor did the formation of the table of chords originate with Ptolemy; indeed, Theon of Alexandria, the father of Hypatia, who lived in the reign of Theodosius, in his commentary on the *Almagest* says expressly that Hipparchus had already given the doctrine of chords inscribed in a circle in twelve books, and that Menelaus had done the same in six books, but, he continues, every one must be astonished at the ease with which Ptolemy, by means of a few simple theorems, has found their values; hence it is inferred that the method of calculation in the *Almagest* is Ptolemy's own.

As starting-point the values of certain chords in terms of the diameter were already known, or could be easily found by means of the *Elements* of Euclid. Thus the side of the hexagon, or the chord of 60°, is equal to the radius, and therefore contains sixty parts. The side of the decagon, or the chord of 36°, is the greater segment of the radius cut in extreme and mean ratio, and therefore contains approximately 37° 4' 55" parts, of which the diameter contains 120 parts. Further, the square on the side of the regular pentagon is equal to the sum of the squares on the sides of the regular hexagon and of the regular decagon, all being inscribed in the same circle (Eucl. XIII. 10); the chord of 72° can therefore be calculated, and contains approximately 70° 32' 3". In like manner, the square on the chord of 90°, which is the side of the inscribed square, is twice the square on the radius; and the square on the chord of 120°, or the side of the equilateral triangle, is three times the square on the radius; these chords can thus be calculated approximately. Further, from the values of all these chords we can calculate at once the chords of the arcs which are their supplements.

This being laid down, we now proceed to give Ptolemy's exposition of the mode of obtaining his table of chords, which is a piece of geometry of great elegance, and is indeed, as De Morgan says, "one of the most beautiful in the Greek writers."

He takes as basis and sets forth as a lemma the well-known theorem, which is called after him, concerning a quadrilateral inscribed in a circle: The rectangle under the diagonals is equal to the sum of the rectangles under the opposite sides. By means of this theorem the chord of the sum or of the difference of two arcs whose chords are given can be easily found, for we have only to draw a diameter from the common vertex of the two arcs the chord of whose sum or difference is required, and complete the quadrilateral; in one case a diagonal, in the other one of the sides is a diameter of the circle. The relations thus obtained are equivalent to the fundamental formulæ of our trigonometry—

$$\begin{aligned}\sin(A+B) &= \sin A \cos B + \cos A \sin B, \\ \sin(A-B) &= \sin A \cos B - \cos A \sin B,\end{aligned}$$

which can therefore be established in this simple way.

Ptolemy then gives a geometrical construction for finding the chord of half an arc from the chord of the arc itself. By means of the foregoing theorems, since we know the chords of 72° and of 60°, we can find the chord of 12°; we can then find the chords of 6°, 3°, 1½°, and three-fourths of 1°, and lastly, the chords of 4½°, 7½°, 9°, 10½°, &c.,—all those arcs, namely, as Ptolemy says, which being doubled are divisible by 3. Performing the calculations, he finds that the chord of 1½° contains approximately 1° 34' 55", and the chord of three-fourths of 1° contains 0° 47' 8". A table of chords of arcs increasing by 1½° can thus be formed; but this is not sufficient for Ptolemy's purpose, which was to frame a table of chords increasing by half a degree. This could be effected if he knew the chord of one-half of 1°; but, since this chord cannot be found geometrically from the chord of 1½°, inasmuch as that would come to the trisection of an angle, he proceeds to seek in the first place the chord of 1°, which he finds approximately by means of a lemma of great elegance, due probably to Apollonius. It is as follows: If two unequal chords be inscribed in a circle, the greater will be to the less in a less ratio than the arc described on the greater will be to the arc described on the less. Having proved this theorem, he proceeds to employ it in order to find approximately the chord of 1°, which he does in the following manner—

$$\begin{aligned}\frac{\text{chord } 60'}{60} &< \frac{\text{chord } 45'}{45}, \text{ i.e., } < \frac{4}{3}, \therefore \text{chord } 1^\circ < \frac{4}{3} \text{ chord } 45';\end{aligned}$$

again—

$$\begin{aligned}\frac{\text{chord } 90'}{90} &< \frac{\text{chord } 60'}{60}, \text{ i.e., } < \frac{3}{2}, \therefore \text{chord } 1^\circ > \frac{2}{3} \text{ chord } 90'.$$

For brevity we use modern notation. It has been shown that the chord of 45' is 0° 47' 8" q.p., and the chord of 90' is 1° 34' 15" q.p.; hence it follows that approximately

$$\text{chord } 1^\circ < 1^\circ 2' 50'' 40''' \text{ and } > 1^\circ 2' 50''.$$

Since these values agree as far as the seconds, Ptolemy takes 1° 2' 50"

as the approximate value of the chord of 1°. The chord of 1° being thus known, he finds the chord of one-half of a degree, the approximate value of which is 0° 31' 25", and he is at once in a position to complete his table of chords for arcs increasing by half a degree. Ptolemy then gives his table of chords, which is arranged in three columns; in the first he has entered the arcs, increasing by half-degrees, from 0° to 180°; in the second he gives the values of the chords of these arcs in parts of which the diameter contains 120, the subdivisions being sexagesimal; and in the third he has inserted the thirtieth parts of the differences of these chords for each half-degree, in order that the chords of the intermediate arcs, which do not occur in the table, may be calculated, it being assumed that the increment of the chords of arcs within the table for each interval of 30' is proportional to the increment of the arc.¹

Trigonometry, we have seen, was created by Hipparchus for the use of astronomers. Now, since spherical trigonometry is directly applicable to astronomy, it is not surprising that its development was prior to that of plane trigonometry. It is the subject-matter of the eleventh chapter of the *Almagest*, whilst the solution of plane triangles is not treated separately in that work.

To resolve a plane triangle the Greeks supposed it to be inscribed in a circle; they must therefore have known the theorem—which is the basis of this branch of trigonometry—The sides of a triangle are proportional to the chords of the double arcs which measure the angles opposite to those sides. In the case of a right-angled triangle this theorem, together with Eucl. I. 32 and 47, gives the complete solution. Other triangles were resolved into right-angled triangles by drawing the perpendicular from a vertex on the opposite side. In one place (*Alm.*, vi. c. 7; vol. i. p. 422, ed. Halma) Ptolemy solves a triangle in which the three sides are given by finding the segments of a side made by the perpendicular on it from the opposite vertex. It should be noticed also that the eleventh chapter of the first book of the *Almagest* contains incidentally some theorems and problems in plane trigonometry. The problems which are met with correspond to the following: Divide a given arc into two parts so that the chords of the doubles of those arcs shall have a given ratio; the same problem for external section. Lastly, it may be mentioned that Ptolemy (*Alm.*, vi. 7; vol. i. p. 421, ed. Halma) takes 3° 8' 30", *i.e.*, $3 + \frac{8}{60} + \frac{30}{3600} = 3.141\bar{6}$, as the value of the ratio of the circumference to the diameter of a circle, and adds that, as had been shown by Archimedes, it lies between 3½ and 3⅔.

The foundation of spherical trigonometry is laid in chapter xi. on a few simple and useful lemmas. The starting-point is the well-known theorem of plane geometry concerning the segments of the sides of a triangle made by a transversal: The segments of any side are in a ratio compounded of the ratios of the segments of the other two sides. This theorem, as well as that concerning the inscribed quadrilateral, was called after Ptolemy—naturally, indeed, since no reference to its source occurs in the *Almagest*. This error was corrected by Mersenne, who showed that it was known to Menelaus, an astronomer and geometer who lived in the reign of the emperor Trajan. The theorem now bears the name of Menelaus, though most probably it came down from Hipparchus; Chasles, indeed, thinks that Hipparchus deduced the property of the spherical triangle from that of the plane triangle, but throws the origin of the latter further back and attributes it to Euclid, suggesting that it was given in his *Porisms*.² Carnot made this theorem the basis of his theory of transversals in his essay on that subject. It should be noticed that the theorem is not given in the *Almagest* in the general manner stated above; Ptolemy considers two cases only of the theorem, and Theon, in his commentary on the *Almagest*, has added two more cases. The proofs, however, are general. Ptolemy then lays down two lemmas: If the chord of an arc of a circle be cut in any ratio and a diameter be drawn through the point of section, the diameter will cut the arc into two parts the chords of whose doubles are in the same ratio as the segments of the chord; and a similar theorem in the case when the chord is cut externally in any ratio. By means of these two lemmas Ptolemy deduces in an ingenious manner—easy to follow, but difficult to discover—from the theorem of Menelaus for a plane triangle the corresponding theorem for a spherical triangle: If the sides of a spherical triangle be cut by an arc of a great circle, the chords of the doubles of the segments of any one side will be to each other in a ratio compounded of the ratios of the chords of the doubles of the segments of the other two sides. Here, too, the theorem is not stated generally; two cases only are considered, corresponding to the two cases given *in plano*. Theon has added two cases. The proofs are general. By means of this theorem four of Napier's formulæ for the solution of right-angled spherical triangles can be easily

¹ Ideler has examined the degree of accuracy of the numbers in these tables and finds that they are correct to five places of decimals.

² On the theorem of Menelaus and the rule of six quantities, see Chasles, *Aperçu Historique sur l'Origine et Développement des Méthodes en Géométrie*, vi. p. 291.

established. Ptolemy does not give them, but in each case when required applies the theorem of Menelaus for spherics directly. This greatly increases the length of his demonstrations, which the modern reader finds still more cumbrous, inasmuch as in each case it was necessary to express the relation in terms of chords—the equivalents of sines—only, cosines and tangents being of later invention.

Such, then, was the trigonometry of the Greeks. Mathematics, indeed, has ever been, as it were, the handmaid of astronomy, and many important methods of the former arose from the needs of the latter. Moreover, by the foundation of trigonometry, astronomy attained its final general constitution, in which calculations took the place of diagrams, as these latter had been at an earlier period substituted for mechanical apparatus in solving the ordinary problems.¹ Further, we find in the application of trigonometry to astronomy frequent examples and even a systematic use of the method of approximations,—the basis, in fact, of all application of mathematics to practical questions. There was a disinclination on the part of the Greek geometer to be satisfied with a mere approximation, were it ever so close; and the unscientific *agrimensor* shirked the labour involved in acquiring the knowledge which was indispensable for learning trigonometrical calculations. Thus the development of the calculus of approximations fell to the lot of the astronomer, who was both scientific and practical.²

We now proceed to notice briefly the contents of the *Almagest*. It is divided into thirteen books. The first book, which may be regarded as introductory to the whole work, opens with a short preface, in which Ptolemy, after some observations on the distinction between theory and practice, gives Aristotle's division of the sciences and remarks on the certainty of mathematical knowledge, "inasmuch as the demonstrations in it proceed by the incontrovertible ways of arithmetic and geometry." He concludes his preface with the statement that he will make use of the discoveries of his predecessors, and relate briefly all that has been sufficiently explained by the ancients, but that he will treat with more care and development whatever has not been well understood or fully treated. Ptolemy unfortunately does not always bear this in mind, and it is sometimes difficult to distinguish what is due to him from that which he has borrowed from his predecessors.

Ptolemy then, in the first chapter, presupposing some preliminary notions on the part of the reader, announces that he will treat in order—what is the relation of the earth to the heavens, what is the position of the oblique circle (the ecliptic), and the situation of the inhabited parts of the earth; that he will point out the differences of climates; that he will then pass on to the consideration of the motion of the sun and moon, without which one cannot have a just theory of the stars; lastly, that he will consider the sphere of the fixed stars and then the theory of the five stars called "planets." All these things—i.e., the phenomena of the heavenly bodies—he says he will endeavour to explain in taking for principle that which is evident, real, and certain, in resting everywhere on the surest observations and applying geometrical methods. He then enters on a summary exposition of the general principles on which his *Syntaxis* is based, and adduces arguments to show that the heaven is of a spherical form and that it moves after the manner of a sphere, that the earth also is of a form which is sensibly spherical, that the earth is in the centre of the heavens, that it is but a point in comparison with the distances of the stars, and that it has not any motion of translation. With respect to the revolution of the earth round its axis, which he says some have held, Ptolemy, while admitting that this supposition renders the explanation of the phenomena of the heavens much more simple, yet regards it as altogether ridiculous. Lastly, he lays down that there are two principal and different motions in the heavens—one by which all the stars are carried from east to west uniformly about the poles of the equator; the other, which is peculiar to some of the stars, is in a contrary direction to the former motion and takes place round different poles. These preliminary notions, which are all older than Ptolemy, form the subjects of the second and following chapters. He next proceeds to the construction of his table of chords, of which we have given an account, and which is indispensable to practical astronomy. The employment of this table presupposes the evaluation of the obliquity of the ecliptic, the knowledge of which is indeed the foundation of all astronomical science. Ptolemy in the next chapter indicates two means of determining this angle by observation, describes the instruments he employed for that purpose, and finds the same value which had already been found

by Eratosthenes and used by Hipparchus. This "is followed by spherical geometry and trigonometry enough for the determination of the connexion between the sun's right ascension, declination, and longitude, and for the formation of a table of declinations to each degree of longitude. Delambre says he found both this and the table of chords very exact."³

In book ii., after some remarks on the situation of the habitable parts of the earth, Ptolemy proceeds to make deductions from the principles established in the preceding book, which he does by means of the theorem of Menelaus. The length of the longest day being given, he shows how to determine the arcs of the horizon intercepted between the equator and the ecliptic—the amplitude of the eastern point of the ecliptic at the solstice—for different degrees of obliquity of the sphere; hence he finds the height of the pole and reciprocally. From the same data he shows how to find at what places and times the sun becomes vertical and how to calculate the ratios of gnomons to their equinoctial and solstitial shadows at noon and conversely, pointing out, however, that the latter method is wanting in precision. All these matters he considers fully and works out in detail for the parallel of Rhodes. Theon gives us three reasons for the selection of that parallel by Ptolemy: the first is that the height of the pole at Rhodes is 36°, a whole number, whereas at Alexandria he believed it to be 30° 58'; the second is that Hipparchus had made at Rhodes many observations; the third is that the climate of Rhodes holds the mean place of the seven climates subsequently described. Delambre suspects a fourth reason, which he thinks is the true one, that Ptolemy had taken his examples from the works of Hipparchus, who observed at Rhodes and had made these calculations for the place where he lived. In chapter vi. Ptolemy gives an exposition of the most important properties of each parallel, commencing with the equator, which he considers as the southern limit of the habitable quarter of the earth. For each parallel or climate, which is determined by the length of the longest day, he gives the latitude, a principal place on the parallel, and the lengths of the shadows of the gnomon at the solstices and equinox. In the next chapter he enters into particulars and inquires what are the arcs of the equator which cross the horizon at the same time as given arcs of the ecliptic, or, which comes to the same thing, the time which a given arc of the ecliptic takes to cross the horizon of a given place. He arrives at a formula for calculating ascensional differences and gives tables of ascensions arranged by 10° of longitude for the different climates from the equator to that where the longest day is seventeen hours. He then shows the use of these tables in the investigation of the length of the day for a given climate, of the manner of reducing temporal⁴ to equinoctial hours and *vice versa*, and of the nonagesimal point and the point of orientation of the ecliptic. In the following chapters of this book he determines the angles formed by the intersections of the ecliptic—first with the meridian, then with the horizon, and lastly with the vertical circle—and concludes by giving tables of the angles and arcs formed by the intersection of these circles, for the seven climates, from the parallel of Meroe (thirteen hours) to that of the mouth of the Borysthenes (sixteen hours). These tables, he adds, should be completed by the situation of the chief towns in all countries according to their latitudes and longitudes; this he promises to do in a separate treatise and has in fact done in his *Geography*.

Book iii. treats of the motion of the sun and of the length of the year. In order to understand the difficulties of this question Ptolemy says one should read the books of the ancients, and especially those of Hipparchus, whom he praises "as a lover of labour and a lover of truth" (*ἀνδρὶ φιλοπόνῳ τε ἰσχυρῶ καὶ φιλαληθείᾳ*). He begins by telling us how Hipparchus was led to discover the precession of the equinoxes; he relates the observations which led Hipparchus to his second great discovery, that of the eccentricity of the solar orbit, and gives the hypothesis of the eccentric by which he explained the inequality of the sun's motion. Ptolemy concludes this book by giving a clear exposition of the circumstances on which the equation of time depends. All this the reader will find in the article *ASTRONOMY* (vol. ii. p. 750). Ptolemy, moreover, applies Apollonius's hypothesis of the epicycle to explain the inequality of the sun's motion, and shows that it leads to the same results as the hypothesis of the eccentric. He prefers the latter hypothesis as more simple, requiring only one and not two motions, and as equally fit to clear up the difficulties. In the second chapter there are some general remarks to which attention should be directed. We find the principle laid down that for the explanation of phenomena one should adopt the simplest hypothesis that it is possible to establish, provided that it is not contradicted by the observations in any important respect.⁵ This fine principle,

³ De Morgan, in Smith's *Dictionary of Greek and Roman Biography*, s.v. "Ptolemæus, Claudius."

⁴ *Καιρικά*, temporal or variable. These hours varied in length with the seasons; they were used in ancient times and arose from the division of the natural day (from sunrise to sunset) into twelve parts.

⁵ *Alm.*, ed. Halma, i. 159.

² Cantor, *Vorlesungen über Geschichte der Mathematik*, p. 356.

which is of universal application, may, we think—regard being paid to its place in the *Almagest*—be justly attributed to Hipparchus. It is the first law of the “*philosophia prima*” of Comte.¹ We find in the same page another principle, or rather practical injunction, that in investigations founded on observations where great delicacy is required we should select those made at considerable intervals of time in order that the errors arising from the imperfection which is inherent in all observations, even in those made with the greatest care, may be lessened by being distributed over a large number of years. In the same chapter we find also the principle laid down that the object of mathematicians ought to be to represent all the celestial phenomena by uniform and circular motions. This principle is stated by Ptolemy in the manner which is unfortunately too common with him,—that is to say, he does not give the least indication whence he derived it. We know, however, from Simplicius, on the authority of Sosigenes,² that Plato is said to have proposed the following problem to astronomers: “What regular and determined motions being assumed would fully account for the phenomena of the motions of the planetary bodies?” We know, too, from the same source that Eudemos says in the second book of his *History of Astronomy* that “Eudoxus of Cnidus was the first of the Greeks to take in hand hypotheses of this kind,”³ that he was in fact the first Greek astronomer who proposed a geometrical hypothesis for explaining the periodic motions of the planets—the famous system of concentric spheres. It thus appears that the principle laid down here by Ptolemy can be traced to Eudoxus and Plato; and it is probable that they derived it from the same source, namely, Archytas and the Pythagoreans. We have indeed the direct testimony of Geminus of Rhodes that the Pythagoreans endeavoured to explain the phenomena of the heavens by uniform and circular motions.⁴

Books iv., v. are devoted to the motions of the moon, which are very complicated; the moon in fact, though the nearest to us of all the heavenly bodies, has always been the one which has given the greatest trouble to astronomers.⁵ Book iv., in which Ptolemy follows Hipparchus, treats of the first and principal inequality of the moon, which quite corresponds to the inequality of the sun treated of in the third book. As to the observations which should be employed for the investigation of the motion of the moon, Ptolemy tells us that lunar eclipses should be preferred, inasmuch as they give the moon's place without any error on the score of parallax. The first thing to be determined is the time of the moon's revolution; Hipparchus, by comparing the observations of the Chaldeans with his own, discovered that the shortest period in which the lunar eclipses return in the same order was 126,007 days and 1 hour. In this period he finds 4267 lunations, 4573 restitutions of anomaly, and 4612 tropical revolutions of the moon, less $7\frac{1}{2}$ ° q.p.; this quantity ($7\frac{1}{2}$ °) is also wanting to complete the 345 revolutions which the sun makes in the same time with respect to the fixed stars. He concluded from this that the lunar month contains 29 days and 31' 50" 8''' 20'''' of a day, very nearly, or 29 days 12 hours 44' 3" 20'''. These results are of the highest importance. (See *ASTRONOMY*.) In order to explain this inequality, or the equation of the centre, Ptolemy makes use of the hypothesis of an epicycle, which he prefers to that of the eccentric. The fifth book commences with the description of the astrolabe of Hipparchus, which Ptolemy made use of in following up the observations of that astronomer, and by means of which he made his most important discovery, that of the second inequality in the moon's motion, now known by the name of the “*evection*.” In order to explain this inequality he supposed the moon to move on an epicycle, which was carried by an eccentric whose centre turned about the earth in a direction contrary to that of the motion of the epicycle. This is the first instance in which we find the two hypotheses of eccentric and epicycle combined. The fifth book treats also of the parallaxes of the sun and moon, and gives a description of an instrument—called later by Theon the “*parallactic rods*”—devised by Ptolemy for observing meridian altitudes with greater accuracy.

The subject of parallaxes is continued in the sixth book of the *Almagest*, and the method of calculating eclipses is there given. The author says nothing in it which was not known before his time.

Books vii., viii. treat of the fixed stars. Ptolemy verified the fixity of their relative positions and confirmed the observations of Hipparchus with regard to their motion in longitude, or the precession of the equinoxes. (See *ASTRONOMY*.) The seventh book concludes with the catalogue of the stars of the northern hemisphere, in which are entered their longitudes, latitudes, and magni-

tudes, arranged according to their constellations; and the eighth book commences with a similar catalogue of the stars in the constellations of the southern hemisphere. This catalogue has been the subject of keen controversy amongst modern astronomers. Some, as Flamsteed and Lalande, maintain that it was the same catalogue which Hipparchus had drawn up 265 years before Ptolemy, whereas others, of whom Laplace is one, think that it is the work of Ptolemy himself. The probability is that in the main the catalogue is really that of Hipparchus altered to suit Ptolemy's own time, but that in making the changes which were necessary a wrong precession was assumed. This is Delambre's opinion; he says, “Whoever may have been the true author, the catalogue is unique, and does not suit the age when Ptolemy lived; by subtracting 2° 40' from all the longitudes it would suit the age of Hipparchus; this is all that is certain.”⁶ It has been remarked that Ptolemy, living at Alexandria, at which city the altitude of the pole is 5° less than at Rhodes, where Hipparchus observed, could have seen stars which are not visible at Rhodes; none of these stars, however, are in Ptolemy's catalogue. The eighth book contains, moreover, a description of the milky way and the manner of constructing a celestial globe; it also treats of the configuration of the stars, first with regard to the sun, moon, and planets, and then with regard to the horizon, and likewise of the different aspects of the stars and of their rising, culmination, and setting simultaneously with the sun.

The remainder of the work is devoted to the planets. The ninth book commences with what concerns them all in general. The planets are much nearer to the earth than the fixed stars and more distant than the moon. Saturn is the most distant of all, then Jupiter and then Mars. These three planets are at a greater distance from the earth than the sun.⁷ So far all astronomers are agreed. This is not the case, he says, with respect to the two remaining planets, Mercury and Venus, which the old astronomers placed between the sun and earth, whereas more recent writers⁸ have placed them beyond the sun, because they were never seen on the sun.⁹ He shows that this reasoning is not sound, for they might be nearer to us than the sun and not in the same plane, and consequently never seen on the sun. He decides in favour of the former opinion, which was indeed that of most mathematicians. The ground of the arrangement of the planets in order of distance was the relative length of their periodic times; the greater the circle, the greater, it was thought, would be the time required for its description. Hence we see the origin of the difficulty and the difference of opinion as to the arrangement of the sun, Mercury, and Venus, since the times in which, as seen from the earth, they appear to complete the circuit of the zodiac are nearly the same—a year.¹⁰ Delambre thinks it strange that Ptolemy did not see that these contrary opinions could be reconciled by supposing that the two planets moved in epicycles about the sun; this would be stranger still, he adds, if it is true that this idea, which is older than Ptolemy, since it is referred to by Cicero,¹¹ had been that of the Egyptians.¹² It may be added, as strangest of all, that this doctrine was held by Theon of Smyrna,¹³ who was a contemporary of Ptolemy or somewhat senior to him. From this system to that of Tycho Brahe there is, as Delambre observes, only a single step.

We have seen that the problem which presented itself to the astronomers of the Alexandrian epoch was the following: it was required to find such a system of equable circular motions as would represent the inequalities in the apparent motions of the sun, the moon, and the planets. Ptolemy now takes up this question for the planets; he says that “this perfection is of the essence of celestial things, which admit of neither disorder nor inequality,” that this planetary theory is one of extreme difficulty, and that no one had yet completely succeeded in it. He adds that it was owing to these difficulties that Hipparchus—who loved truth above all things, and who, moreover, had not received from his predecessors observations either so numerous or so precise as those that he has left—had succeeded, as far as possible, in representing the motions of the sun and moon by circles, but had not even commenced the theory of the five planets. He was content, Ptolemy

⁶ Delambre, *Histoire de l'Astronomie Ancienne*, ii. 284.

⁷ This is true of their mean distances; but we know that Mars at opposition is nearer to us than the sun.

⁸ Eratosthenes, for example, as we learn from Theon of Smyrna.

⁹ Transits of Mercury and Venus over the sun's disk, therefore, had not been observed.

¹⁰ This was known to Eudoxus. Sir George Cornewall Lewis (*An Historical Survey of the Astronomy of the Ancients*, p. 156), confusing the geocentric revolutions assigned by Eudoxus to these two planets with the heliocentric revolutions in the Copernican system, which are of course quite different, says that “the error with respect to Mercury and Venus is considerable”; this, however, is an error not of Eudoxus but of Cornewall Lewis, as Schiaparelli has remarked.

¹¹ “Hunc [solum] ut comites consequuntur Veneris alter, alter Mercurii cursum” (*Somnium Scipionis*, *De Rep.*, vi. 17). This hypothesis is alluded to by P. l'iny. N. H., ii. 17, and is more explicitly stated by Vitruvius, *Arch.*, ix. 4.

¹² Macrobius, *Commentarius ex Cicerone in Somnium Scipionis*, l. 19.

¹³ Theon (Smyræus Platonicus), *Liber de Astronomia*, ed. Th. H. Martin (Paris, 1849), pp. 174, 294, 296. Martin thinks that Theon, the mathematician, four of whose observations are used by Ptolemy (*Alm.*, ii. 176, 198, 194, 195, 196 ed. Halma), is not the same as Theon of Smyrna, on the ground chiefly that the latter was not an observer.

¹ *Système de Philosophie Positive*, iv. 173.

² This Sosigenes, as Th. H. Martin has shown, was not the astronomer of that name who was a contemporary of Julius Cæsar, but a Peripatetic philosopher who lived at the end of the 2d century A.D.

⁴ Εὐδοξῶν ἐπὶ τὰ φαινόμενα, c. i. in Halma's edition of the works of Ptolemy, vol. iii. “Introduction aux Phénomènes Célestes, traduite du Grec de Géménius,” p. 9, Paris, 1819.

⁵ This has been noticed by Pliny, who says, “Multiformi hæc (luna) ambage torset ingenia contemplantium, et proximum ignorari maxime sidus indignatum.” (*N. H.*, ii. 9).

continues, to arrange the observations which had been made on them in a methodic order and to show thence that the phenomena did not agree with the hypotheses of mathematicians at that time. He showed that in fact each planet had two inequalities, which are different for each, that the retrogradations are also different, whilst other astronomers admitted only a single inequality and the same retrogradation; he showed further that their motions cannot be explained by eccentrics nor by epicycles carried along concentrics, but that it was necessary to combine both hypotheses. After these preliminary notions he gives from Hipparchus the periodic motions of the five planets, together with the shortest times of restitutions, in which, moreover, he has made some slight corrections. He then gives tables of the mean motions in longitude and of anomaly of each of the five planets,¹ and shows how the motions in longitude of the planets can be represented in a general manner by means of the hypothesis of the eccentric combined with that of the epicycle. He next applies his theory to each planet and concludes the ninth book by the explanation of the various phenomena of the planet Mercury. In the tenth and eleventh books he treats, in like manner, of the various phenomena of the planets Venus, Mars, Jupiter, and Saturn.

Book xii. treats of the stationary and retrograde appearances of each of the planets and of the greatest elongations of Mercury and Venus. The author tells us that some mathematicians, and amongst them Apollonius of Perga, employed the hypothesis of the epicycle to explain the stations and retrogradations of the planets. Ptolemy goes into this theory, but does not change in the least the theorems of Apollonius; he only promises simpler and clearer demonstrations of them. Delambre remarks that those of Apollonius must have been very obscure, since, in order to make the demonstrations in the *Almagest* intelligible, he (Delambre) was obliged to recast them. This statement of Ptolemy is important, as it shows that the mathematical theory of the planetary motions was in a tolerably forward state long before his time. Finally, book xiii. treats of the motions of the planets in latitude, also of the inclinations of their orbits and of the magnitude of these inclinations.

Those who wish to go into details and learn the mathematical explanation of this celebrated system of "eccentrics" and "epicycles" are referred to the *Almagest* itself, which can be most conveniently studied in Halma's edition,² to Delambre's *Histoire de l'Astronomie Ancienne*, the second volume of which is for the most part devoted to the *Almagest*,³ or to Narrien's *History of Astronomy*,⁴ in which the subject is treated with great clearness.

Ptolemy concludes his great work by saying that he has included in it everything of practical utility which in his judgment should find a place in a treatise on astronomy at the time it was written, with relation as well to discoveries as to methods. His work was justly called by him *Μαθηματικὴ Σύνταξις*, for it was in fact the mathematical form of the work which caused it to be preferred to all others which treated of the same science, but not by "the sure methods of geometry and calculation." Accordingly, it soon spread from Alexandria to all places where astronomy was cultivated; numerous copies were made of it, and it became the object of serious study on the part of both teachers and pupils. Amongst its numerous commentators may be mentioned Pappus and Theon of Alexandria in the 4th century and Proclus in the 5th. It was translated into Latin by Boetius, but this translation has not come down to us. The *Syntaxis* was translated into Arabic at Baghdad by order of the enlightened caliph Al-Mansur, who was himself an astronomer, about 827 A.D., and the Arabic translation was revised in the following century by Thābit ibn Korra. The emperor Frederick II. caused the *Almagest* to be translated from the Arabic into Latin at Naples about 1230. In the 15th century it was translated from a Greek manuscript in the Vatican by George of Trebizond. In the same century an epitome of the *Almagest* was commenced by Purbach (died 1461) and completed by his pupil and successor in the professorship of astronomy in the university of Vienna, Regiomontanus. The earliest edition of this epitome is that of Venice, 1496, and this was the first appearance of the *Almagest* in print. The first complete edition of the *Almagest* is that of P. Liechtenstein (Venice, 1515),—a Latin version from the Arabic. The Latin translation of George of Trebizond was first printed in 1528, at Venice. The Greek text, which was not known in Europe until the 15th century, was first published in the 16th by Simon Grynaeus, who was also the first editor of the Greek text of Euclid, at Basel, 1538. This edition was from a manuscript in the library of Nuremberg—where it is no longer to be found—which had been presented by Regiomontanus, to whom it was given by Cardinal Bessarion. The last edition of the *Almagest* is that of Halma, Greek with French translation, in two vols., Paris, 1813-16. On the manuscripts of the *Almagest* and its bibliographical history, see Fabricius, *Bibliotheca Graeca*, ed. Harles, vol. v. p. 280, and Halma's preface. An excellent summary of the bibliographical history is given by De Morgan in his article on Ptolemy already quoted.

Other works of Ptolemy, which we now proceed to notice very briefly, are as follows. (1) *Φάσεις ἀπλανῶν ἀστέρων καὶ συναγωγὴ ἐπιστημασιῶν*, *On the Apparitions of the Fixed Stars and a Collection of Prognostics*. It is a calendar of a kind common amongst the Greeks under the name of *παράρημα*, or a collection of the risings and settings of the stars in the morning or evening twilight, which were so many visible signs of the seasons, with prognostics of the principal changes of temperature with relation to each climate, after the observations of the best meteorologists, as, for example, Meton, Democritus, Eudoxus, Hipparchus, &c. Ptolemy, in order to make his *Παραρημα* useful to all the Greeks scattered over the enlightened world of his time, gives the apparitions of the stars not for one parallel only but for each of the five parallels

in which the length of the longest day varies from 13½ hours to 15½ hours,—that is, from the latitude of Syene to that of the middle of the Euxine. This work has been printed by Petavius in his *Uranologium*, Paris, 1630, and by Halma in his edition of the works of Ptolemy, vol. iii., Paris, 1810. (2) *Προβόσεις τῶν πλανημένων ἢ τῶν οὐρανίων κύκλων κινήσεις*, *On the Planetary Hypothesis*. This is a summary of a portion of the *Almagest*, and contains a brief statement of the principal hypotheses for the explanation of the motions of the heavenly bodies. It was first published (Gr., Lat.) by Bainbridge, the Savilian professor of astronomy at Oxford, with the *Sphaera* of Proclus and the *Κανὼν βασιλειῶν*, London, 1620, and afterwards by Halma, vol. iv., Paris, 1820. (3) *Κανὼν βασιλειῶν*, *A Table of Reigns*. This is a chronological table of Assyrian, Persian, Greek, and Roman sovereigns, with the length of their reigns, from Nabonassar to Antoninus Pius. This table (comp. G. Syncellus, *Chronogr.*, ed. Dind., i. 388 sq.) has been printed by Scaliger, Calvisius, Petavius, Bainbridge (as above noted), and by Halma, vol. iii., Paris, 1810. (4) *Ἀρμονικὴ βιβλία γ'*. This *Treatise on Music* was published in Greek and Latin by Wallis at Oxford, 1682. It was afterwards reprinted with Porphyry's commentary in the third volume of Wallis's works, Oxford, 1699. (5) *Τετραβιβλος σύνταξις*, *Tetrabiblon or Quadripartitum*. This work is astrological, as is also the small collection of aphorisms, called *Καρπὸς ἢ Centiloquium*, by which it is followed. It is doubtful whether these works are genuine, but the doubt merely arises from the feeling that they are unworthy of Ptolemy. They were both published in Greek and Latin by Camerarius, Nuremberg, 1558, and by Melanchthon, Basel, 1558. (6) *De Analemmate*. The original of this work of Ptolemy is lost. It was translated from the Arabic and published by Commandine, Rome, 1492. The *Analemma* is the description of the sphere on a plane. We find in it the sections of the different circles, as the diurnal parallels, and everything which can facilitate the intelligence of gnomonics. This description is made by perpendiculars let fall on the plane; whence it has been called by the moderns "orthographic projection." (7) *Πλάνισφαιρον*, *The Planisphere*. The Greek text of this work also is lost, and we have only a Latin translation of it from the Arabic. The "planisphere" is a projection of the sphere on the equator, the eye being at the pole,—in fact what is now called "stereographic" projection. The best edition of this work is that of Commandine, Venice, 1558. (8) *Optics*. This work is known to us only by imperfect manuscripts in Paris and Oxford, which are Latin translations from the Arabic; some extracts from them have been recently published. The *Optics* consists of five books, of which the fifth presents most interest: it treats of the refraction of luminous rays in their passage through media of different densities, and also of astronomical refractions, on which subject the theory is more complete than that of any astronomer before the time of Cassini. De Morgan doubts whether this work is genuine on account of the absence of allusion to the *Almagest* or to the subject of refraction in the *Almagest* itself; but his chief reason for doubting its authenticity is that the author of the *Optics* was a poor geometer. (G. J. A.)

Geography.

Ptolemy is hardly less celebrated as a geographer than as an astronomer, and his great work on geography exercised as great an influence on the progress of that science as did his *Almagest* on that of astronomy. It became indeed the paramount authority on all geographical questions for a period of many centuries, and was only gradually superseded by the progress of maritime discovery in the 15th and 16th centuries. This exceptional position was due in a great measure to its scientific form, which rendered it very convenient and easy of reference; but, apart from this consideration, it was really the first attempt ever made to place the study of geography on a truly scientific basis. The great astronomer Hipparchus had indeed pointed out, three centuries before the time of Ptolemy, that the only way to construct a really trustworthy map of the Inhabited World would be by observations of the latitude and longitude of all the principal points on its surface, and laying down a map in accordance with the positions thus determined. But the materials for such a course of proceeding were almost wholly wanting, and, though Hipparchus made some approach to a correct division of the known world into zones of latitude, or "climata," as he termed them, trustworthy observations even of this character were in his time very few in number, while the means of determining longitudes could hardly be said to exist. Hence probably it arose that no attempt was made by succeeding geographers to follow up the important suggestion of Hipparchus. Marinus of Tyre, who lived shortly before the time of Ptolemy, and whose work is known to us only through that writer, appears to have been the first to resume the problem thus proposed, and lay down the map of the known world in accordance with the precepts of Hipparchus. His materials for the execution of such a design were indeed miserably inadequate, and he was forced to content himself for the most part with determinations derived not from astronomical observations but from the calculation of distances from itineraries and other rough methods, such as still continue to be employed even by modern geographers where more accurate

¹ Delambre compares these mean motions with those of our modern tables and finds them tolerably correct. By "motion in longitude" must be understood the motion of the centre of the epicycle about the eccentric, and by "anomaly" the motion of the star on its epicycle.

² In this edition the Greek text and the French translation are given in parallel columns; the latter, however, should not be read without reference to the former.

³ Delambre begins his analysis of the *Almagest* thus—"L'Astronomie des Grecs est toute entière dans la Syntaxe mathématique de Ptolémée."

⁴ Narrien, *An Historical Account of the Origin and Progress of Astronomy*, London, 1833.

means of determination are not available. The greater part of the treatise of Marinus was occupied with the discussion of these authorities, and it is impossible for us, in the absence of the original work, to determine how far he had succeeded in giving a scientific form to the results of his labours; but we are told by Ptolemy himself that he considered them, on the whole, so satisfactory that he had made the work of his predecessor the basis of his own in regard to all the countries bordering on the Mediterranean, a term which would comprise to the ancient geographer almost all those regions of which he had really any definite knowledge. With respect to the more remote regions of the world, Ptolemy availed himself of the information imparted by Marinus, but not without reserve, and has himself explained to us the reasons that induced him in some instances to depart from the conclusions of his predecessor. It is very unjust to term Ptolemy a plagiarist from Marinus, as has been done by some modern authors, as he himself acknowledges in the fullest manner his obligations to that writer, from whom he derived the whole mass of his materials, which he undertook to arrange and present to his readers in a scientific form. It is this form and arrangement that constitute the great merit of Ptolemy's work and that have stamped it with a character wholly distinct from all previous treatises on geography. But at the same time it possesses much interest, as showing the greatly increased knowledge of the more remote portions of Asia and Africa which had been acquired by geographers since the time of Strabo and Pliny.

It will be convenient to consider separately the two different branches of the subject,—(1) the mathematical portion, which constitutes his geographical system, properly so termed; and (2) his contributions to the progress of positive knowledge with respect to the Inhabited World.

See Plate
VII., vol.
xv.

1. *Mathematical Geography*.—As a great astronomer, Ptolemy was of course infinitely better qualified to comprehend and explain the mathematical conditions of the earth and its relations to the celestial bodies that surround it than any preceding writers on the special subject of geography. But his general views, except on a few points, did not differ from those of his most eminent precursors Eratosthenes and Strabo. In common with them, he assumed that the earth was a globe, the surface of which was divided by certain great circles—the equator and the tropics—parallel to one another, and dividing the earth into five great zones, the relations of which with astronomical phenomena were of course clear to his mind as a matter of theory, though in regard to the regions bordering on the equator, as well as to those adjoining the polar circle, he could have had no confirmation of his conclusions from actual observation. He adopted also from Hipparchus the division of the equator and other great circles into 360 parts or “degrees” (as they were subsequently called, though the word does not occur in this sense in Ptolemy), and supposed other circles to be drawn through these, from the equator to the pole, to which he gave the name of “meridians.” He thus conceived the whole surface of the earth (as is done by modern geographers) to be covered with a complete network of “parallels of latitude” and “meridians of longitude,” terms which he himself was the first extant writer to employ in this technical sense. Within the network thus constructed it was the task of the scientific geographer to place the outline of the world, so far as it was then known by experience and observation.

Unfortunately at the very outset of his attempt to realize this conception he fell into an error which had the effect of vitiating all his subsequent conclusions. Eratosthenes was the first writer who had attempted in a scientific manner to determine the circumference of the earth, and the result at which he arrived, that it amounted to 250,000 stadia or 25,000 geographical miles, was generally adopted by subsequent geographers, including Strabo. Posidonius, however, who wrote about a century after Eratosthenes, had made an independent calculation, by which he reduced the circumference of the globe to 180,000 stadia, or less than three-fourths of the result obtained by Eratosthenes, and this computation, on what grounds we know not, was unfortunately adopted by Marinus Tyrius, and from him by Ptolemy. The consequence of this error was of course to make every degree of latitude or longitude (measured at the equator) equal to only 500 stadia (50 geographical miles), instead of its true equivalent of 600 stadia. Its effects would indeed have been in some measure neutralized had there existed a sufficient number of points of which the position

was determined by actual observation; but we learn from Ptolemy himself that this was not the case, and that such observations for latitude were very few in number, while the means of determining longitudes were almost wholly wanting.¹ Hence the positions laid down by him were really, with very few exceptions, the result of computations of distances from itineraries and the statements of travellers, estimates which were liable to much greater error in ancient times than at the present day, from the want of any accurate mode of observing bearings, or portable instruments for the measurement of time, while they had no means at all of determining distances at sea, except by the rough estimate of the time employed in sailing from point to point. The use of the log, simple as it appears to us, was unknown to the ancients. But, great as would naturally be the errors resulting from such imperfect means of calculation, they were in most cases increased by the permanent error arising from the erroneous system of graduation adopted by Ptolemy in laying them down upon his map. Thus, if he had arrived at the conclusion from itineraries that two places were 5000 stadia from one another, he would place them at a distance of 10° apart, and thus in fact separate them by an interval of 6000 stadia.

Another source of permanent error (though one of much less importance) which affected all his longitudes arose from the erroneous assumption of his prime meridian. In this respect also he followed Marinus, who, having arrived at the conclusion that the Fortunate Islands (the Canaries) were situated farther west than any part of the continent of Europe, had taken the meridian through the outermost of this group as his prime meridian, from whence he calculated all his longitudes eastwards to the Indian Ocean. But, as both Marinus and Ptolemy were very imperfectly acquainted with the position and arrangements of the islands in question, the line thus assumed was in reality a purely imaginary one, being drawn through the supposed position of the outer island, which they placed 2½° west of the Sacred Promontory (Cape St Vincent), which was regarded by Marinus and Ptolemy, as it had been by all previous geographers, as the westernmost point of the continent of Europe,—while the real difference between the two is not less than 9° 20'. Hence all Ptolemy's longitudes, reckoned eastwards from this assumed line, were in fact about 7° less than they would have been if really measured from the meridian of Ferro, which continued so long in use among geographers in modern times. The error in this instance was the more unfortunate as the longitude could not of course be really measured, or even calculated, from this imaginary line, but was in reality calculated in both directions from Alexandria, westwards as well as eastwards (as Ptolemy himself has done in his eighth book) and afterwards reversed, so as to suit the supposed method of computation.

It must be observed also that the equator was in like manner placed by Ptolemy at a considerable distance from its true geographical position. The place of the equinoctial line on the surface of the globe was of course well known to him as a matter of theory, but as no observations could have been made in these remote regions he could only calculate its place from that of the tropic, which he supposed to pass through Syene. And as he had, as elsewhere, reckoned a degree of latitude as equivalent to 500 stadia, he inevitably made the interval between the tropic and the equator too small by one-sixth; and the place of the former on the surface of the earth being fixed by observation he necessarily carried up the supposed place of the equator too high by more than 250 geographical miles. But as he had practically no geographical acquaintance with the equinoctial regions of the earth this error was of little importance.

With Marinus and Ptolemy, as with all preceding Greek geographers, the most important line on the surface of the globe for all practical purposes was the parallel of 36° of latitude, which passes through the Straits of Gibraltar at one end of the Mediterranean, and through the Island of Rhodes and the Gulf of Issus at the other. It was thus regarded by Dicaearchus and almost all his successors as dividing the regions around the inland sea into two portions, and as being continued in theory along the chain of Mount Taurus till it joined the great mountain range north of India; and from thence to the Eastern Ocean it was regarded as constituting the dividing line of the Inhabited World, along which its length must be measured. But it sufficiently shows how inaccurate were the observations and how imperfect the materials at his command, even in regard to the best known portions of the earth, that Ptolemy, following Marinus, describes this parallel as passing through Caralis in Sardinia and Lilybaeum in Sicily, the one being really in 39° 12' lat., the other in 37° 50'. It is still more strange that he places so important and well known a city as Carthage 1° 29' south of the dividing parallel, while it really lies nearly 1° to the north of it.

¹ Hipparchus had indeed pointed out long before the mode of determining longitudes by observations of eclipses, but the instance to which he referred of the celebrated eclipse before the battle of Arbela, which was seen also at Carthage, was a mere matter of popular observation, of no scientific value. Yet Ptolemy seems to have known of no other.

The great problem that had attracted the attention and exercised the ingenuity of all geographers from the time of Dicæarchus to that of Ptolemy was to determine the length and breadth of the Inhabited World, which they justly regarded as the chief subject of the geographer's consideration. This question had been very fully discussed by Marinus, who had arrived at conclusions widely different from those of his predecessors. Towards the north indeed there was no great difference of opinion, the latitude of Thule being generally recognized as that of the highest northern land, and this was placed both by Marinus and Ptolemy in 63° lat., not very far beyond the true position of the Shetland Islands, which had come in their time to be generally identified with the mysterious Thule of Pytheas. The western extremity, as already mentioned, had been in like manner determined by the prime meridian drawn through the supposed position of the Fortunate Islands. But towards the south and east Marinus gave an enormous extension to the continents of Africa and Asia, beyond what had been known to or suspected by the earlier geographers, and, though Ptolemy greatly reduced his calculations, he still retained a very exaggerated estimate of their results.

The additions thus made to the estimated dimensions of the known world were indeed in both directions based upon a real extension of knowledge, derived from recent information; but unfortunately the original statements were so perverted by misinterpretation in applying them to the construction of a map as to give results differing widely from the truth. The southern limit of the world as known to Eratosthenes, and even to Strabo (who had in this respect no further knowledge than his predecessor more than two centuries before), had been fixed by them at the parallel which passed through the eastern extremity of Africa (Cape Guardafui), or the Land of Cinnamon as they termed it, and that of the Sembritzæ (corresponding to Seunaa) in the interior of the same continent. This parallel, which would correspond nearly to that of 10° of true latitude, they supposed to be situated at a distance of 3400 stadia (340 geographical miles) from that of Meroë (the position of which was accurately known), and 13,400 to the south of Alexandria; while they conceived it as passing, when prolonged to the eastward, through the island of Taprobane (Ceylon), which was universally recognized as the southernmost land of Asia. Both these geographers were wholly ignorant of the vast extension of Africa to the south of this line and even of the equator, and conceived it as trending away to the west from the Land of Cinnamon and then to the north-west to the Straits of Gibraltar. Marinus had, however, learned from itineraries both by land and sea the fact of this great extension, of which he had indeed conceived so exaggerated an idea that even after Ptolemy had reduced it by more than a half it was still materially in excess of the truth. The eastern coast of Africa was indeed tolerably well known, being frequented by Greek and Roman traders, as far as a place called Rhapta, opposite to Zanzibar, and this is placed by Ptolemy not far from its true position in 7° S. lat. But he added to this a bay of great extent as far as a promontory called Prasum (perhaps Cape Delgado), which he placed in $15\frac{1}{2}^{\circ}$ S. lat. At the same time he assumed the position in about the same parallel of a region called Agisymba, which was supposed to have been discovered by a Roman general, whose itinerary was employed by Marinus. Taking, therefore, this parallel as the limit of knowledge to the south, while he retained that of Thule to the north, he assigned to the inhabited world a breadth of nearly 80° , instead of less than 60° , which it had occupied on the maps of Eratosthenes and Strabo.

It had been a fixed belief with all the Greek geographers from the earliest attempts at scientific geography not only that the length of the Inhabited World greatly exceeded its breadth, but that it was more than twice as great,—a wholly unfounded assumption, but to which their successors seem to have felt themselves bound to conform. Thus Marinus, while giving an undue extension to Africa towards the south, fell into a similar error, but to a far greater degree, in regard to the extension of Asia towards the east. Here also he really possessed a great advance in knowledge over all his predecessors, the increased trade with China for silk having led to an acquaintance, though of course of a very vague and general kind, with the vast regions in Central Asia that lay to the east of the Pamir range, which had formed the limit of the Asiatic nations previously known to the Greeks. But Marinus had learned that traders proceeding eastward from the Stone Tower—a station at the foot of this range—to Sera, the capital city of the Seres, occupied seven months on the journey, and from thence he arrived at the enormous result that the distance between the two points was not less than 36,200 stadia, or 3620 geographical miles. Ptolemy, while he justly points out the absurdity of this conclusion and the erroneous mode of computation on which it was founded, had no means of correcting it by any real authority, and hence reduced it summarily by one half. The effect of this was to place Sera, the easternmost point on his map of Asia, at a distance of $45\frac{1}{2}^{\circ}$ from the Stone Tower, which again he fixed, on the authority of itineraries cited by Marinus, at 24,000 stadia or 60° of longitude from the Euphrates, reckoning in both cases a degree of longitude as equivalent to 400

stadia, in accordance with his uniform system of allowing 500 stadia to 1° of latitude. Both distances were greatly in excess of the truth, independently of the error arising from this mistaken system of graduation. The distances west of the Euphrates were of course comparatively well known, nor did Ptolemy's calculation of the length of the Mediterranean differ very materially from those of previous Greek geographers, though still greatly exceeding the truth, after allowing for the permanent error of graduation. The effect of this last cause, it must be remembered, would unfortunately be cumulative, in consequence of the longitudes being computed from a fixed point in the west, instead of being reckoned east and west from Alexandria, which was undoubtedly the mode in which they were really calculated. The result of these combined causes of error was to lead him to assign no less than 180° , or 12 hours, of longitude to the interval between the meridian of the Fortunate Islands and that of Sera, which really amounts to about 130° .

But in thus estimating the length and breadth of the known world Ptolemy attached a very different sense to these terms from that which they had generally borne with preceding writers. All former Greek geographers, with the single exception of Hipparchus, had agreed in supposing the Inhabited World to be surrounded on all sides by sea, and to form in fact a vast island in the midst of a circumfluous ocean. This notion, which was probably derived originally from the Homeric fiction of an ocean stream, and was certainly not based upon direct observation, was nevertheless of course in accordance with the truth, great as was the misconception it involved of the extent and magnitude of the continents included within this assumed boundary. Hence it was unfortunate that Ptolemy should in this respect have gone back to the views of Hipparchus, and have assumed that the land extended indefinitely to the north in the case of Europe and Scythia, to the east in that of Asia, and to the south in that of Africa. His boundary-line was in each of these cases an arbitrary limit, beyond which lay the Unknown Land, as he calls it. But in the last case he was not content with giving to Africa an indefinite extension to the south: he assumed the existence of a vast prolongation of the land to the east from its southernmost known point, so as to form a connexion with the south-eastern extremity of Asia, of the extent and position of which he had a wholly erroneous idea.

In this last case Marinus had derived from the voyages of recent navigators in the Indian Seas a knowledge of the fact that there lay in that direction extensive lands which had been totally unknown to previous geographers, and Ptolemy had acquired still more extensive information in this quarter. But unfortunately he had formed a totally false conception of the bearings of the coasts thus made known, and consequently of the position of the lands to which they belonged, and, instead of carrying the line of coast northwards from the Golden Chersonese (the Malay Peninsula) to China or the land of the Sinae, he brought it down again towards the south after forming a great bay, so that he placed Cattigara—the principal emporium in this part of Asia, and the farthest point known to him—on a supposed line of coast, of unknown extent, but with a direction from north to south. The hypothesis that this land was continuous with the most southern part of Africa, so that the two enclosed one vast gulf, though a mere assumption, is stated by him as definitely as if it was based upon positive information; and it was long received by mediæval geographers as an unquestioned fact. This circumstance undoubtedly contributed to perpetuate the error of supposing that Africa could not be circumnavigated, in opposition to the more correct views of Strabo and other earlier geographers. On the other hand, there can be no doubt that the undue extension of Asia towards the east, so as to diminish by 50° of longitude the interval between that continent and the western coasts of Europe, had a material influence in fostering the belief of Columbus and others that it was possible to reach the Land of Spices (as the East Indian islands were then called) by direct navigation towards the west.

It is not surprising that Ptolemy should have fallen into considerable errors respecting the more distant quarters of the world; but even in regard to the Mediterranean and its dependencies, as well as the regions that surrounded them, with which he was in a certain sense well acquainted, the imperfection of his geographical knowledge is strikingly apparent. Here he had indeed some well-established data for his guidance, as far as latitudes were concerned. That of Massilia had been determined many years before by Pytheas within a few miles of its true position, and the latitude of Rome, as might be expected, was known with approximate accuracy. Those of Alexandria and Rhodes also were well known, having been the place of observation of distinguished astronomers, and the fortunate accident that the Island of Rhodes lay on the same parallel of latitude with the Straits of Gibraltar at the other end of the sea enabled him to connect the two by drawing the parallel direct from the one to the other. The importance attached to this line (36° N. lat.) by all preceding geographers has been already mentioned. Unfortunately Ptolemy, like his predecessors, supposed its course to lie almost uniformly through the open sea, wholly ignoring the great projection of the African coast towards

the north from Carthage to the neighbourhood of the straits. The erroneous position assigned to the former city has been already adverted to, and, being supposed to rest upon astronomical observation, doubtless determined that of all the north coast of Africa. The result was that he assigned to the width of the Mediterranean from Massilia to the opposite point of the African coast an extent of more than 11° of latitude, while it does not really exceed $6\frac{1}{2}^{\circ}$.

At the same time he was still more at a loss in respect of longitudes, for which he had absolutely no trustworthy observations to guide him; but he nevertheless managed to arrive at a result considerably nearer the truth than had been attained by previous geographers, all of whom had greatly exaggerated the length of the Inland Sea. Their calculations, like those of Marinus and Ptolemy, could only be founded on the imperfect estimates of mariners; but unfortunately Ptolemy, in translating the conclusions thus arrived at into a scientific form, vitiated all his results by his erroneous system of graduation, and, while the calculation of Marinus gave a distance of 24,800 stadia as the length of the Mediterranean from the straits to the Gulf of Issus, this was converted by Ptolemy in preparing his tables to an interval of 62° , or just about 20° beyond the truth. Even after correcting the error due to his erroneous computation of 500 stadia to a degree, there remains an excess of nearly 500 geographical miles, which was doubtless owing to the exaggerated estimates of distances almost always made by navigators who had no real means of measuring them.

Another unfortunate error which disfigured the eastern portion of his map of the Mediterranean was the position assigned to Byzantium, which Ptolemy (misled in this instance by the authority of Hipparchus) placed in the same latitude with Massilia ($43^{\circ} 5'$), thus carrying it up more than 2° above its true position. This had the inevitable effect of transferring the whole of the Euxine Sea—with the general form and dimensions of which he was fairly well acquainted—too far to the north by the same amount; but in addition to this he enormously exaggerated the extent of the Palus Mæotis (the Sea of Azoff), which he at the same time represented as having its direction from south to north, so that by the combined effect of these two errors he carried up its northern extremity (with the mouth of the Tanais and the city of that name) as high as $54^{\circ} 30'$, or on the true parallel of the south shore of the Baltic. Yet, while he fell into this strange misconception with regard to the great river which was universally considered by the ancients as the boundary between Europe and Asia, he was the first writer of antiquity who showed a clear conception of the true relations between the Tanais and the Rha or Volga, which he correctly described as flowing into the Caspian Sea. With respect to this last also he was the first geographer after the time of Alexander to return to the correct view (already found in Herodotus) that it was an inland sea, without any communication with the Northern Ocean.

With regard to the north of Europe his views were still very vague and imperfect. He had indeed considerably more acquaintance with the British Islands than any previous geographer, and even showed a tolerably accurate knowledge of some portions of their shores. But his map was, in this instance, disfigured by two unfortunate errors,—the one, that he placed Ireland (which he calls Ivernica) altogether too far to the north, so that its southernmost portion was brought actually to a latitude beyond that of North Wales; the other, which was probably connected with it, that the whole of Scotland is *twisted round*, so as to bring its general extension into a direction from west to east, instead of from south to north, and place the northern extremity of the island on the same parallel with the promontory of Galloway. He appears to have been embarrassed in this part of his map by his having adopted the conclusion of Marinus—based upon what arguments we know not—that Thule was situated in 63° , while at the same time he regarded it, in conformity with the received view of all earlier geographers, as the most northern of all known lands. In accordance with this same assumption Ptolemy supposed the northern coast of Germany, which he believed to be the southern shore of the Great Ocean, to have a general direction from west to east, while he placed it not very far from the true position of that of the Baltic, of the existence of which as an inland sea he was wholly ignorant, as well as of the vast peninsula of Scandinavia beyond it, and only inserted the name of Scandia as that of an island of inconsiderable dimensions. At the same time he supposed the coast of Sarmatia from the Vistula eastwards to trend away to the north as far as the parallel of Thule; nor did he conceive this as an actual limit, but believed the Unknown Land to extend indefinitely in this direction, as also to the north of Asiatic Scythia.

The enormous extent assigned by him to the latter region has been already adverted to; but vague and erroneous as were his views concerning it, it is certain that they show a much greater approximation to the truth than those of earlier geographers, who possessed hardly a suspicion of the vast tracts in question, which stretch across Central Asia from the borders of Sarmatia to those of China. Ptolemy was also the first who had anything like a clear idea of the chain to which he gave the name of Imaus, and correctly regarded as having a direction across Scythia from south

to north, so as to divide that great region into two distinct portions which he termed Scythia intra Imaum and Scythia extra Imaum, corresponding in some degree with those recognized in modern maps as Independent and Chinese Tartary. The Imaus of Ptolemy corresponds clearly to the range known in modern days as the Bolor or Pamir, which has only been fully explored in quite recent times. It was, however, enormously misplaced, being transferred to 140° E. long., or 80° east of Alexandria, the real interval between the two being little more than 40° .

It is in respect of the southern shores of Asia that Ptolemy's geography is especially faulty, and his errors are here the more unfortunate as they were associated with greatly increased knowledge in a general way of the regions in question. For more than a century before his time, indeed, the commercial relations between Alexandria, as the great emporium of the Roman empire, and India had assumed a far more important character than at any former period, and the natural consequence was a greatly increased geographical knowledge of the Indian peninsula. The little tract called the *Periplus of the Erythraean Sea*, about 80 A.D., contains sailing directions for merchants to the western ports of that country, from the mouth of the Indus to the coast of Malabar, and correctly indicates that the coast from Barygaza southwards had a general direction from north to south as far as the extremity of the peninsula (Cape Comorin). We are utterly ignorant of the reasons which induced Marinus, followed in this instance as in so many others by Ptolemy, to depart from this correct view, and, while giving to the coast of India, from the mouths of the Indus to those of the Ganges, an undue extension in longitude, to curtail its extension towards the south to such an amount as to place Cape Cory (the southernmost point of the peninsula) only 4° of latitude south of Barygaza, the real intervals being more than 800 geographical miles, or, according to Ptolemy's system of graduation, 16° of latitude! This enormous error, which has the effect of distorting the whole appearance of the south coast of Asia, is associated with another equally extraordinary, but of an opposite tendency, in regard to the neighbouring island of Taprobane or Ceylon, the dimensions of which had been exaggerated by most of the earlier Greek geographers; but to such an extent was this carried by Ptolemy as to extend it through not less than 15° of latitude and 12° of longitude, so as to make it about fourteen times as large as the reality, and bring down its southern extremity more than 2° to the south of the equator.

We have much less reason to be surprised at finding similar distortions in respect to the regions beyond the Ganges, concerning which he is our only ancient authority. During the interval which elapsed between the date of the *Periplus* and that of Marinus it is certain that some adventurous Greek mariners had not only crossed the great Gangetic Gulf and visited the land on the opposite side, to which they gave the name of the Golden Chersonese, but they had pushed their explorations considerably farther to the east, as far as Cattigara. It was not to be expected that these commercial ventures should have brought back any accurate geographical information, and accordingly we find the conception entertained by Ptolemy of these newly discovered regions to be very different from the reality. Not only had the distances, as was usually the case with ancient navigators in remote quarters, been greatly exaggerated, but the want of accurate observations of bearings was peculiarly unfortunate in a case where the real features of the coast and the adjoining islands were so intricate and exceptional. A glance at the map appended to the article MAP (vol. xv. Plate VII.) will at once show the entire discrepancy between the configuration of this part of Asia as conceived by Ptolemy and its true formation. Yet with the materials at his command we can hardly wonder at his not having arrived at a nearer approximation to the truth. The most unfortunate error was his idea that after passing the Great Gulf, which lay beyond the Golden Chersonese, the coast trended away to the south, instead of towards the north, and he thus placed Cattigara (which was probably one of the ports in the south of China) not less than $8\frac{1}{2}^{\circ}$ south of the equator. It is probable that in this instance he was misled by his own theoretical conclusions, and carried this remotest part of the Asiatic continent so far to the south with the view of connecting it with his assumed eastward prolongation of that of Africa.

Notwithstanding this last theoretical assumption Ptolemy's map of Africa presents a marked improvement upon those of Eratosthenes and Strabo. But his knowledge of the west coast, which he conceived as having its direction nearly on a meridional line from north to south, was very imperfect, and his latitudes utterly erroneous. Even in regard to the Fortunate Islands, the position of which was so important to his system in connexion with his prime meridian, he was entirely misinformed as to their character and arrangement, and extended the group through a space of more than 5° of latitude, so as to bring down the most southerly of them to the real parallel of the Cape de Verd Islands.

In regard to the mathematical construction, or, to use the modern phrase, the projection of his maps, not only was Ptolemy

greatly in advance of all his predecessors, but his theoretical skill was altogether beyond the nature of the materials to which he applied it. The methods by which he obviated the difficulty of transferring the delineation of different countries from the spherical surface of the globe to the plane surface of an ordinary map differed indeed but little from those in use at the present day, and the errors arising from this cause (apart from those produced by his fundamental error of graduation) were really of little consequence compared with the defective character of his information and the want of anything approaching to a survey of the countries delineated. He himself was well aware of his deficiencies in this respect, and, while giving full directions for the scientific construction of a general map, he contents himself for the special maps of different countries with the simple method employed by Marinus of drawing the parallels of latitude and meridians of longitude as straight lines, assuming in each case the proportion between the two, as it really stood with respect to some one parallel towards the middle of the map, and neglecting the inclination of the meridians to one another. Such a course, as he himself repeatedly affirms, will not make any material difference within the limits of each special map.

Ptolemy's geographical work was devoted almost exclusively to the mathematical branch of his subject, and its peculiar arrangement, in which his results are presented in a tabular form, instead of being at once embodied in a map, was undoubtedly designed to enable the geographical student to construct his maps for himself, instead of depending upon those constructed ready to his hand. This purpose it has abundantly served, and there is little doubt that we owe to the peculiar form thus given to his results their transmission in a comparatively perfect condition to the present day. Unfortunately the specious appearance of the results thus presented to us has led to a very erroneous estimate of their accuracy, and it has been too often supposed that what was stated in so scientific a form must necessarily be based upon scientific observations. Though Ptolemy himself has distinctly pointed out in his first book the defective nature of his materials and the true character of the data furnished by his tables, few readers studied this portion of his work, and his statements were generally received with the same undoubting faith as was justly attached to his astronomical observations. It is only in quite recent times that his conclusions have been estimated at their just value, and the apparently scientific character of his work shown to be in most cases a specious edifice resting upon no adequate foundations.

There can be no doubt that the work of Ptolemy was from the time of its first publication accompanied with maps, which are regularly referred to in the eighth book. But how far those which are now extant represent the original series is a disputed point. In two of the most ancient MSS. it is expressly stated that the maps which accompany them are the work of one Agathodæmon of Alexandria, who "drew them according to the eight books of Claudius Ptolemy." This expression might equally apply to the work of a contemporary draughtsman under the eyes of Ptolemy himself, or to that of a skilful geographer at a later period, and nothing is known from any other source concerning this Agathodæmon. The attempt to identify him with a grammarian of the same name who lived in the 5th century is wholly without foundation. But it appears, on the whole, most probable that the maps appended to the MSS. still extant have been transmitted by uninterrupted tradition from the time of Ptolemy.

2. *Progress of Geographical Knowledge.*—The above examination of the methods pursued by Ptolemy in framing his general map of the world, or according to the phrase universally employed by the ancients, the *Inhabited World* (*ἡ οἰκουμένη*), has already drawn attention to the principal extensions of geographical knowledge since the time of Strabo.

While anything like an accurate acquaintance was still confined to the limits of the Roman empire and the regions that immediately adjoined it, with the addition of the portions of Asia that had been long known to the Greeks, the geographical horizon had been greatly widened towards the east by commercial enterprise, and towards the south by the same cause, combined with expeditions of a military character, but which would appear to have been dictated by a spirit of discovery. Two expeditions of this kind had been carried out by Roman generals before the time of Marinus, which, starting from Pezzan, had penetrated the heart of the African continent due south as far as a tract called Agisymba, "which was inhabited by Ethiopians and swarmed with rhinoceroses." These statements point clearly to the expeditions having traversed the great desert and arrived at the Soudan or Negroland. But the actual position of Agisymba cannot be determined except by mere conjecture. The absurdly exaggerated view taken by Marinus has been already noticed; but, even after his estimate had been reduced by Ptolemy by more than one-half, the position assigned by that author to Agisymba was doubtless far in excess towards the south. But, while this name was the only result that we know to have been derived from these memorable expeditions, Ptolemy found himself in possession of a considerable amount of information concerning the interior of northern Africa (from whence derived we

know not), to which nothing similar is found in any earlier writer. Unfortunately this new information was of so crude and vague a character, and is presented to us in so embarrassing a form, as to perplex rather than assist the geographical student, and the statements of Ptolemy concerning the rivers Gir and Nigir, and the lakes and mountains with which they were connected, have exercised the ingenuity and baffled the sagacity of successive generations of geographers in modern times to interpret or explain them. It may safely be said that they present no resemblance to the real features of the country as known to us by modern explorations, and cannot be reconciled with them except by the most arbitrary conjectures.

It is otherwise in the case of the Nile. To discover the source of that river had been long an object of curiosity both among the Greeks and Romans, and an expedition sent out for that purpose by the emperor Nero had undoubtedly penetrated as far as the marshes of the White Nile; but we are wholly ignorant of the sources from whence Ptolemy derived his information. But his statement that the mighty river derived its waters from the confluence of two streams, which took their rise in two lakes a little to the south of the equator, was undoubtedly a nearer approach to the truth than any of the theories concocted in modern times before the discovery in our own days of the two great lakes now known as the Victoria and Albert Nyanza. He at the same time notices the other arm of the river (the Blue Nile) under the name of the Astapus, which he correctly describes as rising in another lake. In connexion with this subject he introduces a range of mountains running from east to west, which he calls the Mountains of the Moon, and which have proved a sad stumbling-block to geographers in modern times, but may now be safely affirmed to represent the real fact of the existence of snow-covered mountains (Kilimanjaro and Kenia) in these equatorial regions.

Much the same remarks apply to Ptolemy's geography of Asia as to that of Africa. In this case also he had obtained, as we have already seen, a vague knowledge of extensive regions, wholly unknown to the earlier geographers, and resting to a certain extent on authentic information, though much exaggerated and misunderstood. But, while these informants had really brought home some definite statements concerning Serica or the Land of Silk, and its capital of Sera, there lay a vast region towards the north of the line of route leading to this far eastern land (supposed by Ptolemy to be nearly coincident with the parallel of 40°) of which apparently he knew nothing, but which he vaguely assumed to extend indefinitely northwards as far as the limits of the Unknown Land. The Jaxartes, which ever since the time of Alexander had been the boundary of Greek geography in this direction, still continued in that of Ptolemy to be the northern limit of all that was really known of Central Asia. Beyond that he places a mass of names of tribes, to which he could assign no definite locality, and mountain ranges which he could only place at haphazard. The character of his information concerning the south-east of Asia has been already adverted to. But, strangely as he misplaced Cattigara and the metropolis of Sinæ connected with it, there can be no doubt that we recognize in this name (variously written Thinae and Sinæ) the now familiar name of China; and it is important to observe that he places the land of the Sinæ immediately south of that of the Seres, showing that he was aware of the connexion between the two, though the one was known only by land explorations and the other by maritime voyages.

In regard to the better known regions of the world, and especially those bordering on the Mediterranean, Ptolemy according to his own account followed for the most part the guidance of Marinus. The latter seems to have relied to a great extent on the work of Timosthenes (who flourished more than two centuries before) in respect to the coasts and maritime distances. Ptolemy, however, introduced many changes, some of which he has pointed out to us, though there are doubtless many others which we have no means of detecting. For the interior of the different countries the Roman roads and itineraries must have furnished him with a mass of valuable materials which had not been available to earlier geographers. But neither Marinus nor Ptolemy seems to have taken advantage of this last resource to the extent that we should have expected, and the tables of the Alexandrian geographer abound with mistakes—even in countries so well known as Gaul and Spain—which might easily have been obviated by a more judicious use of such Roman authorities.

Great as are undoubtedly the merits of Ptolemy's geographical work, it cannot be regarded as having any claim to be a complete or satisfactory treatise upon this vast subject. It was the work of an astronomer rather than a geographer, in the highest sense of the term. Not only did its plan exclude all description of the countries with which it dealt, their climate, natural productions, inhabitants, and peculiar features, all of which are included in the domain of the modern geographer, but even its physical geography strictly so called is treated in the most irregular and perfunctory manner. While Strabo was fully alive to the importance of the great rivers and mountain chains which (to use his own expressive

phrase) "geographize" a country, Ptolemy deals with this part of his subject in so careless a manner as to be often worse than useless. Even in the case of a country so well known as Gaul the few notices that he gives of the great rivers that play so important a part in its geography are disfigured by some astounding errors; while he does not notice any of the great tributaries of the Rhine, though mentioning an obscure streamlet, otherwise unknown, because it happened to be the boundary between two Roman provinces.

The revival of the study of Ptolemy's work after the Middle Ages and the influence it exercised upon the progress of geography have been described in the article MAP (vol. xv. p. 520). His *Geographia* was printed for the first time in a Latin translation, accompanied with maps, in 1478, and numerous other editions followed in the latter part of the 15th and earlier half of the 16th century, but the Greek text did not make its appearance till 1533, when it was published at Basel in 4to, edited by the celebrated Erasmus. All these early editions, however, swarm with textual errors, and are wholly worthless for critical purposes. The same may be said of the edition of Bertius (Gr. and Lat., Leyden, 1618, typ. Elzevir), which was long the standard library edition of the work. It contains a new set of maps drawn by Mercator, as well as a fresh series (not intended to illustrate Ptolemy) by Ortelius, the Roman Itineraries, including the Tabula Peutingeriana, and much other miscellaneous matter. The first attempt at a really critical edition was made by Wilberg and Grashof (4to, Essen, 1842), but this unfortunately was never completed. The edition of Nobbe (3 vols. 8mo, Leipzig, 1843) presents the best Greek text of the whole work as yet available and has a useful index. But by far the best edition, so far as completed, is that published in Didot's *Bibliotheca Classicorum Græcorum* (Paris, 1838), edited by Dr C. Müller, with a Latin translation and a copious commentary, geographical as well as critical. The first part, which is all that has yet appeared, contains only the first three books, without the Prolegomena, which will be anxiously expected by all students of Ptolemy. (E. H. B.)

PUBLIC HEALTH. State medicine as an organized department of administration is entirely of modern growth. By the common law of England the only remedy for any act or omission dangerous to health was an action for damages or an indictment for nuisance. (See NUISANCE.) At the same time the jurisdiction of the commissioners of sewers acted to a certain extent as a preventive means. Commissions of sewers were granted by the crown, at first in virtue of the general prerogative, afterwards under the provisions of numerous statutes, the earliest dating from 1427 (6 Hen. VI. c. 5). The powers of the commissioners included the removal of obstructions in rivers, the making of fosses and drains, &c. Their jurisdiction, where still existing, is expressly preserved in the modern Public Health Acts. The indictment for nuisance still lies for many offences which are now punishable in a summary manner under the powers of recent legislation. But for a long time it was the only, not as now a concurrent, remedy. Its obvious defect is that proceedings can only be taken after the mischief has been done. Old examples of nuisances dangerous to health and punishable at common law are the keeping of swine in a town, the dividing of a house in a town so that by reason of overcrowding it would be more dangerous in time of sickness or plague, and the carrying on of offensive trades, such as the melting of tallow. The court leet seems to have had some jurisdiction in sanitary matters, confined to the prevention of nuisances and the determination of the quality of provisions within its local limits. At a comparatively early date statutes were passed dealing with matters for which the common law had provided too cumbrous a remedy. The attention of parliament, though but to a slight extent, was directed to the health of London as early as the Statute of the City of London in 1285 (13 Edw. I. st. 5). The earliest legislative enactment affecting the public health generally appears to be 12 Ric. II. c. 13, 1388, forbidding the deposit of offensive matter in rivers and other waters, as well in the city of London as in other cities. Acts of a similar character were from time to time passed to meet particular offences, such as 4 and 5 Hen. VII. c. 3, by which no butcher was to slaughter cattle in London or other walled towns. The plague called forth the Act of 1 Jac. I. c. 31, which made it a capital offence for an infected person to go abroad after being commanded by the proper authority to keep his house. The Act for the rebuilding of London after the great fire, 19 Car. II. c. 3, contained various provisions as to the height of houses, breadth of streets, construction of sewers, and prohibition of noisome trades. In 1832 the fear of cholera

led to 2 Will. IV. c. 10, empowering the privy council to take certain preventive measures against the spread of the disease. Numerous local Acts gave the authorities of the more important towns power over the public health. To this day London is governed by separate legislation. The Towns Improvement Act, 1847, contained provisions of a sanitary kind for incorporation in local Acts. But it was not until as recently as 1848 that a general Public Health Act, embracing the whole of England (except the metropolis), was passed. The Public Health Act, 1848, created a general board of health as the supreme authority in sanitary matters. The Local Government Act, 1858, amended the Act of 1848, chiefly in the direction of greater local sanitary control. By an Act immediately preceding the Act of 1858 the general board of health was superseded partly by the home office, partly by the privy council. The Local Government Board, the present central authority, was created in 1871 by 34 and 35 Vict. c. 70. The president of the Local Government Board is usually a member of the cabinet. Numerous other Acts dealing with public health were passed from 1849 to 1874. Finally in 1875 the existing law was digested into the Public Health Act, 1875 (38 and 39 Vict. c. 55).¹

The tendency of sanitary legislation has been to place local sanitary regulations in the hands of the local authorities, subject to a general superintendence by a Government department. The Act of 1875, which registers the results of this tendency, is a consolidating not an amending Act, and did not materially alter the law. It is impossible in this place to do more than give a short notice of its comprehensive provisions. For the purposes of the Act England, except the metropolis, is divided into urban and rural sanitary districts, subject respectively to the jurisdiction of urban and rural sanitary authorities. The urban authority is either the corporation of a borough, improvement commissioners, or a local board, according to circumstances. A district becomes subject to a local board at the instance of either the Local Government Board or the owners and ratepayers of the district. The local board is elected by the owners and ratepayers. It must be elected before 15th April in every year. The members hold office for three years, one-third retiring every year. The Oxford local board is governed by regulations peculiar to itself, giving the university a large proportion of members. Rural districts are continuous with poor-law unions, exclusive of any urban district. The guardians of the poor form the rural authority. There is a port sanitary authority in seaport towns. (See QUARANTINE.) The jurisdiction of a local authority is both preventive and remedial. The matters falling under this jurisdiction include (1) sewers, with certain exceptions, among which come sewers under the authority of commissioners of sewers, (2) scavenging and cleansing streets, (3) water-supply, (4) cellar-dwellings and lodging-houses, (5) nuisances,² (6) offensive

¹ For the history of sanitary legislation in England, see the *Report of the Royal Sanitary Commission*, 1869; M. D. Chalmers, *Local Government*, ch. vii.; Stephen, *Commentaries*, vol. iii. bk. iv. pt. iii. ch. ix.; G. A. H. Fitzgerald, *The Public Health Act, 1875*, Introd.

² The list of nuisances which may be dealt with summarily under the Act is as follows:—“(1) any premises in such a state as to be a nuisance or injurious to health; (2) any pool, ditch, gutter, water-course, privy, urinal, cess-pool, drain, or ash-pit so foul or in such a state as to be a nuisance or injurious to health; (3) any animal so kept as to be a nuisance or injurious to health; (4) any accumulation or deposit which is a nuisance or injurious to health; (5) any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmates, whether or not members of the same family; (6) any factory, workshop, or bakehouse (not already under the operation of any general Act for the regulation of factories or bakehouses) not kept in a cleanly state, or not ventilated in such a manner as to render harmless as far as practicable any gases, vapours, dust, or other impurities generated in the course of the work carried on therein, that are a nuisance or injurious to health, or so overcrowded while work is carried on as to be dangerous or injurious to the health of those employed therein; (7) any fireplace or furnace which does not, as far as practicable, consume the smoke arising from the combustibles used therein, and which is used for working engines by steam, or in any mill, factory, dyehouse, brewery, bakehouse, or gaswork, or in any manufacturing or trade process whatsoever; (8) any chimney (not being the chimney of a private dwelling-house) sending forth black smoke in such quantity as to be a nuisance.” In relation to these statutory nuisances it is provided that no penalty is to be inflicted in respect of any accumulation or deposit if it is necessary for business purposes and if effectual means have been taken for preventing injury therefrom to the public health, or in respect of a nuisance from uncon-

trades, (7) unsound meat, (8) infectious diseases and hospitals, (9) prevention of epidemic diseases, (10) mortuaries and (by the Public Health Act, 1879) cemeteries, (11) highways, (12) streets, (13) buildings, (14) lighting, (15) public pleasure-grounds, (16) markets and slaughter-houses, (17) licensing of hackney carriages, horses, and boats. It is to be noticed that jurisdiction in some of these cases is confined to an urban authority. Contracts made by an urban authority, whereof the value or amount exceeds £50, must be in writing, and sealed with the common seal of the authority.

Where the contract is of the value or amount of £100 or upwards tenders for its execution must be invited. A local authority has power, subject to the approval of the Local Government Board, to make bye-laws and impose penalties for their breach. The authority must appoint a medical officer and an inspector of nuisances; if an urban authority, it must in addition appoint a surveyor, clerk, and treasurer. Officers may not contract with a local authority. An urban authority has power to levy a general district rate, a private improvement rate (an additional rate levied in return for some special advantage beyond that obtained by the inhabitants in general), and (in certain cases) a highway rate. The expenses of a rural authority are either general or special, the latter being chiefly the expenses arising from sewerage and water-supply. General expenses are defrayed out of a common fund raised out of the poor rate. Special expenses are a charge upon the contributory places benefited. A local authority may, with the sanction of the Local Government Board, raise loans for the purposes of the Act. The loans are charged upon the general district rate. Legal proceedings under the Act are generally summary. Where proceedings are by action, one month's notice of action must be given where the cause of action is anything done, or intended to be done, or omitted to be done under the provisions of the Act. The action must be brought within six months after the accruing of the cause of action. The local authority and its officers are protected from personal liability for matters done in pursuance of the Act. An appeal from a court of summary jurisdiction lies to quarter sessions. In cases where the local authority decides a question as to liability to expenses, an appeal lies to the Local Government Board. The Local Government Board has power to alter areas and unite districts, to direct inquiries in relation to any matters concerning the public health in any place, to make provisional orders, and to enforce performance of duty by a defaulting local authority.

In addition to the Public Health Act, 1875, there are various Acts incorporated with that Act under the name of the "Sanitary Acts," dealing with similar subjects. These are the Bakehouse Regulation Act (1863), the Artisans and Labourers Dwellings Act (1868), the Baths and Washhouses Acts, the Labouring Classes Lodging-House Acts (1851, 1866, 1867). Since 1875 numerous Acts amending and extending the Public Health Act have been passed, dealing with (among other matters) river-pollution, water-supply, hospitals for infectious diseases, nuisance arising from alkali-works, and lodging of fruit-pickers. There is besides a mass of legislation which in fact, if not in name, has for its object the sanitary welfare of the people. It is sufficient to mention the Vaccination Acts, the Factory Acts, the Artisans and Labourers Dwellings Acts subsequent to 1868, the Merchant Shipping Acts (insuring the carrying of medicines and antiscorbutics on board ships, the provision of sleeping space for seamen, and the inspection of seamen's lodging-houses), the Adulteration Acts, and the numerous Burial Acts. In many local Acts notification of infectious disease by the medical man in attendance to the local authority is made compulsory, but the legislature has not as yet adopted any general provision of the kind.

The scientific aspect of public health does not fall within the scope of the present article; it has been treated under the title HYGIENE. It is sufficient to say here that the effect of the attention which of late years has been given to the subject is seen in the reduction of the death-rate from 22·23 per thousand in the years 1841-51 to 21·27 for the years 1871-81.

London.—The metropolis is governed by a series of statutes, some peculiar to itself, others general Acts, repealed as to the rest of England, but specially preserved as to the metropolis by the Public Health Act, 1875. The limits of the metropolis for the

sumed smoke if it be proved to the court that the smoke has been consumed as far as practicable and that the fire has been carefully attended to

purposes of public health depend primarily upon the Metropolis Management Act, 1855 (18 and 19 Vict. c. 120, s. 250, schedules A and B). The local authorities are the metropolitan board of works, the vestries and district boards, and (in the city of London) the commissioners of sewers. Asylums and hospitals are administered by the metropolitan asylums board. The water-supply is regulated by the Metropolis Water Acts, 1852 and 1871, gas by the Metropolitan Gas Act, 1860.

Scotland.—Sanitary legislation occurs as early as the reign of Alexander III. The *Statuta Gilde*, c. 19, forbade the deposit of dung or ashes in the street, market, or on the banks of the Tweed at Berwick under a penalty of eight shillings. At a later date the Act of 1540, c. 20, enacted that no flesh was to be slain in Edinburgh on the east side of the Leith Wynd; that of 1621, c. 29, fixed the locality of fleshers and candlemakers. The existing law of public health is contained in the Public Health (Scotland) Act, 1867 (30 and 31 Vict. c. 101). The local authority is the town council, the police commissioners or trustees, or the parochial board, according to circumstances. There is no distinction of urban and rural authority. The central authority is the board of supervision constituted by 8 and 9 Vict. c. 83. Proceedings by a local authority in cases of nuisance are by summary petition to a sheriff or a justice (in some cases only to a sheriff) upon requisition in writing under the hands of ten inhabitants. An appeal lies in cases of sufficient value from the sheriff-substitute to the sheriff and from the sheriff to the Court of Session. The list of nuisances in the Act differs, but not materially, from that in the English Act. The powers of local authorities in England and Scotland are very similar. There are no provisions as to contracts by local authorities corresponding to those in the English Act.

Ireland.—Several Acts of the Irish parliament dealt with specific nuisances, e.g., 5 Geo. III. c. 15, forbidding the laying of filth in the streets of cities or county towns, and making regulations as to sweeping and scavenging. There were also numerous private Acts, dealing with water-supply and the obstruction of watercourses. In 1878 the existing legislation was consolidated by the Public Health (Ireland) Act, 1878 (41 and 42 Vict. c. 52), a close copy of the English Act of 1875. The list of statutory nuisances is the same in both Acts. The urban authority is the corporation, the commissioners, the municipal commissioners, or the town commissioners, according to circumstances. Ireland has its own local government board.

United States.—After the Civil War boards of health were established in the chief cities. Public health is under the control of the local authorities to a greater extent than in England. By the Act of Congress of 25th February 1799 officers of the United States are bound to observe the health laws of the States. A national board of health was created by the Act of 3d March 1879, c. 202. Its main duties are to give advice to local authorities and to carry on investigations in sanitary matters. It has certain jurisdiction in quarantine and in epidemics of a peculiarly dangerous nature. (J. Wt.)

PUBLIC RECORDS. See RECORDS, PUBLIC.

PUBLILIUS (less correctly written PUBLIUS) SYRUS, a Latin writer of farces (*mimi*), flourished in the 1st century B.C. He was a native of Syria and was brought as a slave to Italy, but by his wit and talent he won the favour of his master, who freed and educated him. His farces, in which he acted himself, had a great success in the provincial towns of Italy and at the games given by Cæsar in 46 B.C. Publilius appeared on the stage at Rome and received from Cæsar himself the prize for a histrionic contest in which the actor vanquished all his competitors, including the celebrated Laberius. For the rest, we learn from Jerome that in 43 Publilius still enthralled the Roman playgoers. Cicero witnessed with pleasure the exhibition of his plays, and Seneca was a warm admirer of his wise and witty sayings. All that remains of his works is a collection of *Sentences* (*sententiæ*), a series of moral maxims in iambic and trochaic verse. This collection must have been made at a very early date, since it was known to Aulus Gellius in the 2d century A.D. Each maxim is comprised in a single verse, and the verses are arranged in alphabetical order according to their initial letters. In course of time the collection was interpolated with sentences drawn from other writers, especially from apocryphal writings of Seneca; the number of genuine verses is about 700. They include many pithy sayings, such as the famous "judex damnatur ubi nocens absolvitur." The best editions of the *Sentences* are those of E. Wölfflin (Teubner, 1869) and W. Meyer (Teubner, 1880).

PÜCKLER-MUSKAU, HERMANN LUDWIG HEINRICH, PRINCE OF (1785-1871), a German author, was born at Muskau in Lusatia on 30th October 1785. He served for some time in the body-guard at Dresden, and afterwards travelled in France and Italy. In 1811, after the death of his father, he inherited the barony of Muskau and a considerable fortune. As an officer under the duke of Saxe-Weimar he distinguished himself in the war of liberation and was made military and civil governor of Bruges. After the war he retired from the army and visited England, where he remained about a year. In 1822, in compensation for certain privileges which he resigned, he was raised to the rank of prince by the king of Prussia. Some years earlier he had married the countess of Pappenheim, daughter of Prince Hardenberg; but he separated from her in 1826. He again visited England and travelled in America and Asia Minor, living after his return at Muskau, which he spent much time in cultivating and adorning. In 1845 he sold this estate, and, although he afterwards lived from time to time at various places in Germany and Italy, his principal residence was the castle of Branitz in the district of Kottbus, where he formed splendid gardens as he had already done at Muskau. In 1863 he was made an hereditary member of the Prussian Herrenhaus, and in 1866 he attended the Prussian general staff in the war with Austria. He died at Branitz on 4th February 1871, and, in accordance with instructions in his will, his body was burned. As a writer of books of travel he held a high position, his power of observation being keen and his style lucid and animated. His first work was *Briefe eines Verstorbenen* (1830-31), in which he expressed many independent judgments about England and other countries he had visited and about prominent persons whom he had met. Among his later books of travel were *Semilasso's vorletzter Weltgang* (1835), *Semilasso in Afrika* (1836), *Aus Mehemed-Ali's Reich* (1844), and *Die Rückkehr* (1846-48). He was also the author of *Andeutungen über Landschaftsgärtnerei* (1834).

See Pückler-Muskau's *Briefwechsel und Tagebücher*; Ludmilla Assing, *Fürst Hermann von Pückler-Muskau*; and Petzold, *Fürst Hermann von Pückler-Muskau in seiner Bedeutung für die bildende Gartenkunst*.

PUDSEY, a township of the West Riding of Yorkshire, is situated on an acclivity rising above the valley of the Aire and on the Great Northern Railway, 4 miles east of Bradford and 6 south-west of Leeds. The principal buildings are the church of St Lawrence in the Gothic style, erected in 1821 and lately improved, and the mechanics' institute, a fine building, comprising class-rooms, a library, a public hall, and a lecture hall. The town has an important woollen trade and possesses dyeing and fulling mills. Pudsey appears in Domesday as "Podechesaie." It was sold by Edward II. to the Calverley family, from whom it passed to an ancestor of the Milners. By the Bradford Water and Improvement Act of 1881 part (37 acres) of the urban sanitary district of Pudsey was amalgamated with that of Bradford. The population of the diminished district (2409 acres) in 1871 was 12,173, and in 1881 it was 12,314.

PUEBLA, or in full **LA PUEBLA DE LOS ANGELES**, a city of Mexico, formerly capital of the province of Tlaxcala, now of the state of Puebla, lies 76 miles south-east of Mexico, in 19° N. lat. and 98° 2' W. long., at a height of 7220 feet above the sea. It is admirably situated on a spacious and fertile plateau, which, while almost destitute of trees, is, especially in the neighbourhood of the city, clothed with gardens and fields. To the south-west rises the summit of Popocatepetl, and Orizaba and Iztaccihuatl are also within the horizon. By Humboldt Puebla was ranked as the most important city of Spanish America after Mexico, Guanajuato, and Havana, and in the matter

of population it still stands third among the state capitals. Its spacious streets run exactly east-west and north-south, and its houses, often of three stories, are solidly built of stone and in Spanish style. The cathedral, dedicated to the Immaculate Conception, was commenced in 1552 after the designs of Juan Gomez de Mora, but it was not completed until 1649, after Bishop Juan de Palafox y Mendoza had devoted eight years of strenuous effort to the enterprise. It is rather more than 320 feet long and 165 wide, and consists of a nave 80 feet high, with side aisles and a dome, the upper portion of which is constructed of pumice-stone for the sake of lightness. The main front, like the columns of the interior, is in the Doric style, but its two side towers are Ionic. In one is a great bell cast in 1637 and weighing upwards of 8 tons. Apart from the cathedral Puebla was famous for the number, and more especially for the lavish decoration of its churches, monasteries, and colleges. Several of these (such as the church and convent of Santo Domingo and the church of S. Felipe Neri) are still of note, and the city also contains a museum, a theatre, &c. Puebla has long been one of the great trading and manufacturing centres of the country, and it has recently become an important point in the rapidly-developing railway system, having in 1884 lines to Apizaco on the railway from Vera Cruz to Mexico (28 miles), to Villa de Libres (58 miles), to San Martin (24 miles), to Matamoros Izucar (31 miles), and to San Juan de los Llanos. Cotton and woollen goods, leather, earthenware, soap, and glass are the leading manufactures. The population, which was about 80,000 in 1746 and 52,717 in 1793, and which greatly decreased during the revolutionary period, is now (1885) stated at 75,000.

Puebla was founded in 1533-34 by Sebastian Ramirez de Fuenleal, archbishop of Santo Domingo, and the Franciscan friar Toribio Motolinia. In 1550 it became the seat of the bishopric which had originally been founded in 1526 at Tlaxcala. The epithet "de los Angeles," which is now practically dropped, was in the 17th and 18th centuries the chief part of the name, which often appears simply as Angeles. It is associated with a popular belief that during the building of the cathedral two angels every night added as much to the height of the walls as the workmen had managed to add in the preceding day. In 1845 Santa Anna made an unsuccessful attempt to capture the city. On 18th March 1863 it was invested by the French under Forey, and on 17th May taken by storm.

See Buschman's history of the city and cathedral in *Ztschr. f. allgem. Erdkunde*, 1868, vol. xv. pp. 195-212, and xvi. pp. 338-345.

PUERPERAL FEVER. See SEPTICÆMIA.

PUERTO CABELLO, a town and seaport in the South American republic of Venezuela, in the province of Carabobo, used to rank next to Cartagena, and possesses one of the finest natural harbours in that part of the world. It is backed at the distance of about 5 miles by a range of mountains 3000 feet high, across which pass, at a height of 1800 feet, the road (36 miles) and the railway now (1885) in course of construction to Valencia, the capital of the province. The old town used to lie on an island (originally a coral bank) joined to the mainland by a bridge; but since about 1850 the narrow channel between the town and the more extensive suburbs on shore has been filled up and covered with blocks of building, so that now Puerto Cabello occupies a kind of headland projecting into the bay. Formerly the lowness of its site and the mangrove swamps which fringed the whole coast rendered it appallingly unhealthy: at the time of Humboldt's visit, for example, the surgeon of the hospital reported that in seven years he had 8000 cases of yellow fever, and there were instances of the authorities having to take possession of vessels in the harbour because the entire crew had perished (Eastwick). But yellow fever has not been known at Puerto Cabello since about 1868, and the general death-rate of the place is quite normal. A good supply of water is obtained from the Rio Esteban by means of an aqueduct.

3 miles long. The harbour, about 2 miles long and from one-fourth of a mile to a mile in breadth, is formed by a narrow spit of land or coral ledge running out for about 2 miles from the coast in a northerly and westerly direction. The entrance, about 90 feet deep, is so clear that no pilot is required; and in the outer bay (100 to 300 feet deep) there is safe anchorage. On a high rock to the south-east of the town is the Mirador of Solano, or castle of Puerto Cabello, which has often proved an obstacle to enemies advancing from the interior. In 1883 the municipality, with a population of 12,000, contained a tannery, a foundry and machine-shop, a coffee-mill, two soap and candle factories, and about fourteen wholesale warehouses. The exports consist of coffee, cocoa, hides, goat and deer skins, bark, woods, indigo, and cotton, but only the first in large quantities. Germany and the United States are the chief recipients. Within 6 miles of the town there are four villages of from 200 to 1500 inhabitants.

See Jüls and Balleer, *Seehäfen der Erde*, Oldenburg, 1878; and *U.S. Consular Reports*, Nos. 24, 26, 30, &c.

PUERTO DE SANTA MARIA, probably the "Menesthei Portus" of Ptolemy, commonly called EL PUERTO ("The Port"), a town of Spain, in the province of Cadiz, 7 miles to the north-east of that city (21½ miles by rail; see sketch map, vol. iv. p. 627), near the mouth and on the right bank of the Guadalete, which is here crossed by a suspension bridge. It is a pleasant and well-built though somewhat dull town, in a fertile country, and its houses resemble those of Cadiz, though they are often larger and profusely decorated with painting. Calle Larga, the principal street, is handsome and well-paved; there are several "alamedas" or public promenades, that of La Victoria being the finest. The place is famous for its bull-fights, that given here in honour of Wellington being the subject of the considerably idealized description in Byron's *Childe Harold*. Among the public buildings is a large Jesuit college, recently established. Puerto is chiefly important as a wine-exporting place; the "bodegas" or wine-stores are large and lofty, but hardly equal to those of Xerez. The harbour is formed by the river; its mouth is considerably obstructed by a bar. There is regular steam communication with Cadiz. Timber and iron are the chief imports. The population of the municipality in December 1877 was 22,125.

PUERTO PRINCIPE, or now more correctly CIUDAD DEL PRINCIPE, a city at the head of the central department of the island of Cuba. When first founded in the beginning of the 16th century by Velazquez, it was, as its more familiar name implies, on the sea-coast; but it has been more than once shifted southward and inland, and is now nearly as far from the north as from the south side of the island. Though for some time after the surrender of San Domingo to France in 1800 Principe was the seat of the central government and supreme courts of the Spanish West Indies, it is no longer a place of much importance. The population is estimated at 31,000. Since 1840 the city has been connected by a railway with its port, which is sometimes called by its own name and sometimes by that of a smaller town on the bay about 11 miles from its entrance, San Fernando de Nuevitas. The harbour or bay is large, completely sheltered, and capable of admitting vessels of the largest draught; but it is entered by a narrow crooked passage 6 miles long, which, though there are no hidden dangers, makes the assistance of a pilot desirable.

PUERTO RICO. See PORTO RICO.

PUFENDORF, SAMUEL (1632-1694), was born at Chemnitz, Saxony, on the 8th of January 1632, the same year which also saw the birth of three other illustrious political and philosophical writers—Locke, Cumberland,

and Spinoza. He belonged to an ecclesiastical family; his father was a Lutheran pastor, and he himself was destined for the ministry. Having completed his preliminary studies at the celebrated school of Grimma, he was sent to study theology at the university of Leipsic, at that time the citadel of Lutheran orthodoxy. Its narrow and dogmatic teaching was profoundly repugnant to the liberal nature of the young student, who was not long in bidding adieu to the professors of theology and throwing himself passionately into the study of public law. He soon went so far as to quit Leipsic altogether, and betook himself to Jena, where he formed an intimate friendship with Erhard Weigel the mathematician, a man of great distinction. Weigel was imbued with the Cartesian philosophy; and it was to his teaching and to the impetus he gave to the application of the mathematical method that Pufendorf owes the exact and ordered mind, and the precision, frequently approaching almost to dryness, which characterize his writings. It was also under Weigel's influence that he developed that independence of character which never bent before other writers, however high their position, and which showed itself in his profound disdain for "ipsedixitism," to use the piquant phrase of Bentham.

Pufendorf was twenty-five years old when he quitted Jena. He hoped to find a career in some of the administrative offices which were so frequently the refuge of the learned in the small states of ancient Germany; but in this he was unsuccessful. In 1658, thanks to his eldest brother Isaiah, who had given up university teaching to enter the Swedish service, he went, in the capacity of tutor, into the family of Petrus Julius Coyet, one of the resident ministers of Charles Gustavus, king of Sweden, at Copenhagen. At this time Charles Gustavus was endeavouring to impose upon Denmark a burdensome alliance, and in the middle of the negotiations he brutally opened hostilities. The anger of the Danes was turned against the envoys of the Swedish sovereign; Coyet, it is true, succeeded in escaping, but the second minister, Steno Bjelke, and the whole suite were arrested and thrown into prison. Pufendorf shared this misfortune, and the future successor of Grotius was subjected to a strict captivity of eight months' duration. Like Grotius, he too had his Loevestein. The young tutor, deprived of books, occupied himself during his captivity in meditating upon what he had read in the works of Grotius and Hobbes. He mentally constructed a system of universal law; and, when, at the end of his captivity, he accompanied his pupils, the sons of Coyet, to the university of Leyden, he was enabled to publish the fruits of his reflexions under the title of *Elementa jurisprudentiæ universalis, libri duo*. The work was dedicated to Charles Louis, elector palatine, an enlightened prince and patron of science, who offered Pufendorf a chair of Roman law at Heidelberg, and when this was declined he created a new chair, that of the law of nature and nations, the first of the kind in the world. Pufendorf accepted it, and was thus in 1661, at the age of twenty-nine, placed in the most enviable of positions. He showed himself equal to his task, and by his science and eloquence proved himself to be an honour and an ornament to the university.

The keenly sarcastic tract *De statu imperii germanici, liber unus*, dates from this period of his life. Small in bulk, it is great in significance, and is one of Pufendorf's most important works. Written with the assent of the elector palatine, but published under the cover of a pseudonym at Geneva in 1667, it was supposed to be addressed by a gentleman of Verona, Severinus de Monzambano, to his brother Lælius. The pamphlet made a great sensation. Its author arraigned directly the organi

zation of the holy empire and exposed its feebleness, denounced in no measured terms the faults of the house of Austria, and attacked with remarkable vigour the politics of the ecclesiastical princes. But he did not thus describe the evil without at the same time suggesting the remedy. Thinking that Germany could not attain to a true monarchy without a great revolution, he proposed to call together a confederation, with a perpetual council representing all the members and occupying itself with external affairs. Before Pufendorf, Philipp Bogislaw von Chemnitz, publicist and soldier, had written, under the pseudonym of "Hippolytus a Lapide," *De ratione status in imperio nostro Romano-Germanico*. Inimical, like Pufendorf, to the house of Austria, Chemnitz had gone so far as to make an appeal to France and Sweden. Pufendorf, on the contrary, rejected all idea of foreign intervention. But in his plan, in which national initiative was all in all, were propounded the ideas of an army supported at the general expense, the secularization of the ecclesiastical principalities, the abolition of convents, and the expulsion of the Jesuits. His little book is perhaps the most important that was produced in relation to the public law and politics of Germany, and it is noteworthy that he reveals himself as a consummate statesman, having a broad comprehension of the present and a clear insight into the future. Subsequent events proved the justice of his conclusions.

In 1670 Pufendorf was called to the university of Lund. The influence of his brother Isaiah, as also some disagreements which he had had with his colleagues at Heidelberg, influenced his decision to accept the call; but by this acceptance he did not break with German culture, for in Scandinavia that culture was predominant. The sojourn at Lund was fruitful. In 1672 appeared the *De jure naturæ et gentium, libri octo*, and in 1675 a résumé of it under the title of *De officio hominis et civis*. The treatise *De jure naturæ et gentium* is the first systematic work on the subject. Grotius, whom Pufendorf has been accused of having too servilely followed, had more especially treated of international relations; and on the other hand Oldendorp, Hemming, and Winkler treated of the rudimentary part of the subject. Pufendorf took up in great measure the theories of Grotius and sought to complete them by means of the doctrines of Hobbes and of his own ideas. Judging of the work of Pufendorf as a whole, Mr Lorimer has felt justified in saying that "his conception was a magnificent one, and in the effort which he made to realize it he has left behind him a work which, notwithstanding the unpardonable amount of commonplace which it contains and its consequent dulness, is entitled to the respect of all future jurists. It was nothing less than an attempt to evolve from the study of human nature a system of jurisprudence which should be of universal and permanent applicability." The author derived law from reason, from the civil law, and from divine revelation, and established thus three "disciplines"—natural law, civil law, and moral theology. Natural law is all that is commanded to us by pure reason, and hence resulted the first important point in Pufendorf's theory, viz., that natural law does not extend beyond the limits of this life and that it confines itself to regulating external acts. Pufendorf combats Hobbes's conception of the state of nature, and concludes that the state of nature is not one of war but of peace. But this peace is feeble and insecure, and if something else does not come to its aid it can do very little for the preservation of mankind. As regards public law Pufendorf, while recognizing in the state (*civitas*) a moral person (*persona moralis*), teaches that the will of the state is but the sum of the individual wills that constitute it, and that this association explains the state. In this *a priori* con-

ception, in which he scarcely gives proof of historical insight, he shows himself as one of the precursors of J. J. Rousseau and of the *Contrat social*. On the subject of international law, with which he occupies himself incidentally, it is to be noted that Pufendorf belongs to the philosophical school, and also that he powerfully defends the idea that international law is not restricted to Christendom, but constitutes a common bond between all nations because all nations form part of humanity. As was to be expected, the work made a sensation: it provoked enthusiastic admiration as well as anger and indignation; the author was praised to the skies on the one hand, and accused of irreligion and atheism on the other. The universities of Lund and Leipsic, above all, furnished adversaries and critics. Being passionately attacked, he defended himself with passion, and he may be held to have come victorious out of these conflicts in which his combative and sarcastic soul delighted, for Pufendorf dearly loved a fray.

In 1677 he was called to Stockholm in the capacity of historiographer-royal. To this new period belong among others the work *On the Spiritual Monarchy of the Pope*, which was afterwards inserted in his *Introduction to the History of the principal States in Europe at the present Day*, also the great *Commentariorum de rebus Suevicis, libri XXVI., ab expeditione Gustavi Adolphi regis in Germaniam ad abdicationem usque Christianæ* and a *History of Charles Gustavus*. In his historical works Pufendorf is hopelessly dry; but he professes a great respect for truth and generally draws from archives. The treatise *On the Spiritual Monarchy of the Pope* alone recalls Severinus de Monzambano. There we find the same vigour and the same passion, and all through its pages we feel the indignation of the Protestant who sees the noble cause of religious liberty menaced by the papacy and by its two allies Louis XIV. and James II. Of the same nature is another work of this period, *De habitu religionis christianæ ad vitam civilem*, in which he undertakes to trace the limits between ecclesiastical and civil power, and where he expounds for the first time completely the theory known under the name of "Kollegial System" or "Kollegialismus," which was actually applied later in Prussia. This work is dated 1687. In 1688 Pufendorf was called to the service of Frederick William, elector of Brandenburg. He accepted the call; but he had no sooner arrived than the elector died. His son Frederick III. fulfilled the promises of his father, and Pufendorf, historiographer and privy councillor, was instructed to write *The History of the Elector William the Great*. The king of Sweden did not on this account cease to testify his goodwill towards Pufendorf, and in 1694 he created him a baron. In the same year, on the 26th of October, Pufendorf died at Berlin and was buried in the church of St Nicholas, where an inscription to his memory is still to be seen.

The value of the man whose life has been thus briefly sketched was great; he was at once philosopher, lawyer, economist, historian, we may even add statesman. His influence also was considerable, and he has left a profound impression on thought, and not on that of Germany alone. Posterity has, however, done him scant justice, and has not acknowledged what it really owes to him. Much of the responsibility for this injustice rests with Leibnitz, who would never recognize the incontestable greatness of one who was constantly his adversary. Everybody knows the bitter criticism which he made on Pufendorf, "*vir parum jurisconsultus et minime philosophus*." This is only the condensed expression of a multitude of judgments passed by him on the author of the *De jure naturæ et gentium*. It was on the subject of the pamphlet of Severinus de Monzambano that the quarrel began. The conservative and timid Leibnitz was beaten on the battlefield of politics and public law, and the aggressive spirit of Pufendorf aggravated yet more the dispute, and so widened the division. From that time the two writers could never meet on a common subject without attacking each other. The combat was almost always decided in favour of Pufendorf, but the irony of fate has ratified the words of his adversary,

and the future has accepted an estimate dictated by anger and spite.

PUFF-ADDER. See VIPER.

PUFF-BIRD, the name first given, according to Swainson (*Zool. Illustrations*, ser. 1, ii., text to pl. 99), by English residents in Brazil to a group of Birds known to ornithologists as forming the restricted Family *Bucconidae*, but for a long time confounded, under the general name of Barbets, with the *Capitonidae* of modern systematists, who regard the two Families as differing very considerably from one another. Some authors have used the generic name *Capito* in a sense precisely opposite to that which is now usually accorded to it, and the natural result has been to produce one of the most complex of the many nomenclatural puzzles that beset Ornithology. Fortunately there is no need here to enter upon this matter, for each group has formed the subject of an elaborate work—the *Capitonidae* being treated by the Messrs Marshall,¹ and the *Bucconidae* by Mr Sclater²—in each of which volumes the origin of the confusion has been explained, and to either of them the more curious reader may be confidently referred. The *Bucconidae* are zygodactylous Birds belonging to the large heterogeneous assemblage in the present work generally looked upon as forming the "Order" *Picariæ* (see ORNITHOLOGY, vol. xviii. p. 41), and commonly considered nowadays to be most nearly allied to the *Galbulidae* (JACAMAR, vol. xiii. p. 531), and like them confined to the Neotropical Region, in the middle parts of which, and especially in its Sub-Andean Sub-region, the Puff-birds are, as regards species, abundant; while only two seem to reach Guatemala and but one Paraguay. As with most South-American Birds, the habits and natural history of the *Bucconidae* have been but little studied, and of only one species, which happens to belong to a rather abnormal genus, has the nidification been described. This is the *Chelidoptera tenebrosa*, which is said to breed in holes in banks, and to lay white eggs much like those of the Kingfisher and consequently those of the Jacamars. From his own observation Swainson writes (*loc. cit.*) that Puff-birds are very grotesque in appearance. They will sit nearly motionless for hours on the dead bough of a tree, and while so sitting "the disproportionate size of the head is rendered more conspicuous by the bird raising its feathers so as to appear not unlike a puff ball. . . . When frightened their form is suddenly changed by the feathers lying quite flat." They are very confiding birds and will often station themselves a few yards only from a window. The *Bucconidae* almost without exception are very plainly-coloured, and the majority have a spotted or mottled plumage suggestive of immaturity. The first Puff-bird known to Europeans seems to have been that described by Marcgrave under the name of "*Tamatia*," by which it is said to have been called in Brazil, and there is good reason to think that his description and figure—the last, comic as it is in outline and expression, having been copied by Willughby and many of the older authors—apply to the *Bucco maculatus* of modern Ornithology—a bird placed by Brisson (*Ornithologie*, iv. p. 524) among the Kingfishers. But if so, Marcgrave described and figured the same species twice, since his "*Matuitui*" is also Brisson's "*Martin-pescheur tacheté du Brésil*."

Mr Sclater in his *Monograph* divides the Family into 7

genera, of which *Bucco* is the largest and contains 20 species. The others are *Malacoptila* and *Monacha* each with 7, *Nonnula* with 5, *Chelidoptera* with 2, and *Micromonacha* and *Hapaloptila* with 1 species each. The most showy Puff-birds are those of the genus *Monacha* with an inky-black plumage, usually diversified by white about the head, and a red or yellow bill. The rest call for no particular remark. (A. N.)

PUFFIN, the common English name of a sea-bird, the *Fratercula arctica* of most ornithologists, known however on various parts of the British coasts as the Bottlenose, Coulterneb, Pope, Sea-Parrot, and Tammy-Norie, to say nothing of other still more local designations, some (as Marrott and Willock) shared also with allied species of *Alcidae*, to which Family it has, until very lately, been invariably deemed to belong. Of old time Puffins were a valuable commodity to the owners of their breeding-places, for the young were taken from the holes in which they were hatched, and "being exceeding fat," as Carew wrote in 1602 (*Survey of Cornwall*, fol. 35), were "kept salted, and reputed for fish, as coming nearest thereto in their taste." In 1345, according to a document from which an extract is given in Heath's *Islands of Scilly* (p. 190), those islands were held of the crown at a yearly rent of 300 Puffins³ or 6s. 8d., being one-sixth of their estimated annual value. A few years later (1484), either through the birds having grown scarcer or money cheaper, only 50 Puffins are said (*op. cit.*, p. 196) to have been demanded. It is stated by both Gesner and Caius that they were allowed to be eaten in Lent. Ligon, who in 1673 published a *History of the Island of Barbadoes*, speaks (p. 37) of the ill taste of Puffins "which we have from the isles of Scilly," and adds "this kind of food is only for servants." Puffins used to resort in vast numbers to certain stations on the coast, and are still plentiful on some, reaching them in spring with remarkable punctuality on a certain day, which naturally varies with the locality, and after passing the summer there, leaving their homes with similar precision. They differ from most other *Alcidae* in laying their single egg (which is white with a few grey markings when first produced, but speedily begrimed by the soil) in a shallow burrow, which they either dig for themselves or appropriate from a rabbit, for on most of their haunts rabbits have been introduced. Their plumage is of a glossy black above—the cheeks grey, encircled by a black band—and pure white beneath; their feet are of a bright reddish orange, but the most remarkable feature of these birds, and one that gives them a very comical expression, is their huge bill. This is very deep and laterally flattened, so as indeed to resemble a coultter, as one of the bird's common names expresses; but moreover it is parti-coloured—blue, yellow, and red—curiously grooved and still more curiously embossed in places, that is to say during the breeding-season, when the birds are most frequently seen. But it had long been known to some observers that such Puffins as occasionally occur in winter (most often washed up on the shore and dead) presented a beak very different in shape and size, and to account for the difference was a standing puzzle. Many years ago Bingley (*North Wales*, i. p. 354) stated that Puffins "are said to change their bills annually." The remark seems

³ There can not be much doubt that the name Puffin given to these young birds, salted and dried, was applied on account of their downy clothing, for an English informant of Gesner's described one to him (*Hist. Avium*, p. 110) as wanting true feathers, and being covered only with a sort of woolly black plumage. It is right, however, to state that Caius expressly declares (*Rarior. animal. libellus*, fol. 21) that the name is derived "a naturali voce pupin." Prof. Skeat states that the word is a diminutive, which favours the view that it was originally used as a name for these young birds. The parents were probably known by one or other of their many local appellations.

¹ *A Monograph of the Capitonidae or Scansorial Barbets*, by C. H. T. and G. F. L. Marshall, London, 1870-71, 4to.

² *A Monograph of the Jacamars and Puff-birds, or Families Galbulidae and Bucconidae*, by P. L. Sclater, London, 1879-82, 4to.

to have been generally overlooked; but it has proved to be very near the truth, for after investigations carefully pursued during some years by Dr Bureau of Nantes he was in 1877 enabled to shew (*Bull. Soc. Zool. France*, ii. pp. 377-399)¹ that the Puffin's bill undergoes what may be called an annual moult, some of its most remarkable appendages, as well as certain horny outgrowths above and beneath the eyes, dropping off at the end of the breeding-season, and being reproduced the following year. Not long after the same naturalist announced (*op. cit.*, iv. pp. 1-68) that he had followed the similar changes which he found to take place, not only in other species of Puffins, as the *Fratercula corniculata* and *F. cirrhata* of the Northern Pacific, but in several birds of the kindred genera *Ceratorhina* and *Simorhynchus* inhabiting the same waters, and consequently proposed to regard all of them as forming a Family distinct from the *Alcidæ*—a view which has since found favour with Dr Dybowski (*op. cit.*, vii. pp. 270-300 and viii. pp. 348-350), though there is apparently insufficient reason for accepting it.

The name Puffin has also been given in books to one of the Shearwaters, and its Latinized form *Puffinus* is still used in that sense in scientific nomenclature. This fact seems to have arisen from a mistake of Ray's, who, seeing in Tradescant's Museum and that of the Royal Society some young Shearwaters from the Isle of Man, prepared in like manner to young Puffins, thought they were the birds mentioned by Gesner (*loc. cit.*), as the remarks inserted in Willughby's *Ornithologia* (p. 251) prove; for the specimens described by Ray were as clearly Shearwaters as Gesner's were Puffins. (A. N.)

PUGET, PIERRE (1622-1694), born at Marseilles on 31st October 1622, painter, sculptor, architect, and engineer, is a rare instance of precocious genius and mature power. At the age of fourteen he carved the ornaments of the galleys built in the port of his native city, and at sixteen the decoration and construction of a ship were entrusted to him. Soon after he went to Italy on foot, and was well received at Rome by Pietro di Cortona, who employed him on the ceilings of the Barberini palace and on those of the Pitti at Florence. In 1643 he returned to Marseilles, where he painted portraits and carved the colossal figure-heads of men-of-war. After a second journey to Italy he painted also a great number of pictures for Aix, Toulon, Cuers, and La Ciotat, and sculptured a large marble group of the Virgin and Child for the church of Lorgues. A serious illness in 1665 brought Puget a prohibition from the doctors which caused him wholly to put aside the brush. He now sculptured the caryatides of the town-hall of Toulon (Louvre), went to Normandy, where he executed a statue of Hercules and a group of Janus and Cybele for the marquis of Vaudreuil, and visiting Paris made the acquaintance of Le Pautre and Fouquet, who determined to employ him at Vaux and sent him to Italy to choose marbles for his work. The fall of Fouquet found Puget at Genoa, where he remained employed by the nobles of the town. There he executed for Sublet des Noyers his French Hercules (Louvre), the statues of St Sebastian and of Alexandre Sauli in the church of Carignano, and much other work. The Doria family gave him a church to build; the senate proposed that he should paint their council-chamber. But Colbert bade Puget return to France, and in 1669 he again took up his old work in the dockyards of Toulon. The arsenal which he had there undertaken to construct under the

orders of the duke of Beaufort was destroyed by fire, and Puget, disheartened, took leave of Toulon. In 1685 he went back to Marseilles, where he continued the long series of works of sculpture on which he had been employed by Colbert. His statue of Milo (Louvre) had been completed in 1681, Perseus and Andromeda (Louvre) in 1683, and Alexander and Diogenes (bas-relief, Louvre) in 1685; but, in spite of the personal favour which he enjoyed, Puget, on coming to Paris in 1688 to push forward the execution of an equestrian statue of Louis XIV., found court intrigues too much for him. He was forced to abandon his project and retire to Marseilles, where he remained till his death in 1694. His last work, a bas-relief of the Plague of Milan, which remained unfinished, was placed in the council-chamber of the town-hall.

Puget was the most vigorous representative of French sculpture in the 18th century; in spite of his visits to Paris and Rome his work never lost its local character: his Hercules is fresh from the galleys of Toulon; his saints and virgins are men and women who speak Provençal. His best work, the St Sebastian at Genoa, though a little heavy in parts, shows admirable energy and life, as well as great skill in contrasting the decorative accessories with the simple surface of the nude.

PUGIN, AUGUSTUS WELBY NORTHMORE (1812-1852), architect, was the son of Augustus Pugin, a native of France, who practised as an architect in London. He was born in Store Street, Bedford Square, on 1st March 1812. After completing the ordinary course of education at Christ's Hospital (blue-coat school), he entered his father's office, where he displayed a remarkable talent for drawing. When he had mastered the elements of his profession he devoted a large portion of his time to the sketching of public buildings; he also accompanied his father on several professional tours in France. While still very young he was employed by his father to design furniture in the mediæval style for Windsor Castle, and in 1831 he designed the scenery for the new opera of *Kenilworth* at Her Majesty's Theatre. Shortly afterwards he involved himself deeply in money difficulties by an attempt to establish a manufactory of stained glass, metal work, and furniture at Hart Street, Covent Garden. From the time, however, that he devoted himself steadily to his profession as an architect he never failed to find full employment. Shortly after his secession from the Church of England to that of Rome he published *Contrasts; or a Parallel between the Architecture of the 15th and 19th Centuries* (1836), in which he severely criticized the architecture of Protestantism. His other principal works are *True Principles of Christian Architecture* (1841), a *Glossary of Ecclesiastical Ornament* (1844), and a *Treatise on Chancel Screens and Rood Lofts* (1851). Pugin was the designer of a large number of important Roman Catholic buildings, and also assisted Sir Charles Barry in the preparation of the designs for the new Houses of Parliament, Westminster. Early in 1852 he was attacked by insanity, which caused his death on 14th September of the same year.

Future historians who may write the architectural history of the 19th century will probably describe as its leading characteristic that enthusiastic revival of the Gothic style which took place in the second quarter of the century and continued with unabated vigour for more than thirty years. Among the many able architects who during this period contributed to cover England with churches and other buildings, designed in a style which for three centuries had been rejected as barbarous, the name of Pugin deserves to be the most conspicuous. No man so thoroughly mastered the true principles of the Gothic style in its various stages, both in its leading lines and in the minutest details of its mouldings and carved enrichments, and that too at a time when illustrated works on Gothic architecture, such as have since been produced in enormous quantities,² had scarcely begun to exist; thus young Pugin had

¹ A translated abstract of this paper—containing an account of what is perhaps the most interesting discovery of the kind made in ornithology for many years—is given in the *Zoologist* for 1878 (pp. 238-240) and another in the *Bulletin of the Nuttall Ornithological Club* for the same year (iii. pp. 87-91).

² These numerous illustrated works, with every detail shown to a workable scale, by doing away with the necessity for studying the

to learn the alphabet of his chosen style by careful and laborious study of the glorious examples of Gothic, both ecclesiastical and domestic, in which England was then (far more than now) so extraordinarily rich. His father was for many years engaged in preparing a large series of works on the Gothic buildings of England, almost, if not quite, the first which were illustrated with accurate drawings of mediæval buildings; the early youth of A. W. Pugin was mostly occupied in making minute measured drawings for his father's books, and in this way his enthusiasm for Gothic art was first aroused. All through his life, both in England and during many visits to Germany and France, he continued to make, for his own instruction and pleasure, great numbers of drawings and sketches, especially in pen and ink, and with sepia monochrome. These are perhaps the most beautiful architectural sketches that have ever been produced, perfect in their delicacy and precision of touch, and masterpieces of skilful treatment of light and shade. They are mostly minute in scale, some almost microscopic in detail. Many of the Continental street scenes and interiors of cathedrals are of especial beauty from their contrasts of brilliant light and transparent shadow,¹ treated with Rembrandt-like vigour. At a very early age his wonderful mastery of Gothic detail was shown by the valuable aid he rendered to Sir Charles Barry in the construction of the new Houses of Parliament in 1836 and 1837.² For some time he worked as a paid clerk to Barry, and to Pugin is mainly due the very remarkable excellence of all the details in this great building, executed, it must be remembered, at a time when hitherto all examples of the revived Gothic were of the most ignorant and tasteless description. Pugin not only designed and even modelled a great part of the sculpture and other decorations of the building, but had actually to train a school of masons and carvers to carry out his designs with spirit and accuracy.³

While still young Pugin became a Roman Catholic, and this, if possible, increased his intense zeal and enthusiasm for Gothic, or, as he preferred to call it, Christian architecture. His profession became to him a sort of religion, and his study of mediæval buildings was closely associated with his love for the mystic symbolism and the highly æsthetic outward form of the old faith. The result of this was that he was almost wholly employed by adherents of the Catholic religion. In one way this was a fortunate circumstance, for it saved him from the temptation of assisting in that great wave of falsification and vulgarization which, under the name of "restoration," has devastated the principal mediæval buildings of Great Britain and Ireland. In another way it was unfortunate, for his Catholic employers were mostly much pinched for money, and at the same time so devoid of all sympathy for the principles of which he was the chief exponent, that they almost always insisted on the greatest possible amount of display being made in the cheapest possible manner. On account of this it is unfair to judge of Pugin's genius from a critical examination of his executed works. In almost every case his design was seriously injured, both by cutting down its carefully considered proportions and by introducing shams (above all things hateful to Pugin), such as plaster groining and even cast-iron carving. The cathedral of St George at Southwark, and even the church of the Jesuits in Farm Street, Berkeley Square, London, are melancholy instances of this. Thus his life was one series of disappointments; no pecuniary success compensated him for the destruction of his best designs, as in him the man of business was thoroughly subordinate to the artist. He himself used to say that the only church he had ever executed with unalloyed satisfaction was the one at Ramsgate, which he not only designed but paid for. Pugin was very broad in his love for the mediæval styles, but on the whole preferred what is really the most suited to modern requirements, namely, the Perpendicular of the 15th century, and this he employed in its simpler domestic form with much success both in his own house at Ramsgate and in the stately Adare Hall in Ireland, built for Lord Dunraven. The cathedral of Killarney and the chapel of the Benedictine monastery of Douai were perhaps the ecclesiastical buildings which were carried out with least deviation from Pugin's original conception.

He was a skilful etcher and produced a number of works illustrated in this way by his own hand, and written with much elo-

quence, antiquarian knowledge, and even brilliant humour. This last gift is exemplified in a series of etched plates in his *Contrasts*: on one side is some noble structure of the Middle Ages, and on the other an example of the same building as erected in the 19th century.⁴ His works on *Chancel Screens* and on *The True Principles of Christian Architecture* are very ably written and exquisitely illustrated.

Pugin's melancholy and premature end was to a great extent caused by the embittering influence of the constant frustration of his noblest artistic struggles and conceptions.

See Ben. Ferrey, *Recollections of A. Welby Pugin and his Father*, London, 1861.

PULCI, LUIGI, Italian poet, was born at Florence on 3d December 1431 and died in 1487. The first edition of his *Morgante Maggiore* appeared at Venice in 1481. (See ITALY, vol. xiii. p. 507 sq.)

PULGAR, FERNANDO DE, Spanish prose-writer of the latter part of the 15th century, born probably at Pulgar near Toledo, was brought up at the court of John II. Henry IV. made him one of his secretaries, and under Isabella he became a councillor of state, was charged with at least one mission to France, and in 1482 was appointed historiographer-royal. His official *Chronicle* of the reign of the Catholic sovereigns for the period previous to his appointment is loose and inaccurate; but in the later portion, where he had the advantage of personal knowledge, he is always precise and often graphic. It is not brought down beyond the year 1492. It was first printed at Valladolid in 1565 under the name of Antonio de Lebrija. Pulgar's *Claros Varones de Castilla*, a series of sketches of forty-six of the most celebrated men of the reign and court of Henry IV., is of considerable interest both for its matter and for its style. He wrote, besides, a commentary on the ancient *Coplas de Mingo Revulgo*; and thirty-two of his *Letters* written to various persons of eminence, including some to the queen, are also extant. The first edition of the *Claros Varones* was that of Seville (1500); some of the letters did not appear until 1528.

PULLEY. See MECHANICS and BLOCK MACHINERY.

PULTENEY, WILLIAM, EARL OF BATH (1684-1764), a politician elevated by a living historian⁵ into the important position in history of the first leader of the opposition, was descended from an ancient family with a pedigree duly recorded in Nichols's *History of Leicestershire* (iv. 320). His father, William Pulteney, died in 1715, and the future statesman was the offspring of his first wife, Mary Floyd, and was born in 1684. As his grandfather had been intimately connected with the city of Westminster, the boy was sent to Westminster school and from it proceeded to Christ Church, Oxford, acquiring in these institutions that deep classical knowledge which adorned his own speeches and enabled him to correct his great antagonist when he blundered in a quotation. On leaving Oxford he made the usual tour on the Continent. In 1705 he was brought into parliament by Henry Guy for the Yorkshire borough of Hedon, and at the death of that gentleman (a politician who had at one time held the office of secretary of the treasury) Pulteney inherited an estate of £500 a year and £40,000 in cash. This seat was held by him without a break until 1734, and though the family was then dispossessed for a time the supremacy was regained in the return of another Pulteney in 1739. Throughout the reign of Queen Anne William Pulteney played a prominent part in the struggles of the Whigs, and on the prosecution of Sacheverell he exerted himself with great zeal against that violent divine. When the victorious Tories sent his friend

¹ Three volumes of photographs of these sketches have been published in a square octavo form, but have suffered from reduction in size.

² A comparison of the decorations of the Houses of Parliament with other contemporary and even later Gothic buildings shows in a very striking way the remarkable talent and industry displayed by Pugin in the work.

³ A few years ago very ill-judged attempts were made to claim for Pugin the main credit of Barry's design—claims which he himself would have been the last to raise.

⁴ Pugin's sense of humour was keener than is altogether convenient for a man of business; on one occasion when a certain Catholic bishop wrote asking him to design a handsome church, which was to cost an absurdly small sum of money, he replied, "My lord, say thirty shillings more and have a tower and spire."

⁵ Justin M'Carthy, *History of the Four Georges*, vol. i. (1884).

Robert Walpole to the Tower in 1712, Pulteney championed his cause in the House of Commons and joined with the leading Whigs in visiting him in his prison-chamber. For these acts he was duly rewarded on the accession of George I. In the first ministry of the new king he held the post of secretary of war, a post which in the previous reign had been conferred upon St John, Walpole, and Granville successively, and when the committee of secrecy on the Utrecht treaty was formed the list included the name of William Pulteney. Two years later (6th July 1716) he became one of the privy council. In the following year the Whig ministry was rent in twain by internal dissension. On the proposition of the Government for granting a supply against Sweden the friends of Lord Townshend and Sir Robert Walpole voted against the administration, which only escaped defeat by a majority of four. Townshend was immediately dismissed from his post of lord-lieutenant of Ireland, and Walpole at once resigned his places, and amongst the Whigs who followed him in his retirement was Pulteney. Devotion like this merited some signal mark of favour on the return to power of the displaced ministers; yet, when the crash of the South Sea Company restored Walpole to the highest position of authority, all that he offered to Pulteney was a peerage, a distinction which entailed the misfortune of banishment from the House where his faculties found their highest opportunities for display. The offer was rejected, but in 1723 Pulteney stooped to accept the lucrative but insignificant post of cofferer of the household. In this obscure position he was content for some time to await the future; but when he found himself neglected he broke out into sarcasms on the civil list and in 1725 was dismissed from his sinecure. From the day of his dismissal to that of his ultimate triumph Pulteney remained in opposition, and, although Sir Robert Walpole attempted on his quarrel with Townshend to conciliate him, all his overtures were spurned. Pulteney's resentment was not confined to his speeches in parliament. With Bolingbroke he set on foot the well-known periodical called *The Craftsman*, and in its pages the minister was incessantly denounced for many years. The war of pamphlets raged without ceasing. Lord Hervey published an attack on the *Craftsman*, and Pulteney, either openly or behind the person of Amhurst, defended its strictures of the minister. Whether the question at issue was the civil list, the excise, the income of the prince of Wales, or the state of domestic affairs Pulteney was ready with a pamphlet, and the minister or one of his friends came out with a reply. For one of these efforts he was challenged to a duel by Lord Hervey; for another he was struck off the roll of privy councillors and dismissed from the commission of the peace in several counties. In print Pulteney was inferior to Bolingbroke alone among the antagonists of Walpole, but in parliament, from which St John was excluded, he excelled all his comrades. When the sinking fund was appropriated his voice was the foremost in denunciation; when the excise scheme was stirring popular feeling to its lowest depths the passion of the multitude broke out in his oratory. Through Walpole's prudent withdrawal of the latter measure the fall of his ministry was averted, and dismay fell on the opposition leaders. Bolingbroke withdrew to France and Pulteney sought consolation in foreign travel.

From the general election of 1734 until his elevation to the peerage Pulteney sat for Middlesex. For some years after this election the minister's assailants made little progress in their attack, but in 1738 the troubles with Spain supplied them with the opportunity which they desired. Walpole long argued for peace, but he was feebly supported in his own cabinet, and the frenzy of the people for war knew no bounds. In an evil moment for

his own reputation he consented to remain in office and to gratify popular passion with a war against Spain. His downfall was not long deferred. War was declared in 1739; a new parliament was summoned in the summer of 1741, and over the division on the election petitions the ministry of Walpole fell to pieces. The task of forming the new administration was after some delay entrusted to his principal antagonist, whereupon Pulteney offered the post of first lord of the treasury to that harmless politician the earl of Wilmington, being content himself, as he had often declared his disdain for office, with a seat in the cabinet coupled with a peerage. At this act popular feeling broke out into open indignation. Exclamations that the country was betrayed were heard on all sides, and from the moment of his elevation to the Upper House Pulteney's influence dwindled to nothing. Horace Walpole asserts that when Pulteney wished to recall his desire for a peerage it was forced upon him through the ex-minister's advice by the king, and another chronicler of the times records that when victor and vanquished met in the House of Lords, the one as Lord Orford, the other as the earl of Bath, the remark was made by the exulting Orford: "Here we are, my lord, the two most insignificant fellows in England." On 14th July 1742 Pulteney was created baron Pulteney of Hedon, county York, viscount Pulteney of Wrington, county Somerset, and earl of Bath, and a few months previously he had been restored to his rank in the privy council. On Wilmington's death in 1743 he made application to the king for the post of first lord of the treasury, only to find that it had been conferred on Henry Pelham. For two days in 1746 he was at the head of a ministry, but in "48 hours, three quarters, seven minutes, and eleven seconds" this short-lived ministry collapsed. An occasional pamphlet and an unfrequent speech were afterwards the sole fruits of Lord Bath's talents. His praises whilst in retirement have been sung by two prelates of the established church of England, Bishops Pearce and Newton. He died on 7th July 1764, and was buried on 17th July in his own vault in Islip chapel, Westminster Abbey.

Pulteney's eloquence was keen and incisive, sparkling with vivacity and with allusions drawn from the literature of his own country and of Rome. Of business he was never fond, and the loss in 1731 of his trusted friend John Merrill, who had supplied the qualities which he lacked, was feelingly lamented by him in a letter to Swift. His chief weakness was a passion for money, which was born with him and grew as he grew. As he left no surviving issue¹ his vast fortune went to William Johnstone of Dumfries (the third son of Sir James Johnstone), who had married Frances, the daughter and heiress of his cousin Daniel Pulteney, and had taken the name of Pulteney. Lord Bath has left no trace of the possession of practical statesmanship, but for nearly twenty years he led the opposition in the House of Commons to the greatest minister of the age, and had at last the triumph of driving his adversary from office.

(W. P. C.)

PULTOWA. See POLTAVA.

PUMA, a name, probably of native origin, introduced into European literature by the early Spanish writers on South America (as Garcilaso de la Vega and Hernandez), for one of the largest feline animals of the New World. It is generally called "cougouar" by the French, "leon" by the Spanish Americans, and "panther" by the Anglo-American hunters of the United States. It is the *Felis concolor* of Linnæus and all subsequent systematic zoological authors. In general and anatomical characters, teeth, &c., it is a typical member of the genus *Felis*. (See MAMMALIA, vol. xv. p. 434.) Though often spoken of as the American lion, chiefly on account of its colour, it rather resembles the leopard of the Old World in size and habits. It usually measures from nose to root of tail about 40.

¹ His wife, Anna Maria Gumley, daughter of John Gumley of Isleworth, usually styled "a wealthy glass manufacturer and army contractor," died on 14th September 1758, aged sixty-four.

inches, the tail being rather more than half that length. The head is rather small compared with that of other cats and has no mane. The ears are large and rounded. The tail is cylindrical, with some bushy elongation of the hairs near the end, but not forming a distinct tuft as in the lion. The general colour of all the upper parts and sides

Puma.

of the adult is a tawny yellowish brown, sometimes having a grey or silvery shade, but in some individuals dark or inclining to red. The lower parts of the body, inner surface of the limbs, the throat, chin, and upper lip are dirty white; the outside of the ears, particularly at their base, and a patch on each side of the muzzle black; the end of the tail dusky. The young, as is the case with the other plain-coloured *Felidæ*, are, when born, spotted with dusky brown and the tail ringed. These markings gradually fade, and quite disappear before the animal becomes full-grown.

The puma has an exceedingly wide range of geographical distribution, extending over a hundred degrees of latitude, from Canada in the north to Patagonia in the south, and was formerly pretty generally diffused in suitable localities from the Atlantic to the Pacific Ocean, but the advances of civilization have in recent years considerably curtailed the extent of the districts which it inhabits. In Central America it is still common in the dense forests which clothe the mountain ranges as high as 8000 or 9000 feet above the sea-level, where the hideous sound of its howling is said to be almost continuously heard at night during the breeding season. Though an expert climber, it is by no means confined to wooded districts, being frequently found in scrub and reeds along the banks of rivers, and even in the open pampas and prairies. Its habits much resemble those of the rest of the group to which it belongs; and, like the leopard, when it happens to come within reach of an abundant and easy prey, as the sheep or calves of an outlying farming station, it kills far more than it can eat, either for the sake of the blood only or to gratify its propensity for destruction. It rarely attacks man, and, when pursued, escapes if possible by ascending lofty trees. Several instances have occurred of pumas becoming tame in captivity. Edmund Kean, the celebrated actor, had one which followed him about like a dog. When caressed they express their pleasure by purring like a domestic cat.

PUMICE, a highly porous light mineral substance of volcanic origin, resulting from the solidification of foam or scum formed by the escape of steam or gas on the surface of molten lava. It is principally found of a whitish or clear

grey colour, more rarely of a slaty blue or reddish tint. In composition it is allied to the obsidians, containing in every 100 parts about 72 of silica, 17 of alumina, 2 of iron oxide, and 9 of soda and potash; and under the blow-pipe it fuses to a white enamel. Its porosity renders it so exceedingly light that in the dry condition it floats readily on the surface of water, sinking only when thoroughly saturated. Owing to this property it is found very widely diffused over the ocean-bed, even at points far removed from volcanic vents, considerable blocks having been brought up in the dredgings of the "Challenger" at all the points of its sea-bottom exploration. It is obtained for industrial purposes in the regions of recent volcanoes—the Lipari Islands, Iceland, Auvergne, Teneriffe, &c.—and is highly valued as a smoothing and polishing material for the metals, marble, horn, wood, bone, ivory, and leather. For some purposes it is reduced to the condition of a fine powder, and used either direct or spread upon paper or linen, as glass or emery-paper. A toilet soap is prepared containing a proportion of powdered pumice. An artificial pumice is made from a mixture of calcined and pulverized quartz and alumina baked in the form of a porous brick.

PUMP. See **MINING**, vol. xvi. pp. 458, 459; **PNEUMATICS**, vol. xix. p. 246; and **HYDROMECHANICS**, vol. xii. p. 533 *sq*.

PUMPKIN. See **GOURD**, vol. xi. p. 4, and **HORTICULTURE**, vol. xii. p. 283.

PUNCHINELLO (It. *Policinella*, *Pulcinella*), the most popular of the puppets, is of Italian origin, though its history is by no means free from obscurity. The earlier etymologists sought to trace the name to various mythical individuals, by whom, it was alleged, the type was first furnished. Galiani adopts the theory which derives it from the name of Puccio d'Aniello, a vintager of Acerra near Naples, who, having by his wit and grotesque appearance vanquished some strolling comedians in their own sphere, was induced to join the troop, and whose place, by reason of his popularity, was supplied after his death by a masked actor who imitated his dress and manner. The claims of other individuals—Paolo Cinella, Polliceno, and Pulcinella, a Neapolitan dealer in fowls—have also found supporters, and the derivation of the name and character from some old mystery representing Pontius (O.E. *Pownce*; Fr. *Ponce*) Pilate and Judas, or the Jews, was formerly popular. It has even been suggested that the title is a modification of *πολύ κινέω* as expressive of the restlessness which is characteristic of the puppet; and the assumption that the character was invariably of diminutive size has given rise to its reference to the word *pollice*, the thumb (cf. *Däumling*, Tom Thumb). The most plausible theory, however, regards the name in its Italian form as a diminutive of *pulcino*, fem. *pulcina*, a chicken. It is sometimes stated that, in consequence of the habit of using the word "chicken" as a term of endearment, it came to mean "a little child," and hence "a puppet" (Skeat). But this again involves the assumption that the application of the name to the character was in some measure determined by the size of the puppets, whereas it would appear to have been transferred from the comic stage to the puppet show, and the Pulcinella of the stage was not necessarily a dwarf. The choice, therefore, seems to lie between the theory of Quadrio, that it was applied on account of the resemblance of the hooked nose to a beak, and that of Baretti, which ascribes its employment to the nasal squeak and timorous impotence of the original character. With respect to the development of the modern type, it has been assumed that the whole family of Italian *maschere* (Arlecchino, Brighetta, and the like) are modified survivals of the principal Oscan characters of the *Atellaneæ*, and that Punchinello is the representative of Maccus, the fool or clown. In proof of

this it is urged that Acerra, the supposed residence of Puccio d'Aniello and the traditional source of the character, is in the neighbourhood of Aversa, the old Atella; and reference is also made to a bronze statue of Maccus, discovered at Rome in 1727, an engraving of which has been preserved in Ficoroni's *Le Maschere Sceniche e le Figure Comiche d'Antichi Romani*. But the resemblance of the statue to the puppet is scarcely to be termed a striking one, and the large nose and deformed figure are somewhat hazardous ground on which to base a theory,—especially in view of the fact that such points of likeness as there are in it to the northern Punch are not to be found in the Neapolitan Pulcinella. It is possible that some relic of the old *Ludi Osci*, transmitted through the Vice of the mystery plays, is to be found in the character; but any direct descent from the Maccus of the Atellanæ seems precluded by the fact that, while there are traces of the gradual development of the northern Punch from the Neapolitan Pulcinella, the latter with its grey hat, white smock and trousers, masked face, and undistorted body is widely different from its alleged prototype. It seems necessary, therefore, to regard the Pulcinella as in large part a distinct creation of comparatively modern date. Prior to the 17th century there is no indication in the Italian burlesque poets of the existence of Pulcinella, though Riccoboni places the creation of the part before 1600.

Andrea Perrucci (1699) and Gimma assert with some show of authority that Silvio Fiorillo, a comedian named after his principal part Captain Matamoros (the Italian *Miles Gloriosus*), invented the Neapolitan Pulcinella. It was afterwards improved by Andrea Calcese, surnamed Ciuccio, who died of the plague in 1656, and who, according to Gimma, imitated in the character the peasants of Acerra. This would place the origin of the Italian Pulcinella somewhere about the commencement of the 17th century, the original character appearing to have been that of a country clown, hook-nosed, shrill-voiced, cowardly, boastful, and often stupid, yet given at times to knavish tricks and shrewd sayings. In thorough accordance with this date, we find that the earliest known appearance of Polichinelle in France is at the commencement of the reign of Louis XIV., in the show of the puppet-playing dentist Jean Brioché. It might have been expected that the shrewder and wittier side of the character would most commend itself to the French mind, and there is good reason to believe that the Polichinelle of Brioché was neither a blunderer nor a fool. The puppet was almost immediately seized upon as the medium of political satire of the kind exemplified in the *Letter of Polichinelle to Cardinal Mazarin* (1649), and it is described in the *Combat de Cyrano de Bergerac* as a "petit Ésope de bois, remuant, tournant, virant, dansant, riant, parlant, petant" and as "cet hétéro-clite marmouset, disons mieux, ce drolifique bossu." In this there appear signs of transformation, whether the importation to France took place before or after the alleged improvements of Calcese. The hunchback had been long associated in France with wit and laughter, and there are, therefore, some grounds for Magnin's theory that the northern Punch is of French origin, a Gallic type under an Italian name, though there does not seem to be sufficient reason for adopting his suggestion that Polichinelle was a burlesque portrait of Béarnais. The date of its introduction into England has been disputed, Payne Collier being of opinion that Punch and King William came together, a second theory suggesting an earlier origin with the Huguenot refugees. In view of its popularity in France prior to the Restoration, however, it would be strange if its migration had been so long delayed, and it is more than probable that it crossed the Channel in the

wake of the Royalists. Apart from the general references by Pepys (1662) and by Evelyn (1667) to an Italian puppet-show at Covent Garden, the former makes mention (1669) of some poor people who called their fat child Punch, "that word being become a word of common use for all that is thick and short." An allusion to "Punchinello" is also to be found in Butler's satire on English imitation of the French, and Aubrey speaks of "a Punchinello holding a dial" as one of the ornaments of Sir Samuel Lely's house at Whitehall. But, though the puppet did not travel in the train of William of Orange, allusions to it become far more frequent after the Revolution of 1688, and the skill of the Dutch in their treatment of puppet mechanism may have enhanced its attractiveness. In 1703 it was introduced at Bartholomew Fair into a puppet play of the creation of the world; in 1709 (*Tatler*, No. 16) it was to be found in a representation of the Deluge, though in a different part from that of the Momus Polichinelle of Piron's *Arlequin-Deucalion* (1722); and in 1710 (*Spectator*, No. 14) it is mentioned as a leading figure in Powell's puppet-show at Covent Garden. The alleged satire on Robert Walpole, entitled *A Second Tale of a Tub, or the History of Robert Powel, the Puppet-Showman* (1715), furnishes some details of Punch performances, and has an interesting frontispiece representing Powell with Punch and his wife. The Judy (or Joan, as she appears to have been sometimes called) is not of a specially grotesque order, but the Punch is easily recognizable in all but the features, which are of the normal puppet type. Other allusions are to be found in Gay's *Shepherd's Week—Saturday* (1714) and Swift's *Dialogue between Mad Mullinix and Timothy* (1728). The older Punchinello was far less restricted in his actions and circumstances than his modern successor. He fought with allegorical figures, representing want and weariness as well as with his wife and with the police, was on intimate terms with the patriarchs and the seven champions of Christendom, sat on the lap of the queen of Sheba, had kings and dukes for his companions, and cheated the Inquisition as well as the common hangman. Powell seems to have introduced a trained pig which danced a minuet with Punch, and the French have occasionally employed a cat in place of the dog Toby, whose origin is somewhat uncertain. A typical version of the modern play, with illustrations, was published by Payne Collier and Cruikshank in 1828. (R. M. W.)

PUNCTUATION. See PALÆOGRAPHY, vol. xviii. p. 163.

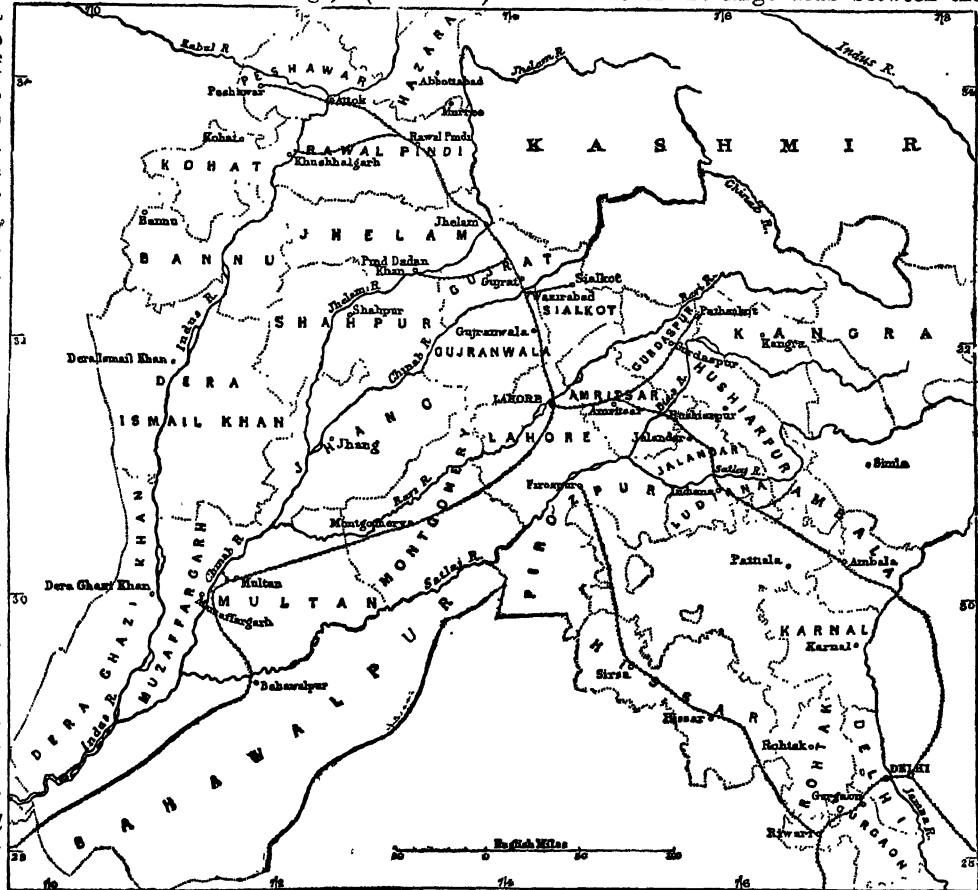

PUNJAB,¹ the most northern province of British India. Geographically the region called by this name is the triangular tract of country of which the Indus and the Sutlej (Satlej) to their confluence form two of the sides, the third being the lower Himálaya hills between these two rivers. The British province now includes a large extent of country outside these boundaries, on all three sides—beyond the Indus to the range of hills running parallel to it on the west; beyond the Sutlej eastward to the Jumna (Jainna) and southward to a distance of 60 miles below Delhi; within the hills, a large highland tract on the east and another on the west, with the Kashmir and Chamba territories between. The British province stretches north and south from 35° 10' N. lat. at the head of the hill district of Hazára to 27° 40' at the south end of the Gurgáon district, and east and west from 69° 36' E. long. on the Dera Gházi Khán and Sind frontier to 78° 55' on the Jumna. The length of the central line of communication across the province from Delhi to Peshawar by rail is 645 miles.

The name *Punjab* signifies "[country of] five rivers," *Rivera*.

¹ *Panjab*, according to received modern spelling; but, as in other cases of important and familiar names, the old form is commonly retained.

the five rivers being the great tributaries of the INDUS (*q.v.*), namely, the Jhelum, Chináb, Rávi, Biás, and Sutlej.¹ These are all rivers of large volume, but, on account of the great width of sandy channel in their passage through the plains, their changing courses, and shifting shoals, they are of very moderate value for steam navigation, though they all support a considerable boat-traffic. The Indus has a course of about 550 miles through the Punjab. The Jhelum enters the plains a little above the town of Jhelum. Thence it flows south-west about 200 miles to join the Chináb. The Chináb (called Chandrabhága in the hills, being formed by the union of the Chandra and the Bhága, both from the Bára Lácha Hills) enters the Punjab about 15 miles north of Sialkót. About 200 miles lower down it receives the Jhelum on the right, and about 60 miles farther the Rávi on the left. After a further course of about 120 miles it joins the Sutlej. The Rávi, after reaching the plains, follows a very winding course to its junction with the Chináb. A deserted channel runs generally parallel to the present river through part of the district of Montgomery. The Biás enters the Punjab in the Gurdáspur district, and has a course in the plains of nearly 100 miles to its junction with the Sutlej near Hari-ki-Patan. The Sutlej flows nearly 500 miles through the plains before it unites with the Chináb, which is the junction of the five tributaries. Thence the united rivers (sometimes called *Pan-jnad* or "the five streams") flow in one channel about 50 miles to the Indus.

adjoining rivers. The country between the Sutlej and the Biás is called the Jalandar Doáb; it includes the districts Jalandar and Hushiárpur. The long strip between the Biás-Sutlej and the Rávi, containing the greater part of the Gurdáspur, Amritsar, Lahore, Montgomery, and Múltán districts, is called the Bári Doáb. And Rechna Doáb is the tract between the Rávi and the Chináb, embracing the Sialkót and Gujranwála districts with the trans-Rávi portions of the districts of the Bári Doáb. Chaj or Jach is the doáb between the Chináb and the Jhelum (Gujrát and Sháhpur districts and part of Jhang), and Sind Sagar (Indus Sea) is the name of the large doáb between the

Map of Punjab.

Doábs.

Whilst the general name Punjab is applied to the whole country of the five rivers, there are distinct names for each of the "doábs" (*do*, two; *áb*, water) or tracts between two

¹ The name first given by the Aryans after their immigration was *Sapta Sindhú*, "[land of] seven rivers," these being the five rivers of the modern Punjab with the addition of the Indus on the one side and of the Saraswati on the other. In the Vedic poems they are severally addressed as *Sindhú*, the Indus (*the river*); *Vitasta*, the Jhelum; *Asikni*, Chináb; *Airavati* and *Marudvridha*, Rávi; *Vipása*, Biás; *Sutudri*, Sutlej; and *Saraswati*, Sarsuti. It may be remarked that *Sindhú* itself means "river," and *Saraswati*, "having running water," and that each is applied as an epithet to other great rivers. The Saraswati, alone of the seven, is not now great. It is represented by a channel or channels, occupying the position assigned to the ancient much-praised stream, but now nearly dry for a great part of the year; for, unlike the others, it comes only from the lower hills, not from perpetual snows. The large body of water which it carries for a time in the rainy season never reaches the Indus, towards which it directs its course, but is lost in the desert lands of northern Rájputána and Baháwalpur. In writings of the 6th or 7th century B.C. the Saraswati is said to disappear and pass underground to join the Ganges and Jumna at Prág (Allahábád), which triple confluence received therefore the name *Tribeni*. The Saraswati dropped out of the enumeration of the rivers of the early Aryan settlement; and, when in later days the Indus, which receives all the others, ceased to be reckoned along with them, the country took its name *Panchanada*, and afterwards, in Persian form, *Panjab*.

Jhelum and the Indus, including the Ráwal Pindi, Jhelum, and Muzaffargarh districts, with parts of Sháhpur, Bannú, Dera Ismail Khán. The higher and drier parts of the doábs are called "bár." They are waste but not barren, scantily covered with low shrubs, capable, when watered, of being well cultivated. The bár is the great camel-grazing land. Large areas of the Muzaffargarh and Múltán districts are "thal," barren tracts of shifting sand. The middle part of the Bári Doáb, in the Amritsar district, bears the distinctive name of *Mánjha* (middle) as the centre and headquarters of the Sikh nation, containing their two sacred tanks of Amritsar and Taran Taran, and a dense and fine population of Játs, Rájputs, and Gújars. The Malwa Sikhs, again, are those of the cis-Sutlej country.

Besides the great rivers, the distinguishing feature of Minor the Punjab, there are some others deserving of notice. rivers. The Cabul river joins the Indus above Attock after receiving, about 12 miles north-east of Peshawar, the Swát river, which enters British territory at Abazai. The Kunhár, from the Kashmir hills, flows down the Kaghan valley (the upper part of the Hazára district) and joins the Jhelum at Muzaffarábád. The Siran and the Dór in Hazára unite and near Torbéla run into the Indus, which

below Attock also receives the Harro from Hazára. The Kurram, rising in Afghanistan and flowing through the Bannú district, falls into the Indus near Isa Khil, and the Sohán, from the lower hills of Kashmir, joins it above Kálábágh. The Bimbar, from the Kashmir Hills, below the Pír Panjál Pass, runs into the Chináb near Wazirábád. The Dég, from the Jammú Hills, joins the Rávi near Gugaira. South of the Sutlej the Markanda, the Saraswati, the Gaggar, and the Chitang, from the lower hills of Sirmur, which are violent torrents during the rainy season but nearly dry at other times, flow towards the Indus, but never reach it, being lost in the sands of the Bikanér and Baháwalpur desert.

Area. The area of the Punjab proper, the triangular tract of country between the Indus and the Sutlej, is about 62,000 square miles; the whole area of the British province is 106,632, and of the feudatory states 35,817, making a total of 142,449 square miles. This area is for the most part a great alluvial plain. The north-east side of the province is a belt of hill-country, the outer margin of the Himálayas, on which are the valuable hill-stations of Murree, Dalhousie, Dharmasala, Kassauli, Sabáthú, Dagshai, and Simla. In the Delhi and Gurgáon districts is the north end of the Aravali range. A part of the extremity of these hills became well known at the time of the siege of Delhi in 1857 under the name of the "Ridge," which was held by the British troops. Between the Jhelum and the Indus is the hilly region known by the general name of the Salt Range, containing the inexhaustible stores of rock-salt which have been worked for many centuries. The salt is dug from enormous caverns entered by narrow tunnels. The salt-hills are continued west of the Indus, where the salt is dug from open quarries. A double range of low hills runs south-westward from the Indus near the mouth of the Kurram. The part near the south end called Sheikh Budín (Sheikh Shaháb-uddín) is a useful sanatorium, though of no great height or great extent. The western boundary of the province is the fine range of the Sulimán Mountains, dividing the Punjab from Afghanistan. The British possessions do not extend beyond the base of the hills, which are occupied by very independent tribes. It is only within a short time past that any exact knowledge has been obtained of the interior of these hills, beyond the parts visited in the course of the numerous frontier expeditions for the punishment of inroads into British territory. A survey was made for the first time in 1883 of the fine mountain mass containing the snowy peak Takht-i-Sulimán (Solomon's throne) and its surroundings.

Mineral products. Besides the rock-salt the mineral products of the Punjab are not many. Limestone, good for building, is obtained at Chaniót on the Chináb and at a few other places. There are extensive alum-beds at Kálábágh on the Indus. A small quantity of coal is found in the Salt Range in disconnected beds, mostly at a considerable height above the plain, and not very accessible, the beds thinning out westwards from the Jhelum to the Indus. Petroleum is found in small quantities at a number of places in the Ráwal Pindí, Kohát, and Bannú districts, being gathered from the surface of pools or collected in shallow pits. It is used for making gas for the station of Ráwal Pindí. In almost all parts of the Punjab there is "kankar," rough nodular limestone, commonly found in thick beds, a few feet below the surface of the ground, used for road metalling and burned for lime.

Crops, &c. As in other parts of India, there are commonly two harvests in the year. The spring crops are wheat, barley, gram, various vegetables, oil-seeds, tobacco, and a little opium; the autumn crops, rice, millets, maize, pulses, cotton, indigo, and sugar-cane. Tea is now extensively

cultivated in the Kángra district. Flax has been produced successfully, but the cultivation has not been extended. Hops have been grown experimentally, for the Murree brewery, on neighbouring hills; the cultivation in Kashmir has been more encouraging. Potatoes are grown extensively on cleared areas on the hills. The Punjab produces freely many of the Indian fruits, but none of special excellence except the peaches of Peshawar. Grapes are grown in many of the Himálayan valleys, where the rain is not excessive, also at Peshawar; but they are inferior to those brought from Cabul.

The forest area of the Punjab consists of 4694 square miles reserved, under the management of the forest department, and 13,000 square miles under the district officers. The demarcation of protected and reserved forests is being extended. The wasteful destruction of trees is checked in the hill forests rented from native states by the British Government. The principal reserved forests are the deodár (*Cedrus Deodara*) and chil (*Pinus longifolia*) tracts in the hills, the plantations of shisham (*Dalbergia Sisso*) and sál (*Shorea robusta*) in the plains, and the fuel rakhs or preserves (*Acacia*, *Prosopis*, &c.). The average nett surplus of forest income for the ten years 1875-85 was Rs.161,800.

The rainfall in the Punjab varies greatly in different parts and from year to year. The maximum (126.55 inches in the year) is at Dharmasala, on the face of the high north wall of the Kángra valley; the minimum (5.96) is in the Muzaffargarh district. In a country so open and so far from the sea there are extremes of heat and cold. A temperature of 128° Fahr. in the shade has been recorded, and a winter temperature of 25° at sunrise is not infrequent. At Lahore, on the grass, the thermometer has been known to fall to 17°.

Of the whole area of British Punjab (106,632 square miles) 36,755 square miles are cultivated and 64,263 uncultivated, the remaining 5614 being reckoned uncultivable. An area of 75,434 square miles (48,377,760 acres) is held by 33,020 village communities, formed of small proprietors having joint interests and joint responsibility for the land revenue, but cultivating each his own land. Among the Patháns of the trans-Indus districts the tribe and not the village community is in some cases the jointly responsible body. There are 3406 estates of larger proprietors, with a total area of 4,531,415 acres; and there are 10,216,872 acres of waste land, the property of the Government, of which less than one-half is capable of cultivation. The total area under wheat is seven millions of acres. There is an increasing export of wheat, gram, rice, and oil-seeds.

Irrigation for large areas is from canals and from reservoirs, and for smaller areas from wells. The canals are of two kinds, those carrying a permanent stream throughout the year, and those which fill only on the periodical rising of the rivers, the latter commonly known as "inundation canals." There are only a few parts of the country presenting facilities for forming reservoirs, by closing the narrow outlets of small valleys and storing the accumulated rainfall. The old canals made by the Mohammedan rulers, of which the principal are Firóz's Canal from the Jumna and the Hasli Canal from the Rávi, have been improved or reconstructed by the British Government. The principal new canals are the Sirhind, drawn from the Sutlej near Rúpar, and irrigating parts of the native states of Patiala and Nabha as well as British territory; the Bári Doáb Canal from the Rávi; the Swát Canal, drawn from the Swát river at Abazai; and inundation canals in the districts of Firózpur, Sháhpur, Múltán, and the Déraját, from the Sutlej, the Jhelum, the Chináb, and the Indus. Water was admitted into the Sirhind Canal on 1st July 1882. Its branches are still under construction.

Popula- The population of the British province in 1881 numbered
tion. 18,850,437, of the feudatory states 3,861,683; total, 22,712,120.
This total number consists of:—

	British Territory.	Native States.	Total.
Mohammedans	10,525,150	1,187,284	11,662,434
Hindus	7,130,528	2,121,787	9,252,295
Sikhs	1,121,004	595,110	1,716,114
Jains	35,826	6,852	42,678
Christians	33,420	279	33,699
Buddhists	2,864	387	3,251
Parsis	462	3	465
Others	1,183	1	1,184
	18,850,437	3,861,683	22,712,120
The Christians are thus distrib- uted:—			
European, British subjects	10,761	159	10,920
Other European and American	17,015	8	17,023
European	1,821	23	1,844
Native	3,823	89	3,912
	33,420	279	33,699

The Punjab has one-fourth of the Mohammedan inhabitants of India, one-twentieth of the Hindus, and eleven-twelfths of the Sikhs. Of the Hindus the classes most largely represented are Jāts (4,432,720) and Rājputs (1,677,569). There are in the Punjab certain criminal tribes, always under surveillance, of which the population is at present 13,957.

The tribes of the western hill frontier are Mohammedans and Pathāns in the north and Baluchis in the south (with one Pathān tribe among them). There are sixteen principal Pathān tribes, of which the most important are the Momand, Afridi, and Orakzai on the Peshawar border, and the Waziri adjoining Bannu and the Dera Jāt; and seven Baluch tribes on the Dera Ghāzi Khān border, the chief of which are the Bōzdār, Marri, and Bugti.

Adminis- The British province is divided for administrative purposes into
trative thirty-one districts, each under a deputy commissioner, grouped in
divisions. six divisions, each under a commissioner.

Native
states.

The native states in feudal subordination to the British Government and in connexion with the Punjab are thirty-six in number, thirty-one Hindu and five Mohammedan. Of these many are very insignificant, the rulers being petty Rājput chiefs of old family and small means. The highest chief in rank and importance is the mahārājā of Kashmir and Jammu, a Dōgra Rājput (see vol. xiv. p. 12). The next is the mahārājā of PATIALA (*q.v.*). The Mohammedan state of Bahawalpur on the Sutlej is next, with a population under half a million and a revenue of about 20 lakhs. Next in order are the rājās of Jind and NABHA (*q.v.*), cis-Sutlej states. They are Jāts, like the mahārājā of Patiala, of the Phulkian clan (named from Phul, the founder of these three houses, in the middle of last century). Next comes the rājā of KAPURTHALA (*q.v.*) in the fertile Jalandar Doab, of the Ahluwalia family. Of the rest the most important in point of revenue are the states of Mandi in the hill country west of the Sutlej, and Sarmūr in the hills east of that river, under Rājput rulers, and Faridkōt and Maler Kotla in the plains, cis-Sutlej, the former Hindu, the latter Mohammedan.

Lang-
guages.

Of the 22,700,000 people in the Punjab, in British territory and the native states, about 14,000,000 speak the provincial language, Panjābi, which varies in character in different parts of the province. About 4,250,000 speak HINDUSTANI (*q.v.*), this number including those whose ordinary vernacular is Hindi, but who

understand and are gradually adopting the more comprehensive Hindustani. These two languages are the most generally used throughout the province, but not equally in all parts. The other languages in use are more or less local. Jātiki, spoken by about 1,500,000, belongs chiefly to the south-east districts. The language of the eastern hill country is a form of Hindi, spoken by about 1,500,000. Dōgri is the language of the northern hills, and Kashmiri of a few large bodies of Kashmir workpeople at Ludiana, Nūrpūr, Amritsar, and some other places. The language of the Pathāns of the northern part of the trans-Indus frontier is Pushtu (see vol. i. p. 238). Baluchi is spoken on the same frontier, farther south, adjacent to Baluchistan, Sindī at the extreme south, next to Sind, and Bāgrī, a variety of Hindi, in the cis-Sutlej district bordering on Bikanir. There are also some minor local dialects, and a few people speaking languages not of the Punjab,—Persian, Bengali, Mahrathi, Turki, Tibetan, Nepalese. Hindustani is the language of the law courts and of all ordinary official and other communications with chiefs and people.

Many books, periodicals, and newspapers are published in some of these spoken languages, the greatest number in Hindustani, others in Hindi, Panjābi, Pushtu, and Persian, also some in Sanskrit and classical Arabic, which are not spoken. During the last quarter of which the details are published 360 books were registered, 161 Hindustani, 135 Hindi, 36 English, 16 Arabic, the rest bilingual. There are 7 English and 23 vernacular periodicals, monthly and fortnightly, and 28 vernacular newspapers are published in the British province and 3 in native states.

The number of children under instruction in schools in the Punjab is 184,000 (9000 girls). There are 1559 primary schools for boys, 206 middle schools, 25 high schools, and 3 industrial schools, also a training college and 4 normal schools. For girls there are 321 primary schools, 4 middle, 1 high, 1 industrial, and 4 normal schools. The higher and special educational institutions are the Lahore Government College, the Cambridge University Mission College at Delhi, the Oriental College of the Punjab University, the Medical School, and the Mayo School of Art, the last three at Lahore. A ward's school, for the orphans of Sikh chiefs, established at Ambala in 1867, is about to be extended to receive other upper-class students. The Government department of public instruction was established in 1856. In 1868 the first proposal of a university for the Punjab was made, chiefly at the instance of the literary society called the Anjuman-i-Punjab, with the support of the native chiefs. The institution took the form in 1870 of the Punjab University College, and it was raised in November 1882 to the status of a university. There are several other literary societies in the Punjab besides the Anjuman at Lahore.

The police force numbers 19,827 men, with 580 officers, 68 of whom are Europeans. There is in addition a special frontier police.

The military force in occupation of the Punjab consists of (1) Army. British troops (of which it has a larger proportion than any other province); (2) native troops of the regular Indian army; (3) the Punjab frontier force, a local body of cavalry, infantry, and artillery, ordinarily employed only on the military duties of the western frontier; and (4) the frontier militia, composed of men of the border tribes, both within and without British territory, employed as auxiliary to the regular troops, to garrison certain of the smaller fortified posts along the frontier. There is also a volunteer rifle corps of Europeans at the large stations and on the lines of railway. The total military force, including police, of the native states in connexion with the Punjab is 21,500.

Most of the native manufactures of the Punjab are those common Manu- to other parts of India, such as the ordinary cotton fabrics, plain factures. woollen blankets, unglazed pottery, ropes and cord, grass matting, paper, leather-work, brass vessels, simple agricultural implements, and the tools used in trades.² Other manufactures, not so general, yet not peculiar to the Punjab, are woollen fabrics, carpets and shawls, silk cloths and embroidery, jewellery and ornamental metal-work, wood and ivory carving, turned and lacquered wood-work, glazed pottery, arms and armour, and musical instruments. But some of these classes of manufacture are represented by work of special kinds or special excellence in particular parts of the Punjab, notably the silk fabrics of Multān and of Bahawalpur, the capital of the native state; the carpets of Lahore, Peshawar, &c.; the "kāshi" (see KASHI) or glazed tile-work (an ancient art still practised in a few places); "kōft-kāri," inlaid metal-work (gold wire on steel), chiefly made at Gujrat and Sialkōt; shawls and other fine woollen fabrics, made by Kashmiri workpeople at Ludiana and Nūrpūr, as well as in Kashmir; "lungis," waist and turban scarfs, made at Peshawar, Bannu, &c.; silk embroidery for shawls, scarfs, and turbans, at Delhi, Lahore, and Multān; embroidery on cloth for elephant-trappings, bed and table covers, &c., at Lahore and Multān; enamelled ornaments, in Kangra and Multān; quill embroidery on leather, in Kangra and Simla; lacquered wood-

¹ The figures for the Hissar and Firozpur districts are only approximate, but the sum of the two together is correct. In the redistribution which is now (1885) being carried out the former district of Sirsa has been abolished; the eastern part is added to Hissar and the western to Firozpur. In the above statement half of the area and population has been assigned to each.

² The India Museum at South Kensington has an excellent series of representations of native artisans and their mode of working, from the pencil of the present director of the Lahore School of Art, Mr J. L. Kipling, formerly of the School of Art at Bombay.

work, Pák Pattan. At Kohat there is a special manufactory of gun-barrels made of twisted iron straps. There is much excellent carved wood-work on houses and on boats. Among the Punjab arts should be mentioned the artificial nose-making practised by a special class of surgeons at Kángra. Injury has been done to some of the native arts of the Punjab, as of other parts of India, by unwise copying of European patterns. The Lahore School of Art is expected to correct this and promote the study and execution of native forms and designs. The Lahore Museum contains illustrations of the arts and manufactures, as well as raw products, of the Punjab, and a large collection of the sculptures, mostly Buddhist, and many of Greek workmanship, found in the north-west of the province, chiefly trans-Indus. Upwards of 200 Greco-Buddhist sculptures were excavated in Yusufzai in 1883 and 1884. The number of visitors to the Lahore Museum during the year 1884 was upwards of 251,000. The value of the imports into the Punjab during the same year was £981,167, and of the exports £1,083,919. The chief lines of export and import traffic, apart from the trade with the immediately adjoining countries, are on the one side the railway to Delhi and the North-West Provinces, and on the other the Indus River and Indus Valley Railway to Sind and the sea. The Punjab exports wheat, tea, rock-salt, sugar, and other products, and articles of local manufacture. English piece-goods, cutlery and other metal-work, fruits (especially from Afghanistan and Kashmir), rice, drugs, and spices are among the chief imports. The most important trade-centres are Delhi, Peshawar, Múltán, and Amritsar. There is a large amount of both export and import trade with the countries on the north-west frontier. Efforts were made for some time by the Government to promote trade between the Punjab and Kashgar, but without much result. The endeavour is now being carried on by private enterprise. There are great difficulties in the hill country between, where the goods have to be carried on mules and ponies.

Finance. The revenue of the British province is £3,232,349. Of this sum £1,605,243 (consisting of land revenue £1,220,880, and minor items £384,363) goes to the imperial treasury; £1,410,379 is provincial, raised and expended in the province in addition to an imperial grant; and £216,727 is derived from local rates and miscellaneous income, and is locally expended.

Communication. The total length of railways in the province now (1885) open for traffic is 1205 miles. The main central line from Delhi to Peshawar is 645 miles in length, of which 125 are east of the Jumna in the North-West Provinces, and 520 in the Punjab. Other lines now open are—Lahore to Múltán 208 miles, and 10 to Shír-Sháh, the port of Múltán on the Chináb, Múltán to Baháwalpur 63, Delhi to Riwari 52, Riwari to Hissár 89, Hissár to Firózpur 130, Amritsar to Pathankót 67, Wazirábád to Sialkót 27, Lála Músa (near Gujráat) to Pind Dádan Khán and the Salt Mines 62, Ráwal Pindí to Khushhálgarh 77. Other lines are under construction. There are 1467 miles of metalled road, 23,156 unmetalled, and 2676 miles of navigable river. In this country of great rivers, crossing lines of road, the value of boat-bridges is very great. During the five years following the construction of the bridge of boats over the Indus at Dera Ismail Khán the annual camel traffic between Afghanistan and the Punjab by the Gumal Pass, through the hills on the west, increased from 50,000 to 80,000, with corresponding increase of the "tírní" or grazing-tax paid by the Povinda camel-drivers. This trade-route and this class of carriers are of some importance. For a long time to come they are not likely to make way for other means of transport by road or railroad, though the trade will grow. The Povinda are a travelling tribe belonging to the Ghilzai country in Afghanistan. They make annual trade journeys into India by this route, which is an easy and good one, capable of being turned to more account. The Sikhs imposed heavy duties on the goods they brought. The remission of these duties by the British Government greatly encouraged the trade, which is now further helped by the boat-bridge across the Indus. There are many passes through the hills between British India and Afghanistan, of which the principal are—the Khyber in the north, close to Peshawar, the nearest way to Cabul; the Bolan in the south, approached from Shikárpur and Jacobábád in Sind, the way to Quetta and Candahar; and between them three others looking towards Ghazni, namely, Gumal Pass, the valley of the united Gumal and Zhob rivers opposite Dera Ismail Khán, and the Kurram and Dawar routes opposite Bannú.

While the amount of railway and other traffic has been steadily increasing with the facilities afforded, the demands on the post-office and telegraph have likewise been growing rapidly. The annual number of letters and post-cards, now about twenty millions, has nearly doubled in ten years. The telegraph has had a fluctuating increase in the number of messages, which during the year 1884 was upwards of 142,000.

History. For the early history of the Punjab from the Aryan immigration to the rise of the Mogul dynasty the reader may consult the article INDIA (vol. xii. p. 779 *sq.*). It deserves, however, to be specially noted here with reference to that period that from the time of Alexander onwards Greek settlers remained in

the Punjab, and that Greek artists gave their services for Buddhist work and introduced features of their own architecture in Indian as well as Grecian buildings. Besides the bases and capitals of large Greek columns at Sháh-deri (Taxila) and elsewhere, numerous sculptures of Greek workmanship have been found at various places. These are single statues (probably portraits), also figures of Buddha, and representations of scenes in his legendary history, and other subjects. They are obtained from ruins of monasteries and other buildings, from mounds, and the remains of villages or monumental topes. Of Buddhist buildings now remaining the most conspicuous as well as distinctive in character are the topes (*stupa*), in shape a plain hemisphere, raised on a platform of two or more stages. One of the largest of these is at Manikyála, 14 miles east of Ráwal Pindí. These Buddhist buildings and sculptures are all probably the work of the two centuries before and the three or four after the beginning of the Christian era. The character of the sculptures is now well known from the specimens in the India Museum, South Kensington, and both originals and casts of others in the Lahore Museum. Unfortunately they have no names or inscriptions, which give so much value to the sculptures of the Bharhut tope.

The several bodies of settlers in the Punjab from the earliest Tribes times have formed groups of families or clans (not identical with and Indian castes, but in many cases joining them), which have generally preserved distinct characteristics and followed certain classes of occupation in particular parts of the country. Some of the existing tribes in the Punjab are believed to be traceable to the early Aryan settlers, as the Bhatti tribe, whose special region is Bhattiana south of the Sutlej, and who have also in the village of Pindí Bhattián a record of their early occupation of a tract of country on the left bank of the Chináb, west of Lahore. The Dógra, another Aryan clan, belong to a tract of the lower hills between the Chináb and the Rávi. Others similarly have their special ancient localities. To the earlier settlers—the dark race (*Dasyá*) whom the Aryans found in the country, and who are commonly spoken of as aborigines—belonged, as is supposed, the old tribe called Takka, whose name is found in Taksha-sila or Taxila. And from the later foreigners again, the Indo-Scythians, are probably descended the great Ját tribe of cultivators, also the Gújars, a pastoral people and traders, and others. Some of the tribes or sections of them, having received the Hindu faith and the system of caste, have afterwards given large bodies of converts to Mohammedanism, so that there are now Hindus and Mohammedans of the same tribe continuing to bear the same name. There are Mohammedan Rájputs, and there are both Hindu and Mohammedan Játs, and so with others.

It was during the events which brought Bábar, the first of the Sikh Mogul dynasty, to the throne that the sect of the Sikhs arose. Nának, the founder, derived his first ideas of the movement he was to lead from Kabir of Banáras, a Mohammedan by birth (it is believed), who joined himself to a sect of Hindus and strove to give to their religion a new form and spirit free from idolatry. And the Sikh religion of the Punjab, founded on this model, was a reformed and monotheistic Hinduism. Nának was born in 1469 at Talwandi on the Rávi, and lived to the age of seventy, leaving a large number of followers at his death. The name Sikh means "disciple," and the strength of the movement lay in the relation of the disciple to the "guru" or spiritual guide. In the time of Bábar's successor, Humáyún (who was only in the Punjab during the temporary success of his rival, Shír Khán Súri), the Sikhs were under the direction of the second of their gurus, Angad (1539-1552), and of the third, Amar Dás (1552-1574). During the long reign of Akbar (1556-1605) the Sikhs increased in number and power under the mild and liberal rule of a Mohammedan emperor who was more than tolerant in all matters of religion. He himself sought diligently for knowledge of other faiths, and Amar Dás, the Sikh guru, was one of those who had conferences with him. Ram Dás, son-in-law of Amar Dás, succeeded him in 1574. He received from Akbar a gift of a piece of land, on which he dug the large square tank afterwards called Amritsar ("the pool of immortality"). In the last year of this guru's life the Punjab was visited, on Akbar's invitation, by several Jesuit fathers from Goa, who were received with great favour. To them the emperor gave a site for a church in the city of Lahore, and the church was built at his expense. In 1581 Ram Dás was succeeded by his son Arjun Mal, a man of note. In the middle of his father's tank at Amritsar he built the temple, which was called at first Hari Mandar, and afterwards Darbar Sahib, the name by which it is now known. The town which began to rise round the tank and temple was made the headquarters of the Sikhs. Arjun gave further coherence to the body of his followers by levying a regular tax in place of the fixed and varied offerings they used to give; and he was the compiler of the sacred book called the *Adi Granth*, the materials for which he had received unarranged from his father. Akbar lived much in the Punjab. In 1586 he directed a campaign against the Afghans of the Peshawar valley, which was attended with no important results except the death of his able minister Bir Bal. In the next year he conquered Kashmir. On his visit to this new acquisition he was

accompanied by one of the Portuguese Jesuits, Jerome Xavier (nephew of the celebrated Francis), who was a special friend of the emperor and was with him at the time of his death at Agra in 1605. Arjun's power and prosperity lasted only during Akbar's lifetime. Jahangir was equally favourable to the Christian missionaries; but the Sikh gurú incurred his displeasure. Believed to be a partisan of the emperor's rebellious son Khusrú, Arjun was imprisoned in 1606 and died soon after. His successor, Har Govind, was only twelve years of age at the time of Arjun's death, and as he grew up his relation to the Sikhs became that of commander more than gurú. The promulgation of the *Granth* for instruction of the people had made a way for this change in the character of the leadership. The work of the teacher was now in great measure transferred to the guardians of the sacred volume, who read it in the ears of the people. The gurú thenceforth was the organizing head more than the religious guide. As a young man Har Govind accompanied the emperor to Kashmir. Jahangir, on his way back from this favourite summer resort, died at Rájauri in 1627, and was buried at Sháh-dera on the Rávi, opposite Lahore. His widow, Núr Jahán, erected a beautiful monument over him, and was herself buried at the same place.

The reign of Sháh Jahán (1627-1658) added much to the prosperity of the Punjab. The emperor's large views found a fitting agent in Ali Mardán Khán, his minister and director of works. Under his orders the canal from the Rávi near the foot of the hills to Lahore was made, and the Jumna Canal, which had been constructed in the 14th century by Firóz Sháh, was restored and improved. Ali Mardán Khán also built the magnificent "saráis" or rest-houses for travellers on the high road to Kashmir, and other works of utility in the Punjab. In the contests between the two sons of Sháh Jahán the Punjab favoured the elder, Dara Shikó, whose intelligent interest in the welfare of the country, joined to literary tastes and liberal views, commended him to all classes of the people. His name is preserved in the town of Shikó-púra, 18 miles west of Lahore, Dara-nagar, and other places. The present military station of Lahore bears the name of Dara's religious instructor, Mián Mír, near whose tomb, erected by his royal pupil, the British cantonment is built.

Har Govind, the sixth Sikh gurú, died in 1645. Har Rái, who succeeded him, gave his support to Dara Shikó. Dara was not successful in maintaining his rights against his younger brother Alamgir (called Aurangzib), who succeeded his father in 1658. Bernier, who was visiting India at this time, was a companion of the elder brother when in misfortune and of the younger when in power. Like his three predecessors, Aurangzib was fond of visiting Kashmir, and his journey through the Punjab on one of these occasions (1663-64) furnishes one of the most lively pictures of Bernier's Indian experiences. Har Rái died in 1661, and his successor, Har Kishan, a boy, held the nominal leadership of the Sikhs only three years, being followed in 1664 by Tegh Bahádúr, a son of Har Govind. When, on his return to the Punjab from a visit to Bengal, he was thought to be exercising authority inconsistent with loyalty to the emperor, he was put to death by Aurangzib in 1675. This roused the Sikhs to greater zeal in the adoption of a military constitution. The next gurú, Govind Rái, son of Tegh Bahádúr, after passing some years in retirement and study, came forth a vigorous and enthusiastic leader, with high aims. He set himself to the task of organizing the Sikhs of the Punjab, now becoming formidable from their number, their physique, and their warlike propensities. The first adherents of Nának, the founder of the sect, had been mostly Játs and Khattris. Many were men of great stature and powerful frame. As Sikhs they acquired a distinctive appearance by giving up the Hindu practice of shaving the head and face. They were forbidden the use of tobacco; and their discipline in other things prepared them for being indeed "the soldiers they looked." Govind Rái adopted the designation "Singh" (lion), and this became the distinctive addition to the names of all Sikhs. He called the whole body the "khalsa" or free, and he devised a rite of initiation called the "pahal." He compiled a supplement to the *Granth*, containing instruction suited to the altered condition of the Sikh people. After the death of Aurangzib in 1707 he accepted the invitation of Bahádúr Sháh to join him in a campaign against the Mahrattás. At Nadér, on the Godávári, he was murdered in 1708. His principal associate, Banda, led the Sikhs back to the Punjab and turned his arms against the Government. After a long series of fights with the Mogul's troops, during the reigns of Bahádúr Sháh and Farrukh Siyar, Banda was at length taken in 1716 and put to death.

Mohammed Sháh was on the throne of Delhi, much occupied in contests with the Mahrattás, when Nádir Sháh invaded India. Nádir's march through the Punjab in the beginning of 1739 met with no great opposition; but the Sikhs kept up a system of desultory plunder both of the invaders and of the people fleeing from them. Lahore submitted and was spared; and it escaped again, on Nádir's return, after the defeat of Mohammed Sháh at Karnál and the massacre at Delhi, by having a large sum of money ready to meet the expected demand. The Punjab offered no more

effective resistance to the invasion in 1747 of Ahmad Sháh Abdáli, who kept possession of Afghanistan after Nádir's death. He began by claiming the revenues of the parts of the Punjab and Sind which had been ceded to Nádir. On his third invasion (1752) he obtained possession of Lahore and Múltán. The king of Delhi was now also an Ahmad Sháh, and the invader was, for distinction, called in India Ahmad Khán Afghán. His son Timúr, whom he made governor of Lahore, was driven out by the Mahrattás. Ahmad found frequent visits to the Punjab necessary, and only after the total defeat of the Mahrattás at Panipat in 1761 did he retire finally to Cabul.

For a time the Sikhs seemed to have the prospect of holding the Period Punjab for themselves. Their number and power had greatly increased. They had grouped themselves in associations of kindred pence. and neighbourhood called "misls," with distinctive names. Powerful members of certain of these clans, representing the aristocracy of the Sikh families, acquired the chiefship of large tracts of country on both sides of the Sutlej, some of which became nearly independent states. Then there were certain members of the Sikh confederation, not enrolling themselves in any clan nor owning any master, who assumed the rôle of religious enthusiasts and warriors, and the name "Akáli" or immortal. They were the gházis of Sikhism. They dressed in blue and wore a high-pointed turban on which they carried several chakras of different sizes, their own special weapon. The chakr or chakra is a thin knife-edged ring of flat steel, a severe missile in skilled hands, but not much used. The Sikhs south of the Sutlej enlarged their possessions and made marauding excursions across the Jumna and the Ganges even as far as to Rohilkand. The capital was held by three leading Sikh chiefs, when, in 1797 and the following year, Zamán Sháh, grandson of Ahmad, brought an army with the view of recovering the Punjab, but was recalled both times by troubles at home. He secured Lahore without opposition, and on leaving in 1798 he made it over to a young Sikh who had attracted his attention and done him good service. This was Ranjít Singh, son of Maha Singh, Ranjít a Ját Sikh who had risen to considerable power, and who died Singh. in 1792. The young ruler of Lahore was soon to make himself master of the whole Punjab, while heavy misfortune was awaiting Zamán Sháh himself, who was to find shelter in the Punjab. The dethroned and blinded king was met in 1808 at Ráwal Pindí by Mountstuart Elphinstone when returning from his mission to Sháh Shujá at Peshawar. When Ranjít Singh was beginning his career at Lahore the English adventurer George Thomas was trying, with the army he had raised, to carve out a little principality for himself in the Sikh states south of the Sutlej. Ranjít was a man of strong will and immense energy, of no education but of great acuteness in acquiring the knowledge that would be of use to him. He soon began to bring all the separate bodies of Sikhs under his control, and to acquire authority over others besides the Sikhs. When he endeavoured to include the Sikh states south of the Sutlej within his jurisdiction, the heads of these states—chiefs of Sirhind and Malwa, as they were called—sought and obtained in 1808 the protection of the British, whose territories had now extended to their neighbourhood. The English were at this time desirous of alliance with Lahore as well as with Cabul, for protection against supposed French designs on India. A British envoy, Mr Charles Metcalfe, was received by Ranjít at Kasúr in 1809 and the alliance was formed. Ranjít steadily strengthened himself and extended his dominions. In 1809 he obtained possession of Kangra, which the Nepalese were besieging. In 1813 he acquired the fort of Attock on the other side of the Punjab; and the same year he obtained from Sháh Shujá, now in his turn a refugee in Lahore, what he coveted as much as territory, the celebrated Koh-i-núr diamond, which had been carried off by Nádir Sháh from Delhi. In 1818, after some failures in previous years, he captured Múltán. Kashmir, which had successfully opposed him several times, was annexed the following year, and likewise the southern part of the country between the Indus and the hills. The Peshawar valley he succeeded in adding four years later, but he found it best to leave an Afghan governor in charge of that troublesome district. These trans-Indus and other outlying tracts were left very much to themselves, and only received a military visit when revenue was wanted. Peshawar was never really ruled till General Avitabile was sent there in later years. When he was gradually raising his large and powerful army Ranjít received into his service certain French and other officers, who drilled his troops and greatly improved his artillery. He valued these European officers highly, and exerted himself much to retain them. One of them, M. Allard, used to say that, if it was sometimes difficult to get into Ranjít's service, it was more difficult to get out of it. Whilst he relied on these foreigners for military and sometimes also for administrative services, he drew around him a body of native ministers of great ability, of whom the brothers Guláb Singh and Dhían Singh of Jammú were the most influential. (They had another brother, Suchét Singh, less prominent and less at court.) Ranjít maintained friendly relations with the English Government till his death. This was of much importance when, immediately

Years of
disorder.

after his death in 1839, the British were putting Sháh Shujá back on the throne of Cabul. Ranjit was succeeded by his eldest son Kharak Singh. He left two reputed sons, Shír Singh and Dhalp Singh, and two adopted sons, Kashmira Singh and Peshaura Singh, named from expeditions on which Ranjit was engaged at the time they were taken into his family. When Kharak Singh made Cheit Singh his chief minister in place of the Jammú brothers, Dhián Singh killed the new minister. And now for a time the history of the Punjab became a history of intrigues and deeds of violence, and of contests for power which, when gained, could not be kept. Kharak Singh's successor, Nau Nihál Singh, was killed by the fall of a beam from the Roshnai gateway of the Huzuri Bagh at Lahore as he was returning from the deceased king's funeral. Shír Singh succeeded, a man addicted, like Ranjit, to intemperance, and he was soon put out of the way by Ajit Singh Sindhanwala. His son Partab Singh was murdered by Lena Singh Majithia. Ranjit's adopted sons, Peshaura and Kashmira Singh, were also killed. Then came the turn of the ex-minister Dhián Singh, who was slain by the same hand that had put Shír Singh to death, and which now placed the young Dhalp Singh on the throne. Other assassinations accompanied these chief ones. The leading Sindhanwalas were now all murdered, and with the accession of Dhalp Singh the friends of his mother, the ráni, came into power, some of the wise old servants of Ranjit also continuing to hold important offices.

First.
Sikh
war.

Ranjit had left an army of 92,000 infantry, 31,800 cavalry, with 171 garrison guns and 384 field-pieces. It was a force which could not be held in the feeble grasp of his successors. When one after another of those in nominal power had been assassinated and the treasury plundered, the army, unpaid and unmanageable, demanded to be led into British territory, and had their way. They crossed the Sutlej in December 1845. The battles of Mudki, Firóz-shahr, Baddúwál, and Aliwál were followed by the rout of the Sikh army at Sobráon on 10th February 1846, when they were driven back into the Sutlej with heavy loss, and the British army advanced to Lahore. Of the Sikh guns 256 fell into the hands of the British in these actions on the Sutlej. A treaty was made at Lahore on 9th March with the Sikh darbar, the chiefs and ministry who were to hold the government on behalf of the young maharájá, Dhalp Singh. By this treaty the Jalandar Doab and the hill district of Kangra were ceded to the British, also the possessions of the maharájá on the left bank of the Sutlej. In addition the British demanded a money payment of £1,500,000. The services of Guláb Singh, rájá of Jammú, to the Lahore state, in procuring the restoration of friendly relations with the British, were specially recognized. His independent sovereignty in such lands as might be made over to him was granted. The Sikh Government, unable to pay the whole of the money demand, further ceded, as equivalent for £1,000,000, the hill country between the Bías and the Indus, including Kashmir and Hazára. Guláb Singh was prepared to give the amount in place of which Kashmir was to have become British, and by a separate treaty with him, 16th March 1846, this was arranged. The payment was seventy-five lákhs of Nánaksháhi rupees, and Kashmir was added to Guláb Singh's territory. At the urgent request of the darbar a British force was left at Lahore for the protection of the maharájá and the preservation of peace. To restore order and introduce a settled administration a British resident was appointed, who was to guide and control the council of regency, and assistants to the resident were stationed in different parts of the country.

Second
Sikh
war.

Peace was not long preserved. The governor of Múltán, Diwán Mulráj, desired to resign. Two English officers sent by the resident to take over charge of the fort were murdered, 19th April 1848, and their escort went over to the diwán. Another of the assistants to the resident, Lieutenant Herbert Edwardes, then in the Dérájat, west of the Indus, hearing of the attack on the two officers, hastened to their assistance. On hearing of their fate he collected a force with which to attack the Múltán army while the insurrection was yet local. This he did with signal success. But Múltán could not fall before such means as he possessed. The movement spread, the operations widened, and the Sikh and English forces were in the field again. Múltán was taken. The severe battle of Chilianwala on 18th January 1849 left the Sikhs as persistent as after the two terrible days of Firóz-shahr in the previous campaign. And it needed the crushing defeat of Gujrát, 21st February 1849, like Sobráon in 1846, to bring the war to a conclusion, and this time to give the Punjab to England. It was annexed on 2d April 1849.

Under
British
rule.

For the government of the new province, including the Jalandar Doab, previously annexed, and the cis-Sutlej states, a board of administration was appointed consisting of three members. In place of this board a chief commissioner was appointed in 1853, aided by a judicial commissioner and a financial commissioner. British troops, European and native, of the regular army were stationed at the chief cities and other places east of the Indus and at Peshawar. For the rest of the trans-Indus territory there was a special body of native troops called the Punjab frontier force, under the orders of the chief commissioner. During the Mutiny campaign of 1857 the Punjab, under Sir John Lawrence as chief commissioner, was able to send important aid to the force engaged in

the siege of Delhi, while suppressing the disturbances which arose, and meeting the dangers which threatened, within the Punjab itself. In 1858 the Delhi territory, as it was called, west of the Jumna, was transferred from the North-West Provinces to the Punjab. The enlarged province was raised in rank, and on 1st January 1859 the chief commissioner became lieutenant-governor. In place of the judicial commissioner a chief court was constituted in 1866. The number of judges, at first two, was increased to three in 1869. The number is now (1885) three permanent and two temporary. The form and manner of government are for the most part like those of other British provinces in India, except that the employment, as in the earlier days, of military officers as well as civilians in the civil administration is continued to the present time.

Soon after the annexation of the Punjab Christian missions were begun in the new province by the Church Missionary Society and the American Presbyterian Board. In connexion with the English society there are twenty-four ordained English missionaries, four medical and two lay missionaries, and ten native clergy. At Delhi there is a mission of the Society for the Propagation of the Gospel and the Cambridge University Mission. Also a large number of English ladies are engaged in teaching native ladies, who by the customs of the country are obliged to remain at home. The number of native Christians in the Punjab is nearly 4000. In 1879 a new diocese, that of Lahore, was constituted, embracing the provinces of Punjab and Sind.

PUPPETS. See MARIONETTES.

PURCELL, HENRY (1658-1695), English musical composer, was born in 1658 in St Ann's Lane, Old Pye Street, Westminster. His father, Henry Purcell, was a gentleman of the chapel-royal, and in that capacity sang at the coronation of Charles II. After his father's death in 1664 the boy was placed under the guardianship of his uncle, Thomas Purcell, a man of extraordinary probity and kindness. Through the interest of this affectionate guardian, who was himself a gentleman of His Majesty's chapel, Henry was admitted to the chapel-royal as a chorister, and studied first under Captain Henry Cooke, "master of the children," and afterwards under Pelham Humfrey. He is said to have composed well at nine years old; but the earliest work that can be certainly identified as his is an ode for the king's birthday, written in 1670. After Humfrey's early death in 1674 he continued his studies under Dr Blow. In 1676 he was appointed copyist at Westminster Abbey—not organist, as has sometimes been erroneously stated—and in the same year he composed the music to Dryden's *Aurenge-Zebe*, and Shadwell's *Epsom Wells* and *The Libertine*.¹ These were followed in 1677 by the music to Mrs Behn's tragedy, *Abdelazor*, and in 1678 by an overture and masque for Shadwell's new version of Shakespeare's *Timon of Athens*. The excellence of these compositions is proved by the fact that they contain songs and choruses which never fail to please, even at the present day. The masque in *Timon of Athens* is a masterpiece, and the chorus "In these delightful pleasant groves" in *The Libertine* is constantly sung with applause by English choral societies. In 1679 he wrote some songs for Playford's *Choice Ayres, Songs, and Dialogues*, and also an anthem, the name of which is not known, for the chapel-royal. From a letter written by Thomas Purcell, and still extant, we learn that this anthem was composed for the exceptionally fine voice of the Rev. John Gostling, then at Canterbury, but after-

¹ *The Libertine* was suggested by Tirso de Molina's tale, *El Burlador de Sevilla*, afterwards dramatically treated by Molière and chosen by Da Ponte as the foundation of Mozart's *Don Giovanni*.

wards a gentleman of His Majesty's chapel. Purcell wrote several anthems at different times for this extraordinary voice, a *basso profundo*, the compass of which is known to have comprised at least two full octaves, from D below the stave to D above it. The dates of very few of these sacred compositions are known; but one, "They that go down to the sea in ships," though certainly not written until some time after this period, will be best mentioned here. In thankfulness for a providential escape of the king from shipwreck Gostling, who had been of the royal party, put together some verses from the Psalms in the form of an anthem, and requested Purcell to set them to music. The work is a very fine one but very difficult, and contains a passage which traverses the full extent of Gostling's voice, beginning on the upper D and descending two octaves to the lower.

In 1680 Dr Blow, who had been appointed organist of Westminster Abbey in 1669, resigned his office in favour of his pupil; and Purcell, at the age of twenty-two, was placed in one of the most honourable positions an English artist could occupy. He now devoted himself almost entirely to the composition of sacred music, and for six years entirely severed his connexion with the theatre. But during the early part of the year, and in all probability before entering upon the duties of his new office, he had produced two important works for the stage, the music for Lee's *Theodosius* and D'Urfey's *Virtuous Wife*. There is also strong evidence that it was in 1680—not, as has been generally represented, in 1675—that he composed his opera *Dido and Æneas*, a work of far greater significance in the development of art than has generally been supposed, since it forms a very important landmark in the history of English dramatic music. It was written, to a libretto furnished by Nahum Tate, at the request of Josiah Priest, a professor of dancing, who also kept a boarding-school for young gentlewomen, first in Leicester Fields and afterwards at Chelsea. At the time of its production¹ the condition of dramatic music in England was very rudimentary indeed,—so much so that the opera, properly so called, cannot fairly be said to have existed even in embryo, though it had long flourished brilliantly in Italy, and was beginning to take firm root in France. No English composer had as yet soared above the songs and choruses introduced into the masques, the comedies, and the tragedies of the period, for the purpose of enlivening the performance,—music always of a purely incidental character, and always quite unconnected with the progressive action of the piece. Very different was the mixed form of entertainment thus produced from the true musical drama, the invention of which in Italy dated as far back as the closing years of the 16th century. At that period a number of literary and artistic savants—among them Vincenzo Galilei, the father of the astronomer, Jacopo Peri, Giulio Carcini, and the poet Rinuccini—were accustomed to meet in Florence for purposes of discussion at the house of Giovanni Bardi, count of Vernio. Deeply imbued with the principles of the Renaissance, these heated enthusiasts were determined to carry them from the domain of literature into that of music; and their first dream was the revival of the method of recitation practised by the early Greeks in the tragedies of Æschylus and Sophocles. This, however, was, if only for technical reasons, absolutely impossible. The art was lost for ever; but in seeking to resuscitate it they invented something much more precious—dramatic recitative. With this at command the construction of the veritable "dramma per la musica" was no difficult matter; and in fact Peri actually pro-

duced a true opera, *Euridice*, which in 1600 was performed at Florence in honour of the marriage of Maria de' Medici with Henry IV. of France. Purcell, who had never been in Italy, confesses himself, in the preface to his sonatas, "unskilful in the Italian language," and could never by any chance have heard an Italian opera; but he knew very well what Italian music was, and had not neglected to study it deeply. Yet it is doubtful whether all Italy could at that moment have produced a work so full of inborn genius as *Dido and Æneas*.² It is a musical drama in the strictest sense of the term, a genuine opera, in which the action is entirely carried on in recitative, without a word of spoken dialogue from beginning to end; and the music is of the most genial character—a veritable inspiration, overflowing with spontaneous melody, and in every respect immensely in advance of its age. It never found its way to the theatre, though it appears to have been very popular among private circles. It is believed to have been extensively copied, but one song only was printed by Purcell's widow in *Orpheus Britannicus*, and the complete work remained in manuscript until 1840, when it was printed by the Musical Antiquarian Society, under the editorship of Sir George Macfarren. There is a tradition that the part of Anna (erroneously called Belinda), written for an alto voice, was sung by the composer himself. Should this story be verified, it will tell strongly in favour of the opinion that Purcell really did compose *Dido and Æneas* at the age of seventeen, i.e., in 1675; for it is certain that at the coronation of James II. he sang bass.

In 1682 Purcell was appointed organist of the chapel-royal, *vice* Edmund Lowe deceased, an office which he was able to hold conjointly with his appointment at Westminster Abbey. For some years after this his pen was busily employed in the production of sacred music, odes addressed to the king and royal family, and other similar works. In 1685 he wrote two of his finest anthems, "I was glad" and "My heart is inditing," for the coronation of James II. In 1687 he resumed his connexion with the theatre by furnishing the music for Dryden's tragedy *Tyrannic Love*. It is probable that the public were not at this time prepared for works of so advanced a character as *Dido and Æneas*; for, though the young composer's pen was constantly employed in the production of incidental music, overtures, and act tunes for pieces of the period, we find him attempting no more operas based upon the true principles so cordially accepted on the Continent. In this year also Purcell composed a march and quick-step, which became so popular that Lord Wharton adapted the latter to the fatal verses of *Lillibulero*; and in January 1688 he composed his anthem "Blessed are they that fear the Lord," by express command of the king. A few months later he wrote the music for D'Urfey's play, *The Fool's Preferment*. In 1690 he wrote the songs for Dryden's version of Shakespeare's *Tempest*, including "Full fathom five" and "Come unto these yellow sands," and the music for Betterton's *Prophetess* (afterwards called *Dioclesian*); and Dryden's *Amphitryon*; and in 1691 he produced his dramatic masterpiece, *King Arthur*, also written by Dryden, and first published by the Musical Antiquarian Society in 1843.

But Purcell's greatest work is undoubtedly his *Te Deum* and *Jubilate*, written for St Cecilia's Day, 1694, the first English *Te Deum* ever composed with orchestral accompaniments. In this he pressed forward so far in advance of the age that the work was annually performed at St Paul's Cathedral till 1712, after which it was performed alternately with Handel's Utrecht *Te Deum* and *Jubilate* until 1743, when it finally gave place to Handel's

¹ The difficulty in fixing the exact date of its composition arises from a doubt as to whether or not it was performed in Leicester Fields before it was played in the new boarding-school at Chelsea.

² Alessandro Scarlatti was one year younger than Purcell, and produced his first opera, *L'Onestà nell'amore*, in 1680.

Dettingen Te Deum. Purcell did not long survive the production of this great work. He died at his house in Dean's Yard, Westminster, on 21st November 1695, leaving a widow and three children, the former of whom soon afterwards published a number of his works, including the now famous collection called *Orpheus Britannicus*.

Besides the operas we have already mentioned, he wrote *Don Quixote*, *Bonduca*, *The Indian Queen*, *The Fairy Queen*, and others, a vast quantity of sacred music, and numerous odes, cantatas, and other miscellaneous pieces. (W. S. R.)

PURCHAS, SAMUEL (1577-1626), compiler of works on travel and discovery, was born at Thaxted, Essex, in 1577. He was educated at St John's College, Cambridge, where he graduated M.A. in 1600, and some time afterwards B.D., with which degree he was also admitted at Oxford in 1615. In 1604 he was presented by James I. to the vicarage of Eastwood, Essex, and in 1615 was collated to the rectory of St Martin's, Ludgate, London. He was also chaplain to Abbot, archbishop of Canterbury. Some years before his ecclesiastical duties called him to London Purchas had given over the care of his vicarage to his brother, and spent most of his time in the metropolis in the compilation of his geographical works. In 1613 he published *Purchas, his Pilgrimage or Relations of the World, and the Religions observed in all Ages*, which reached a fourth edition, much enlarged, in 1626; in 1619 *Purchas, his Pilgrim or Microcosmus, or the Historie of Man; relating the wonders of his Generation, varieties in his Degeneration, and necessity of his Regeneration*; and in 1625, in four volumes, *Purchas, his Pilgrimes; or Relation of the World in Sea Voyages and Lande Travels, by Englishmen and others*. This last work was intended as a continuation of Hakluyt's *Voyages*, and was partly founded on MSS. left him by Hakluyt. The fourth edition of the *Pilgrimage* is usually catalogued as vol. v. of the *Pilgrimes*, but the two works are quite distinct, and essentially different in character, as is indeed indicated in the names, the difference being thus explained by Purchas himself: in the *Pilgrimage* he makes use of his own matter though borrowed, while in the *Pilgrimes* the authors themselves act their own parts in their own words. He was also the author of the *King's Tower and Triumphal Arch of London*, a sermon on 2 Sam. xxii. 51, published in 1623. He died in September 1626, according to some in a debtor's prison, and although Anthony Wood affirms that he died in his own house there can be no doubt that the publication of his books had involved him in serious money difficulties.

PURGATORY (*Purgatorium*). The Roman Catholic Church has no more than two declarations of supreme authority on the subject of its distinctive doctrine of purgatory. The first is that of the council of Ferrara-Florence, in which it was defined, as regards the truly penitent who have departed this life in the love of God before they have made satisfaction for their sins of commission and omission by fruits meet for repentance, that their souls are cleansed by purgatorial pains after death, and for their relief from these the suffrages of the living—the sacrifice of the mass, prayers, alms, and other offices of piety—are helpful. The second is that of the council of Trent, which runs as follows:—"Since the Catholic Church, instructed by the Holy Spirit from the sacred writings and the ancient tradition of the fathers, hath taught in holy councils, and lastly in this œcumenical council, that there is a purgatory, and that the souls detained there are assisted by the suffrages of the faithful, but especially by the most acceptable sacrifice of the mass, this holy council commands all bishops to have a diligent care that the sound doctrine of purgatory delivered to us by venerable fathers and sacred councils be believed, maintained, taught, and everywhere preached." This decree is to be read in the light

of an earlier canon of the same council, by which it is condemned as heretical to say that after the reception of the grace of justification the guilt of the penitent sinner is so remitted, and the penalty of eternal punishment so annulled, that no penalty of temporal punishment remains to be paid either in this world or in the future in purgatory before the kingdom of heaven can be opened. Thus the essential point of the doctrine is that Christian souls having any sin upon them at the moment of death pass into a state of expiatory suffering, in which they can be helped by the prayers and other good works of living believers. And this is all that modern Catholic theologians regard as being *de fide*. It is hardly necessary to say that the doctrine as popularly held and currently taught is generally much more detailed and explicit. In view of some of these developments, there is on all hands admitted to exist abundant room for the admonition of the council of Trent, when it proceeded to warn the clergy to exclude from popular addresses all the more difficult and subtle questions relating to the subject, and such as do not tend to edification or make for piety. "They must not allow uncertainties or things which have the appearance of falsity to be given forth or handled, and they are to prohibit as scandalous and offensive such things as minister to curiosity or superstition or savour of filthy lucre. Let the bishops see to it that the prayers of the living—to wit, the sacrifices, prayers, alms, and other works of piety which have been wont to be rendered by believers for the departed—are done piously and devoutly, according to the institutions of the church, and that those which are due by the wills of testators or otherwise be not rendered in a perfunctory manner but diligently and punctually, by priests and other ministers of the church who are bound to this service."

Among the details of the doctrine, which have been the subject of much speculation among Catholics, may be specified the questions relating to the locality of purgatory and the nature and duration of its sufferings. On none of these points has anything authoritative been delivered. It is of course conceived of as having some position in space, and as being distinct from heaven, the place of eternal blessedness, on the one hand, and from hell, the place of eternal woe, on the other. But any theory as to its exact latitude and longitude (such, for example, as underlies Dante's description) must be regarded as the effort merely of the individual imagination. As regards the nature of its pains, there has been a constant disposition to interpret with strict literality the expressions of Scripture as to the cleansing efficacy of fire, but the possibility of interpreting them metaphorically has never been wholly lost sight of. With respect to their duration, it must be inferred from the whole praxis of indulgences as at present authorized by the church that the pains of purgatory are measurable by years and days; but here also everything is left vague.

The thesis of all Protestants, as against the Roman Catholic doctrine of purgatory, is that "the souls of believers are at their death made perfect in holiness and do immediately pass into glory." Scripture authority is claimed on both sides, but the argument, which is a somewhat complicated one and depends mainly on the view arrived at as to the Scriptural doctrine of sin and satisfaction, cannot be entered upon here. When the two doctrines are compared in the light of ecclesiastical tradition it will be found that neither fully coincides with the opinions somewhat vaguely held by the early fathers, whose view of the intermediate state between death and the resurrection was largely affected by the pre-Christian doctrine of Hades or Sheol. On the one hand, Irenæus (*Hær.*, v. 31) regards as heretical the opinion that the souls of the departed do immediately pass into glory; he argues that, as Christ tarried for three days "in the lower

parts of the earth," so must the souls of His disciples also go away into the invisible place allotted them by God, and there remain until the resurrection, when, receiving their bodies and rising as their Lord arose, they shall come into heaven and into the presence of God. On the other hand, it is impossible to point out in any writing of the first four centuries any passage which describes the state of any of the faithful departed as one of acute suffering, although Tertullian's belief that martyrs had the exceptional privilege of being taken to "paradise" at once clearly shows that for ordinary Christians the state after death was regarded rather as one of expectancy than of enjoyment. Still less would it be possible to show that the intermediate state was regarded by them as one in which satisfaction was made for sin. Origen's doctrine of *πῦρ καθάρσιον* is intimately connected with his doctrine of *apokatastasis*; in his view the application of purgatorial fire was not to take place until the last judgment, nor was its efficacy to be limited to those who had closed their life on earth as believers in Christ. In a different connexion Augustine, expounding 1 Cor. iii. 15 as referring more immediately to the purification of Christians by means of the trials of the present life, goes on to speak of it as a supposable thing that the process might be continued after death, but without committing himself to the belief ("incredibile non est, et utrum ita sit quæri potest"). Gregory the Great was the first to formulate in express terms the doctrine which afterwards became that of the whole Roman obedience "de quibusdam levibus culpis esse ante iudicium purgatorius ignis credendus est." Such utterances as this were never accepted by the Greek Church, which in its doctrine of the intermediate state still occupies as nearly as possible the standpoint of the ante-Nicene fathers.

PURI or POOREE, a district of British India in the Orissa division of the lieutenant-governorship of Bengal, lying between 19° 28' and 20° 16' N. lat. and 85° 0' and 86° 28' E. long., with an area of 2472 square miles. It is bounded on the N. by the native states of Banki and Athgarh, on the E. and N.E. by Cuttack district, on the S. by the Bay of Bengal, and on the W. by the Ganjam district of the Madras presidency and by the tributary state of Rampur. For the most part the country is flat, the only mountains being a low range which, rising in the west, runs south-east in an irregular line towards the Chilka Lake, and forms a water-parting between the district and the valley of the Mahanadi. The middle and eastern divisions of the district, forming the south-western part of the Mahanadi delta, consist entirely of alluvial plains, watered by a network of channels through which the most southerly branch of that river, the Koyakhai, finds its way into the sea. The principal rivers in Puri are the Bhargavi, the Daya, and the Nun, all of which flow into the Chilka Lake and are navigable by large boats during the rainy season, when the waters come down in tremendous floods, bursting the banks and carrying everything before them. The chief lakes are the Sar and the Chilka, the former, a backwater of the Bhargavi, being 4 miles long by 2 broad. The Chilka Lake is one of the largest in India; its length is 44 miles, and its breadth in some parts 20 miles. It is separated from the sea only by a narrow strip of sand. The lake is saline and everywhere very shallow, its mean depth ranging from 3 to 5 feet. Puri district is rich in historical remains, from the primitive rock-hewn caves of Buddhism—the earliest relics of Indian architecture—to the mediæval sun temple at Kanarak and the world-renowned shrine of Jagannath. The chief roads in the district are the Calcutta and Madras trunk road and the pilgrim road from Cuttack to Puri. The climate of Puri is dry and healthy, and the average rainfall is 55·80 inches.

The census of 1881 returned the population of Puri district at 888,487 (446,609 males and 441,878 females). By religion 873,664 were returned as Hindus, 14,003 as Mohammedans, and 819 as Christians. The only town with a population exceeding 5000 is PURI (*q.v.*). Puri is strictly a rice-growing tract, but pulses, jute, hemp, flax, and oil-seeds are also produced, while among its miscellaneous crops are tobacco, cotton, sugar-cane, and turmeric. The principal manufactures are salt, earthenware, and brass and bell-metal utensils and ornaments. In 1882-83 the total revenue of the district amounted to £79,493, towards which the land-tax contributed £60,255.

Puri first came under British administration in 1803. The only political events in its history since that date have been the rebellion of the maharaja of Khurda in 1804 and the rising of the paiks or peasant militia in 1817-18. Since then the country has been gradually restored to order and tranquillity.

PURI or POOREE, chief town of the above district, and commonly known as Jagannath, is situated on the Orissa coast in 19° 48' N. lat. and 85° 51' E. long. Its chief interest is centred in the sacred shrine of Jagannath, a temple which dates from the 12th century, and which lies at the southern extremity of the town. In 1881 the population of Puri was 22,095 (males 11,769, females 10,326), of whom 21,913 were Mohammedans.

PURIM (פּוּרִים), a feast of the later Jews, celebrated in honour of the deliverance of the nation from the schemes of Haman recorded in the book of Esther. The historical value of this record has been discussed in the article ESTHER, where also mention is made of the now very prevalent opinion that the feast is an adaptation of a Persian festival. The derivation of the name "Purim," as well as the thing, from the Persian *Furdigān* (Pōrdigān, Pōrdiyān) has been raised above the level of a mere guess by Lagarde, who has shown that the readings *φουρμαία* and *φουρδία* in one of the Greek recensions of Esther point with great probability to a form *φουρδαία* (פּוּרְדִּיָּא) instead of Purim, exactly corresponding with the Persian word (*Ges. Abh.*, p. 164; *Armen. Stud.*, § 1339). The feast falls on the 14th and 15th of Adar, and is, in accordance with Esther ix. 22, of a joyous character, but quite secular in tone, with a great deal of hard drinking, the only quasi-religious features being the reading in the synagogue of the book of Esther and the section about Amalek, Exod. xvii. 8 sq. This celebration appears to have made its way among the Jews only gradually; according to Josephus, however, it was generally observed in his day in all parts of the Jewish world. On the other hand, the preparatory fast on the 13th of Adar, which is based on Esther ix. 31, cannot have been observed in Palestine till a later date, for in the *Megillath Ta'anith* (after the death of Trajan), Adar 13, "the day of Nicanor," is still one of the days on which fasting is forbidden.

PURITANS. See ENGLAND, CHURCH OF, vol. viii. p. 376 sq.; INDEPENDENTS, vol. xii. p. 726 sq.; and PRESBYTERIANISM.

PURNIAH, a district of British India in the Bhagalpur division of the lieutenant-governorship of Bengal, occupying an area of 4956 square miles, is situated between 25° 15' and 26° 37' N. lat. and 87° and 88° 33' E. long. On the N. it is bounded by the state of Nepal and the district of Darjiling, on the E. by the Jalpaiguri, Dinajpur, and Maldah districts, on the W. by Bhagalpur, and on the S. by the Ganges, which separates it from the districts of Bhagalpur and the Santal Parganas. Purniah is a level depressed tract of country, but for the most part of a rich loamy soil of alluvial formation; it is traversed by several streams, which flow from the Himalayas lying to the north and afford great advantages of irrigation and water carriage, and is well cultivated; but in the west the soil is thickly covered with sand deposited by the Kusi river, which rises in the Nepal mountains and flows southwards to the Ganges. The country is destitute of anything that can be called forest, but much scrub jungle is found in the

neighbourhood of the more swampy tracts. Among other rivers of the district is the Mahananda, which rises in the mountains of Sikkim and flows through the east of Purniah into Maldah. Wild animals are not so numerous as in the neighbouring districts, but the tiger is found in all parts of Purniah, particularly along the banks and among the sandy islands of the Kusi, and also in the scrub jungle that runs along the north of the district. The climate of Purniah is of an intermediate character; the average rainfall is 67 inches, and the mean temperature is about 76°-8.

The staple product of Purniah is rice, but jute and tobacco are also cultivated to a considerable extent. Its manufactures include indigo, cottons, woollens, and silks, but the chief is that of indigo, which is mostly carried on in the south of the district. In 1882-83 the gross revenue amounted to £179,750, nearly two-thirds (£120,541) being derived from the land. By the census of 1881 the population numbered 1,848,687 (937,080 males, 911,607 females). The majority of the people are Hindus (1,076,539 in 1881); of Mohammedans in the same year there were 771,130, and of Christians only 327. PURNIAH, the capital, is the only town in the district with a population exceeding 10,000.

This district was conquered by the Mohammedans in the 13th century, but it was not until four centuries later that its value was realized. During the 17th century the frontier was considerably extended; the country, however, remained in a state of anarchy until 1770, when it was governed by an English official with the title of "superintendent." Of late years the district has made considerable progress, and under all departments of local administration there has been steady improvement.

PURNIAH, chief town and administrative headquarters of the above district, is situated on the east bank of the river Saura, in 25° 46' N. lat. and 87° 30' E. long. It contains a population, according to the census of 1881, of 15,016. The town is neat and well-built, but very unhealthy; it is distant 283 miles north-west of Calcutta.

PURPLE (*πορφύρα*), the name given by the ancients to a dye derived from various species of *Murex* and *Purpura*. (See MOLLUSCA, vol. xvi. p. 648 sq.; DYEING, vol. vii. p. 571; and PHŒNICIA, vol. xviii. p. 804.) For the modern sources of the various shades of this colour, see DYEING, vol. vii. p. 579.

PURPURA, a disease characterized by the occurrence of purple-coloured spots upon the surface of the body, due to extravasations of blood in the skin, accompanied occasionally with hæmorrhages from mucous membranes. Difference of opinion has prevailed among physicians as to whether these symptoms are to be regarded as constituting a disease *per se*, since they are frequently seen in connexion with various morbid conditions. Thus in persons suffering from such diseases as rheumatism, phthisis, heart disease, cancer, Bright's disease, jaundice, as well as from certain of the infectious fevers, extravasations of the kind above-mentioned are not unfrequently present. But the term "purpura" is, strictly speaking, applicable only to those instances where the symptoms exist apart from any antecedent disease. In such cases the complaint is usually ushered in by lassitude and feverishness. This is soon followed by the appearance on the surface of the body of the characteristic spots in the form of small red points scattered over the skin of the limbs and trunk. They are not raised above the surface, and they do not disappear on pressure. Their colour soon becomes deep purple or nearly black; but after a few days they undergo the changes which are observed in the case of an ordinary bruise, passing to a green and yellow hue and finally disappearing. When of minute size they are termed "petechiæ" or "stigmata," when somewhat larger "vibices," and when in patches of considerable size "ecchymoses." They may come out in fresh crops over a lengthened period.

The form of the disease above described is that known as "purpura simplex." A more serious form of the malady is that to which the term "purpura hæmorrhagica" is applied.

Here, in addition to the phenomena already mentioned as affecting the skin, there is a tendency to the occurrence of hæmorrhage from mucous surfaces, especially from the nose, but also from the mouth, lungs, stomach, bowels, kidneys, &c., sometimes in large and dangerous amount. Great physical prostration is apt to attend this form of the disease, and a fatal result sometimes follows the successive hæmorrhages, or is suddenly precipitated by the occurrence of an extravasation of blood into the brain.

The causes of purpura are not well understood. The condition of the blood has been frequently investigated, but no alteration in its composition detected. The view most commonly held is that the disease depends on an abnormal fragility of the minute blood-vessels owing to their mal-nutrition. It would seem sometimes to arise in persons enjoying perfect health; but in a large proportion of instances it shows itself among those who have been exposed to privation or insanitary conditions, or whose health has become lowered. Young persons suffer more frequently than adults, and repeated attacks may occur. Purpura has some points of resemblance to scurvy, but a clear distinction both as to causation and symptoms can be established between the two diseases.

The treatment will bear reference to any causes which may be discovered as associated with the onset of the disease, such as unfavourable hygienic conditions, and nutritive defects should be rectified by suitable diet. The various preparations of iron seem to be the best medicinal remedies in this ailment, while more direct astringents, such as gallic acid, ergot of rye, turpentine, or acetate of lead, will in addition be called for in severe cases and especially when hæmorrhage occurs.

PURSLANE, the vernacular equivalent of the botanical genus *Portulaca*. The species are fleshy annuals of small dimensions, with prostrate stems and entire leaves; the flowers are small and inconspicuous, or in some species brilliantly coloured, regular, with two sepals, five petals, seven to twenty stamens, an inferior ovary, with a style divided into from three to eight branches and ripening into a pod which opens by a transverse chink. *P. oleracea* is a native of India, which has been introduced into Europe as a salad plant, and in some countries has spread to such an extent as to become a noxious weed. This is the case in certain parts of the United States, where the evil qualities of "pussly" have become proverbial. Like many other succulent plants, its juice is cooling and is used in tropical countries as a refrigerant in fever, while the bruised leaves are employed as an application in cases of local inflammation. Some of the species, such as *P. grandiflora* and its varieties, are grown in gardens on rock-work owing to the great beauty and deep colouring of their flowers, the short duration of individual blossoms being compensated for by the abundance with which they are produced.

PUSEY, EDWARD BOUVERIE (1800-1882), originally Edward Bouverie, was born near Oxford in 1800. His family, which was of Huguenot origin, became through a marriage connexion lords of the manor of Pusey, a small Berkshire village near Oxford, and from it took their name a few years after Edward Bouverie's birth. In 1818 he became a commoner of Christ Church, Oxford, and after gaining high university distinctions was elected in 1824 to a fellowship at Oriel College. He thus became a member of a society which already contained some of the ablest of his contemporaries,—among them J. H. Newman and John Keble. But for several years his intercourse with them seems to have been slight. He divided his time between his country home and Germany, and occupied himself with the study of Oriental languages and of German theology. His first work, published in 1828, was a vindication of the latter from a strong attack which had been

made upon it by one of the leaders of the nascent High-Church party, H. J. Rose. His work, which is entitled *An Historical Enquiry into the probable Causes of the Rational Character lately predominant in the Theology of Germany*, is an impartial and clear summary of the history of German theology since the Reformation. In the same year (1828) the duke of Wellington appointed him to the regius professorship of Hebrew with the attached canonry of Christ Church, which he held for the rest of his life. Mr Rose's somewhat intemperate reply to him led to the publication in 1830 of a second part of his *Historical Enquiry*, which is not less liberal in its tone than the previous part. But in the years which immediately followed the current of his thoughts began to set in another direction. The revolt against individualism had begun, and he was attracted to its standard. By the end of 1833 "he showed a disposition to make common cause" with those who had already begun to issue the *Tracts for the Times*. "He was not, however, fully associated in the movement till 1835 and 1836, when he published his tract on baptism and started the Library of the Fathers" (Cardinal Newman's *Apologia*, p. 136). The real work of his life then began. He became a close student of the fathers and of that school of Anglican divines who had continued, or revived, in the 17th century the main traditions of pre-Reformation teaching. In ten years after his first adhesion to the movement he had become, with his almost boundless capacity for accumulating information, saturated with patristic and "Anglo-Catholic" divinity; and a sermon which he preached before the university in 1843, *The Holy Eucharist a Comfort to the Penitent*, so startled the authorities by the re-statement of doctrines which, though well known to ecclesiastical antiquaries, had faded from the common view, that by the exercise of an authority which, however legitimate, was almost obsolete he was suspended for three years from the function of preaching. The immediate effect of his suspension was the sale of 18,000 copies of the condemned sermon; its permanent effect was to make Pusey for the next quarter of a century the most influential person in the Church of England. The movement, in the origination of which he had had no share, came to bear his name: it was popularly known as Puseyism and its adherents as Puseyites. His activity, both public and private, as leader of the movement was enormous. He was not only on the stage but also behind the scenes of every important controversy, whether theological or academical. In the Gorham controversy of 1850, in the question of Oxford reform in 1854, in the prosecution of some of the writers of *Essays and Reviews*, especially of Professor Jowett, in 1863, in the question as to the reform of the marriage laws from 1849 to the end of his life, in the revived controversy as to the meaning of everlasting punishment in 1877, he was always busy with articles, letters, treatises, and sermons. The occasions on which, in his turn, he preached before his university were all memorable; and some of the sermons were manifestoes which mark distinct stages in the history of the party of which he was the leader. The practice of confession in the Church of England practically dates from his two sermons on *The Entire Absolution of the Penitent*, in 1846, in which the revival of high sacramental doctrine is complemented by the advocacy of a revival of the penitential system which mediæval theologians had appended to it. The sermon on *The Rule of Faith as maintained by the Fathers and by the Church of England*, in 1851, stemmed the current of secessions to Rome after the Gorham judgment, which had seemed to show that on an important point of dogmatic theology the Church of England had no definite doctrine. The sermon on *The Presence of Christ in the Holy Eucharist*,

in 1853, first formulated the doctrine round which almost all the subsequent theology of his followers has revolved, and which has revolutionized the current practices of Anglican worship. And the last university sermon which he composed, and which he was too ill to deliver himself, *Unscience, not Science, adverse to Faith*, in 1878, rendered not only to his party but to religion in general the signal service of abandoning the old quarrel between theology and science, as to the manner in which the world was created, by admitting the possibility of evolution. Of his larger works the most important are his two books on the Eucharist—*The Doctrine of the Real Presence* (consisting of notes on his university sermon of 1853), published in 1855, and *The Real Presence . . . the Doctrine of the English Church*, published in 1857; *Daniel the Prophet*, in which he endeavours with great skill to maintain the traditional date of that book; *The Minor Prophets, with Commentary*, which forms his chief contribution to the study of which he was the professor; and the *Eirenicon*, in which he endeavoured to find, for those who accepted his premises, a basis of union between the Church of England and the Church of Rome. In 1836 he joined Newman, Keble, and Marriott in editing a series of translations from the fathers entitled *A Library of Fathers of the Holy Catholic Church anterior to the Division of East and West*, and contributed to it a revised translation of St Augustine's *Confessions* and several valuable prefaces; the series was accompanied by a translation of the *Catena Aurea* of Thomas Aquinas, and was followed by an edition of some of the texts which had been translated. He also edited, with suitable omissions, several books of devotion by Roman Catholic writers, such as Avillon and Scupoli.

In private life his habits were simple almost to austerity. He had few personal friends, and rarely mingled in general society; though bitter to opponents, he was gentle to those who knew him, and his munificent charities gave him a warm place in the hearts of many to whom he was personally unknown. In his domestic life he had some severe trials: his wife died, after eleven years of married life, in 1839; his only son, who was a scholar like-minded with himself, who had shared many of his literary labours, and who had edited an excellent edition of St Cyril's commentary on the minor prophets, died in 1880, after many years of great bodily affliction. From that time Pusey was seen by only a few persons. His own bodily infirmities increased, and on 16th September 1882, after a short illness, he died a painless death. He was buried at Oxford in the cathedral of which he had been for fifty-four years a canon. His friends devised for him after his death a singular memorial: they purchased his library, and bought for it a house in Oxford which they endowed with sufficient funds to maintain three librarians, who were charged with the duty of endeavouring to perpetuate in the university the memory of the principles which he taught.

His name will be chiefly remembered as the representative of a great religious movement which, whatever may be its ultimate issue, has carried with it no small part of the religious life of England in the latter half of the 19th century. His chief characteristic was an almost unbounded capacity for taking pains. His chief influence was that of a preacher and a spiritual adviser. His *Parish Sermons* reproduce the substance of patristic homilies in the massive style of the Caroline divines. His correspondence as a spiritual adviser was enormous; his deserved reputation for piety and for solidity of character made him the chosen confessor to whom large numbers of men and women unburdened their doubts and their sins. But if he be estimated apart from his position as the head of a great party, it must be considered that he was more a theological antiquary than a theologian. He exhumed many forgotten theories and supported them by a large number of quotations from ancient writers; but the heterogeneous masses of information which he accumulated require a sifting which often leaves but a scanty residuum, and, however valuable to advanced scholars, cannot safely be commended

to learners. Whatever he wrote was relative to the controversies of his time, and as a controversialist he holds a place which is unique among his contemporaries. He had an almost unrivalled power of massing his evidence, of selecting from an author just so much as was pertinent to the point under discussion, and of ignoring or depreciating statements which were at variance with the views which he advocated. As a party leader he combined great enthusiasm with indefatigable energy and tenacity of purpose; he chose his positions beforehand with great skill, and never afterwards abandoned them. But he does not seem to have had any great logical power: he builds elaborate arguments upon words of shifting connotation, such as "faith" and "church," and slides unconsciously from one meaning to another. Nor is there any evidence that he ever faced the historical difficulties which the position of the Church of England presents from the Catholic point of view, and which ultimately led to Newman's secession. He lived in Christian antiquity, and his arguments seldom touched any but sympathetic natures. Unlike Newman, who appealed to the cultured intellect of his time, he never caught the modern spirit. The result was that after Newman's departure the party of which Pusey was the head never made a single convert of mark. The intellect of Oxford and of England drifted away from it; and, in spite of the eloquence of some of its advocates, "Puseyism" does not now number among its adherents any one who exercises an appreciable influence upon the intellectual life of England.

In fact Pusey survived the system which had borne his name. His followers went beyond him, or away from him, in two directions. On the one hand, his revival of the mediæval doctrine of the Real Presence, coinciding as it did with the revival of a taste for mediæval art, naturally led to a revival of the mediæval ceremonial of worship. With this revival of ceremonial Pusey had little sympathy: he at first protested against it (in a university sermon in 1859); and, though he came to defend those who were accused of breaking the law in their practice of it, he did so on the express ground that their practice was alien to his own. But this revival of ceremonial in its various degrees is now the chief external characteristic of the movement of which he was the leader; and "Ritualist" has thrust "Puseyite" aside as the designation of those who hold the doctrines for which he mainly contended. On the other hand, the pivot of his teaching was the appeal to primitive antiquity. It was an appeal which had considerable force as against the rapid theology of the early part of the century, and as a criterion of the claims of Catholicism. But it lost its force, and his followers came to substitute for it an appeal to the principles of an *a priori* philosophy, some of which were borrowed from Thomism and some, though at second hand, from Hegelianism. Nor is it probable that Puseyism will revive again. On the one hand, an appeal to primitive times which is divorced, as was Pusey's appeal, from the history of those times must necessarily fail in an age in which the spirit of historical inquiry is abroad; on the other hand, however excellent the maxim may be which Pusey put in the forefront of his arguments, *Quod semper, quod ubique, quod ab omnibus*, yet, when limited, as Pusey limited it, to the statements of particular writers and the current beliefs of particular ages, it becomes a mere paradox and ceases to afford a logical basis for any system of doctrine. (E. HA.)

PUSHKIN. See **POUSHKIN**.

PUSHTU. See **AFGHANISTAN**, vol. 1. p. 238.

PUSTULE, MALIGNANT, a contagious disease communicated to man from certain animals (especially cattle, sheep, and horses) suffering from splenic fever. This malady will be referred to under **WOOLSORTER'S DISEASE**, of which it forms a variety.

PUTEOLI. See **POZZUOLI**.

PUTNEY, a suburb of London in the county of Surrey, is situated on the right bank of the Thames, about 8 miles above London Bridge by the river and $4\frac{1}{2}$ miles west of Hyde Park Corner by road. The picturesque old timber bridge connecting it with Fulham on the left bank of the river, and erected in 1729, is superseded by a structure of iron and granite. Putney is the headquarters of London rowing and the starting-point for most important boat-races. It consists chiefly of the old-fashioned High Street leading to Putney Common, and various streets of villas and houses inhabited by the middle classes. The church of St Mary near the bridge was rebuilt in 1836, with the exception of the picturesque old tower. Among the benevolent institutions are the almshouses of the Holy Trinity, founded by Sir Abraham Dawes in the reign of Charles II.; the waterman's school, founded in 1684, for

the education of watermen's sons; and the royal hospital for incurables. To the south-west of the town is Putney Heath, 400 acres in extent, formerly a great resort of highwaymen and duellists. Putney is included within the metropolitan area. The population of the registration sub-district (area, 2235 acres) in 1871 was 9439, and in 1881 it was 13,235.

Putney occurs in Domesday as "Putelei," and subsequently appears as "Puttenheth" and "Pottenheth," gradually contracted into "Putney." The ferry was in early times of considerable importance. During the Parliamentary wars the heath was frequently occupied by troops, the headquarters of the generals being in the village. Putney was the birthplace of Thomas Cromwell, earl of Essex, and of Gibbon the historian.

PUTREFACTION. See **FERMENTATION**, vol. ix. pp. 97, 98.

PUTTY is a kind of cement composed of fine powdered chalk intimately mixed with linseed oil, either boiled or raw, to the consistency of a tough dough. It is principally used by glaziers for bedding and fixing sheets of glass in windows and other frames, by joiners and painters for filling up nail-holes and other inequalities in the surface of wood-work, and by masons for bedding ashlar-work. The oxidation of the oil gradually hardens putty into a very dense adherent mass. When putty is required to dry quickly, boiled oil and sometimes litharge and other driers are used. "Putty powder" or "polisher's putty" is oxide of tin in a state of fine division used for the polishing of glass, hard metals, granite, and similar substances.

PUY, **LE**, or more precisely **LE PUY EN VELAY**, chief town of the department of Haute-Loire, France, 352 miles from Paris by rail and 270 in a direct line, rises in the form of an amphitheatre at a height of 2050 feet above sea-level upon Mont Anis, the hill that divides the left bank of the Dolézon from the right bank of the Borne (a rapid stream which joins the Loire 3 miles below). From the new town, which lies east and west in the valley of the Dolézon, the traveller ascends the old feudal and ecclesiastical town through narrow steep streets, paved with slippery pebbles of lava, to the cathedral commanded by the fantastic pinnacle of Mont Corneille. Mont Corneille, which is 433 feet above the Place de Breuil (in the lower town), is a steep rock of volcanic breccia, surmounted by a colossal iron statue of the Virgin (53 feet high, standing on a pedestal 23 feet high), cast after a model by Bonassieux out of 213 guns taken at Sebastopol. The monument is composed of eighty parts fitted together and weighs 98½ tons. Another statue, that of a bishop of Puy, also sculptured by Bonassieux, faces that of the Virgin. From the platform of Mont Corneille a magnificent panoramic view is obtained of the town, and of the volcanic mountains, which make this region one of the most interesting parts of France. The Romanesque cathedral (Notre Dame), dating from the 6th to the 12th century, has a particoloured façade of white sandstone and black volcanic breccia, which is reached by a flight of sixty steps, and consists of three tiers, the lowest composed of three high arcades opening into the porch beneath the nave of the church; above are three windows lighting the nave: and these in turn are surmounted by three gables, two of which, those to the right and the left, are of open work. Two side porches lead to the cathedral by the transept. The bell-tower (184 feet), which rises behind the choir in seven stories, is one of the most beautiful examples of the Romanesque transition period. The bays of the nave are covered in by octagonal cupolas; the central cupola forms a lantern. The choir and transepts are barrel-vaulted. The cathedral has mural paintings of the 12th and 13th centuries, an open-work Romanesque screen surrounding the sanctuary, and a manuscript Bible belonging to the 9th century. The cloister, to the north of the choir, is striking.

owing to its variously-coloured materials and elegant shafts: Viollet le Duc considers one of its galleries to belong to the oldest known type of cathedral cloister (8th and 9th centuries). Connected with the cloister are remains of fortifications of the 13th century, by which it was separated from the rest of the city. Near the cathedral the baptistery of St John (4th century), built on the foundations of a Roman building, is surrounded by walls and numerous remains of the period, partly uncovered by recent excavations. The church of St Lawrence (14th century) contains the remains of Du Guesclin. Le Puy possesses fragmentary remains of its old line of fortifications, among them a machicolated tower, which has been restored, and a few curious old houses dating from the 12th to the 17th century. Of the modern monuments the statue of La Fayette and a fountain in the Place de Breuil, executed in marble, bronze, and syenite, may be specially mentioned. The museum, named after Crozatier, a native metal-worker to whose munificence it principally owes its existence, contains antiquities, engravings, a collection of lace, and ethnographical and natural history collections. Among the curiosities of Puy should be noted the church of St Michel d'Aiguille, beside the gate of the town, perched on an isolated rock like Mont Corneille, the top of which is reached by a staircase of 271 steps. The church dates from the end of the 10th century and its chancel is still older. The steeple is of the same type as that of the cathedral. Three miles from Puy are the ruins of the Château de Polignac, one of the most important feudal strongholds of France. The population of Puy in 1881 was 18,567. The trade is chiefly in cattle, woollens, grains, and vegetables. The principal manufacture is that of laces and blöndes (in woollen, linen, cotton, silk, gold, and silver threads), which is carried on by 130,000 workwomen in the neighbourhood, the yearly turnover being £1,000,000. The town is connected by rail with St Étienne and Lyons, and also with Brioude on the line from Clermont-Ferrand to Nîmes.

It is not known whether Le Puy existed previously to the Roman invasion. Towards the end of the 4th or beginning of the 5th century it became the capital of the country of the Vellavi, at which period the bishopric, originally at Revesion, now St Paulien, was transferred hither. Gregory of Tours speaks of it by the name of Anicium, because a chapel "ad Deum" had been built on the mountain, whence the name of Mont Adidon or Ani, which it still retains. In the 10th century it was called Podium Sanctæ Mariæ, whence Le Puy. In the Middle Ages there was a double enclosure, one for the cloister, the other for the town. The sanctuary of Notre Dame was much frequented by pilgrims, and the city grew famous and populous. Rivalries between the bishops (who held directly of the see of Rome) and the lords of Polignac, revolts of the town against the royal authority, and the encroachments of the feudal superiors on municipal prerogatives often disturbed the quiet of the town. The Saracens in the 8th century, the Routiers in the 12th, the English in the 14th, the Burgundians in the 15th, successively ravaged the neighbourhood. Le Puy sent the flower of its chivalry to the crusades in 1096, and Raymond d'Aiguille, called d'Agiles, one of its sons, was their historian. Many councils and various assemblies of the states of Languedoc met within its walls; popes and sovereigns, among the latter Charlemagne and Francis I., visited its sanctuary. Pestilence and the religious wars put an end to its prosperity. Long occupied by the Leaguers, it did not submit to Henry IV. until many years after his accession.

PUY DE DÔME, a department of central France, four-fifths of which belonged to Basse-Auvergne, one-sixth to Bourbonnais, and the remainder to Forez (Lyonnais), lies between 45° 17' and 46° 16' N. lat. and 2° 23' and 4° E. long. It is bounded on the N. by Allier, on the E. by Loire, on the S. by Haute-Loire and Cantal, and on the W. by Corrèze and Creuse. The chief town, Clermont-Ferrand, is 217 miles south of Paris in a direct line; and the department takes its name from a volcanic cone (4800 feet) which overlooks it. A meteorological observatory has stood on the summit, on the site of an old Roman temple, since 1876. The highest point of the department,

the Puy de Sancy (6188 feet), is also the most elevated peak of central France; it commands the group of the volcanic Monts Dore, so remarkable for their rocky corries, their erosion valleys, their trap dykes and *orgues* of basalt, their lakes sleeping in the depths of ancient craters or confined in the valleys by streams of lava, and their wide plains of pasture-land. The Puy de Sancy, forming part of the watershed, gives rise on its northern slope to the Dordogne, and on the east to the Couze, a sub-tributary of the Loire, through the Allier. The Monts Dore are joined to the mountains of Cantal by the non-volcanic group of the Céallier, of which the highest peak, the Luguet (5101 feet), rises on the confines of Puy de Dôme and Cantal. On the north the Monts Dore are continued by a plateau of the mean height of from 3000 to 3500 feet, upon which are seen sixty cones raised by volcanic outbursts in former times. These are the Monts Dôme, which extend from south to north as far as Riom, the most remarkable being the Puy de Dôme and the Puy de Pariou, the latter having a crater more than 300 feet in depth. To the east of the department, along the confines of Loire, are the Monts du Forez, rising to 5380 feet and still in part crowned with forests. Between these mountains and the Domes extends the fertile plain of Limagne. The drainage of Puy de Dôme is divided between the Loire, by its affluents the Allier and the Cher, and the Gironde, by the Dordogne. The Allier traverses the department from south to north, receiving on its right the Dore, which falls into the Allier at the northern boundary and lowest level of the department (879 feet); on its left are the Alagnon from the Cantal, the two Couzes from the Luguet and the Monts Dore, and the Sioule, the most important of all, which drains the north-west slopes of the Monts Dore and Dôme, and joins the Allier beyond the limits of the department. The Cher forms for a short space the boundary between the departments of Puy de Dôme and Creuse, close to that of Allier. The Dordogne, while still scarcely formed, flows past Mont-Dore-les-Bains and La Bourboule and is lost in a deep valley which divides this department from that of Corrèze. None of these streams are navigable, but boats can be used on the Allier during floods. The climate of Puy de Dôme is usually very severe, owing to its high level, and its distance from the sea; the mildest air is found in the northern valleys, where the elevation is least. During summer the hills about Clermont-Ferrand, exposed to the sun, become all the hotter because their black volcanic soil absorbs its rays. On the mountains from 24 to 36 inches of rain fall in the year, but only half this amount (18 inches) in Limagne, around which the mountains arrest the clouds. Nevertheless the soil of this plain, consisting of alluvial deposits of volcanic origin, and watered by torrents and streams from the mountains, makes it one of the richest regions of France.

Of a total area of 1,964,685 acres 925,146 are arable, 266,226 meadow and grass land, 232,210 under wood, 78,006 under vines, while 397,663 are moorland or coarse pasturage. Out of a total of 566,064 inhabitants 392,177 are engaged in agriculture. Puy de Dôme possesses 18,500 horses, 1600 mules, 4850 asses, 16,100 oxen or bulls, 174,000 cows or heifers, 60,500 calves, 309,900 sheep, 90,500 pigs, 22,550 goats, and 25,900 beehives, which in 1881 produced 95 tons of honey and 33 tons of wax. In 1882 there were produced 369,313 quarters of wheat, 493,134 of rye, 197,241 of barley, 320,138 of oats, 25,172 of buckwheat, 5,172,408 bushels of potatoes, and in 1881 234,504 bushels of dried vegetables, 1,986,208 bushels of beetroot, 33 tons of tobacco, 1625 tons of hemp, 21 tons of flax, 26,176 bushels of rape-seed, a great quantity of colza oil, and 13,054,052 gallons of wine. The Limagne produces fruits of all kinds—apricots, cherries, pears, apples, and walnuts, and there are also plantations of mulberry trees. The department possesses numerous mineral treasures. The coal-mines, occupying a surface-area of 7660 acres, employ 1881 men, and in 1882 produced 188,234 tons. The most important, at Brassac on the Allier, on the borders of Haute-Loire, employ 1200 or 1500 men (in the two departments). Next come those of St Eloi near the department of Allier, and of

Bourg-Lastic and Messeix on the borders of Corrèze. The department also works peat, asphalt, and bituminous schists. Mines of argentiferous lead employ 640 men and produce 33,695 tons of lead or silver, worth £45,600. The most important mines and foundries are at Pontgibaud on the Sioule. Copper, arsenic, iron, antimony, barium sulphate, alum, manganese, white lead, sulphur, sulphuretted zinc, loadstone, and (of precious stones) amethysts, jacinths, rubies, agates, chalcidones, opals, are also found in the department. Quarries of porphyry and lava are worked (Volvic with 900 men), as well as marl, limestone, and gypsum. The hot springs of Mont Dore, known in the days of the Romans, contain a mixture of arsenic and iron bicarbonates, and are used especially for affections of the respiratory organs. The waters of La Bourboule, containing sodium chlorides and bicarbonates, are particularly rich in arsenic, and efficacious against affections of the lymphatic glands, scrofula, diseases of the skin and air-passages, and rheumatism. The springs of St Nectaire, containing sodium and iron chlorides and bicarbonates, are efficacious in liver complaints, rheumatism, and gravel. Some of them are petrifying, as the spring of St Allire at Clermont-Ferrand. The waters of Royat, in use in the time of the Romans, containing sodium and iron chlorides and bicarbonates, sparkling and rich in lithia, are used in cases of anæmia, rheumatism, gout, diabetes, and gravel. The waters of Châteauneuf (on the Sioule), also known to the Romans, contain iron bicarbonates and are resorted to for skin diseases. Those of Châtelguyon, like the waters of Carlsbad and Marienbad, are used for disorders of the digestive organs, congestions of the liver, rheumatism, &c. The waters of Châteldon are used for the table. There are other chalybeate waters at St Martial, Beaulieu, Pontgibaud, St Myon, St Maurice, Arlanc, and many other mineral springs of varied character. Manufactures are for the most part grouped around Thiers, which produces a large amount of cheap cutlery, pasteboards (especially adapted for stamps or playing-cards), and leather; 20,000 workmen are thus employed, and the annual turn-over amounts to £1,200,000. The department contains important paper-mills, factories for lace and braid (in the mountains), for bunnings, and camlets. Those for wool, cotton, and hemp contain 3500 spindles and more than 400 looms. There are wool-carding works and factories for linens, cloths, and counterpanes,—also silk-mills, tanneries, manufactories for chamois and other leathers, for caoutchouc, important sugar-works, starch-works, manufactures of edible pastes with a reputation as high as those of Italy, and manufactures of fruit-preserved. The saw-mills and the cheese industry in the mountains complete the list, which includes 201 establishments employing 75,553 persons. The department exports grain, fruits, cattle, wines, cheese, wood, and mineral waters. Traffic is carried on over 294 miles of Government roads, 9591 miles of other roads, and 178 miles of railway. The department is crossed from north to south by the railway from Paris to Nîmes, and that of Vichy to Thiers; from west to east by that from Bordeaux to Lyons by Tulle, Clermont-Ferrand, and Thiers, with branches from Eygurande to Lagnac and from Vertaison to Billom. It is skirted on the north-west by the line from Montluçon to Gannat, with a branch line for goods to the mines of St Éloi. Twenty thousand inhabitants of the department, belonging chiefly to the district of Ambert, leave it during winter and find work elsewhere as navies, chimney-sweeps, pit-sawyers, &c. The department in 1881 contained 566,064 inhabitants and includes five arrondissements—CLERMONT-FERRAND (*q.v.*), Ambert (town, 3940 inhabitants), Issoire (6137), Riom (9590), Thiers (10,583)—50 cantons, and 467 communes. It is attached to the bishopric of Clermont-Ferrand and to the 18th Army Corps in the same town; the superior court is at Riom. (G. ME.)

PYÆMIA. See **PATHOLOGY** (vol. xviii. p. 401) and **SURGERY**.

PYATIGORSK, a district town and watering-place of Caucasus, Russia, in the government of Terek, 124 miles by rail to the north-west of Vladikavkaz. It owes its origin to its mineral waters, which had long been known to the inhabitants of Caucasus, and even at the beginning of the present century attracted many Russians, who used to stay at the Konstantinogorsk fort, 2 miles off. The first buildings at the mineral springs were erected, however, in 1812, and in 1830 the name of Pyatigorsk ("town of the five mountains"), referring to the five summits of the Beshtau, was given to the new settlement. Its subsequent rapid increase was greatly stimulated by the completion of its railway connexion with Rostoff, and it has now nearly 14,000 inhabitants (13,670 in 1882). The town is charmingly situated on a small plateau on the south-western slopes of the Mashuka mountain, by which and the Beshtau it is protected on the north. The

snow-covered summits of the Elburz are seen on the south.

The sulphur springs, about fifteen in number, come from a great depth, from trachytic rocks, and vary in temperature from 72° to 115° Fahr.; they are used both for drinking and for bathing. Before the opening of the railway the summer patients already numbered thousands and have become more numerous since; but defective accommodation and high prices tend to prevent their further increase, notwithstanding the very high esteem in which these mineral waters are held by medical authorities, both Russian and West European. The industries of Pyatigorsk are insignificant, but its trade has always had some importance, and it is still visited during its fairs by a few Persian merchants.

PYGMALION is the Greek form of a Phœnician name probably derived from the name of a god, *עֲמָלִי* (*C.I.S.*, par. i. t. i. p. 133). Pygmalion or, as Josephus writes, Phygmalion, brother of Dido (Elissa), has been spoken of in *PHENICIA* (vol. xviii. p. 807). Another Pygmalion, son of Cilix and grandson of Agenor, king of Cyprus, is the subject of a famous story. He fell in love with an ivory statue he had made; Aphrodite granted life to the image, and Pygmalion married the miraculously born virgin (Ovid, *Metam.*, x. 243 sq.).

PYGMIES. The name "pygmy" (Greek *πυγμαῖος*, from *πυγμή*) means one whose height is measured by the distance between the elbow and the knuckles of an ordinary man, or rather less than an ell. The pygmies appear in Homer (*Il.*, iii. 6) as a tiny folk who dwelt by the streams of Ocean in the far southern land whither the cranes fly at the approach of our northern winter. The cranes made war on them and slaughtered them. These battles between the pygmies and the cranes are often mentioned by later writers and are frequently represented on vases. Philostratus describes a picture of the sleeping Hercules beset by swarms of pygmies, as Gulliver was by the Lilliputians. Aristotle held that the pygmies were a race of little men inhabiting the marshes out of which he supposed the Nile to flow. Other writers localized them in various parts of the world. Ctesias describes at some length a race of pygmies in the heart of India. They were black and ugly; the tallest of them were only two ells high; their hair and beards were so long that they served them as garments; they were excellent bowmen, and hunted hares and foxes with hawks, ravens, and eagles; their language and customs were those of the rest of the Indians, and they were very honest; their cattle were small in proportion. Pygmies are also mentioned in Thrace (where they were called Catizi by the natives, according to Pliny) and in Arabia. Eustathius speaks of pygmies in the far north, near Thule. Strabo was inclined to regard them as fabulous; no trustworthy person, he says, had seen them. There is, however, a story in Herodotus which would seem to show that the belief in the pygmies originated in well-founded reports of a race of undersized men in the heart of Africa. According to Herodotus (ii. 32), five men of the Nasamonians (a Libyan people near the Greater Syrtis) journeyed westward through the desert for many days till they came to a tribe of little black men of a strange speech, by whose city ran a great river flowing from west to east, and in it there were crocodiles; moreover, there were fruit-bearing trees in that country and great marshes. This story is not improbable; the river may have been the Niger (Joliba or Quorra) and the people may have been allied to the Akka. An undersized race discovered within recent years near the equator by Schweinfurth, who thinks that they, as well as the Bushmen of South Africa, are remnants of an aboriginal population of Africa now becoming extinct.

PYM, JOHN (1584-1643), was born at Brymore in Somerset in 1584. In 1599 he entered Broadgates Hall, now Pembroke College, Oxford, as a gentleman commoner. He is said by Clarendon to have held at a later date an office in the exchequer, in which he no doubt acquired that

familiarity with financial business which afterwards distinguished him. His wife, Anna Hooker, died in 1620, and in the following year he entered parliament for the first time as member for Calne, the statement that he sat in the Addled Parliament being now known to have been erroneous. To the patronage of the earl of Bedford no doubt Pym owed the position which he thus acquired. The use which he made of it was all his own. He had none of the fire of Eliot's genius, but he early showed himself to be possessed of the two qualities which in combination make a leader of men, a thorough and honest sympathy with the ideas of the time and a moderation in their application. There was more of measured force in him than there was in Eliot. His powers as a party leader were as yet unsuspected.

Pym's name was first prominently brought forward by his speech of 8th November 1621, directed against the Catholics. He strove to distinguish between an attempt "to punish them for believing and thinking" what they did and the disabling of them from doing "that which they think and believe they ought to do." His remedy was an oath of association to be taken by all loyal Protestants. Those who object to Pym's counsel as divisive must nevertheless acknowledge that there was a singular consistency in his advocacy of it. By organizing the resistance of the majority of Englishmen, he wished to baffle parties which might be dangerous by their organization or by the assistance which they might receive from abroad.

After the dissolution Pym was confined for three months in his house in London. In the following parliament he pleaded for the execution of the penal laws against recusants and for the restoration of the silenced Puritan clergy. In 1626 he was one of the managers of Buckingham's impeachment. In 1628 he was equally prominent in advocating the Petition of Right and in carrying on the impeachment of Mainwaring. The political question and the religious question were in Pym's mind fused into one. His intellect was intensely conservative, not easily admitting new ideas or projecting itself into the future to deal with growing changes in society, but seeking to rest on the conservatism of existing society rather than on the maintenance of artificial forces. He looked for support to the nation itself, and he found it hard to believe that the national judgment could much differ from his own. In 1629 he found himself differing from those with whom he usually acted. Eliot carried the House with him in turning the dispute with the king on the question of tonnage and poundage into one of parliamentary privilege, whilst Pym thought that the main question of the king's right to levy the duties without a parliamentary grant should be first attacked. He was beaten at the time, but his defeat was full of promise for the future. It is much in a man's favour that he is ready to look a difficulty fully in the face. It is characteristic of Pym that nothing is heard of him either during the riotous proceedings in which this parliament closed or during the eleven years which passed without a parliament at all. He had neither the virtues nor the failings which accompany excitability of temperament.

With the Short Parliament Pym's three and a half years of authority begin. His speech of 17th April 1640 on grievances lasted for two hours, a length of time without precedent in the parliaments of those days. It was not eloquent in the sense in which Eliot's speeches were eloquent, but it summed up in a telling manner the grievances under which, in the opinion of the vast majority of thinking Englishmen, the commonwealth laboured. Before the session closed he showed his powers as a parliamentary tactician by proposing to bring forward the Scottish grievances and to make a peace with the Scots the condition of the grant of supplies. This proposal led

to a hasty dissolution of parliament, but it laid down the basis of a policy which afterwards stood Pym in good stead. That policy was precisely what had been foreshadowed in his speech of 1621, the association of the majority who thought alike in civic union against official authority; but that which in 1621 was to be a union of Englishmen alone in 1640 included Scots as well.

With the dissolution of the Short Parliament Pym once more sinks out of sight. There is, however, good reason to suppose that the summer months of 1640 were for him a time of unusual activity, and that he was a leading spirit in those negotiations with the Scots the exact nature of which cannot now be traced. At all events in the end of August he was in close communication with the leaders of the opposition, and he then drew up, in co-operation with St John, the petition in which twelve peers demanded the redress of grievances and the summoning of parliament. The rout of Newburn gave emphasis to the language of the peers, and on 3d November 1640 the Long Parliament met.

Pym's leadership of the Commons rested on his sympathy with the feelings of the House combined with his skill in directing those feelings into a practical course. He expressed the general sentiment in the impeachment of Strafford and Laud, and in the passing of the Triennial Act, which was to make the long intermission of parliaments impossible for the future. In the trial of Strafford he showed himself resolute. Being determined to give to an act of state policy the character of a vindication of the law, Pym had to contend against the impatience of his followers and against the efforts of Charles, and still more of Henrietta Maria, to save Strafford by force. Overwhelmed for a moment by the impatience of the House, which converted the impeachment into a bill of attainder, he yet carried his point that the change should be no more than nominal, and that the legal arguments should proceed just as if the impeachment had been continued.

The struggle within the House itself was the least part of Pym's labours. In meeting the army plot and the other intrigues of the court he had to develop the powers of a commissioner of police, to be as ready in collecting and sifting information as he was prompt in counteracting the danger which he feared. In the protestation which was adopted by the Commons on 3d May he fell back on his old remedy, banding together the majority in resistance to an unscrupulous minority. By the legislation which followed on the death of Strafford—the abolition of the special courts which had been erected to defend the Tudor monarchy, and the abandonment by the crown of its claim to levy customs without a parliamentary grant—he brought the king under the obligation to govern according to law. Much, however, remained to be done. Pym had to provide against the breach by force or fraud of the compact made, and also to provide for the harmonious working of the executive and legislative bodies. He proposed to attain these ends by demanding that the king's ministers should be responsible to parliament. To effect this it was necessary that parliament should be united, and to obtain this end it was necessary to solve the religious difficulty. In the autumn of 1641 it appeared that a majority of the Peers and a large minority of the Commons wished to maintain the worship of the Prayer Book very nearly intact, whilst a minority of the Peers and a majority of the Commons wished to make very considerable alterations in it. To bind these two parties together against the king needed constructive statesmanship of the highest order, and this neither Pym nor any one else in the House showed signs of possessing. In the Grand Remonstrance, instead of indicating terms of compromise, he proposed to throw the regulation of the church on an assembly of divines to be

chosen by parliament,—that is to say, he combined the terrors of a vague threat of impending change with the entire absence of any security that those changes would be moderate. From that moment there were two parties in the state neither of which would give way to the other. Charles's attempt to arrest Pym and four other members on 4th January 1642 embittered but did not produce the conflict. For some months there was much fencing between the two parties, and the Civil War was not begun till Charles raised his standard at Nottingham.

During the remaining months of Pym's life he was the most prominent leader of the war party in the House of Commons. Peace may be made in two ways, by one side capitulating to the other, or by the discovery of a compromise which may give effect to the better aims of both sides. Pym was resolutely set against a capitulation, and he did not rise to the height of a mediator. His adversaries of the peace party, led by Holles and Maynard, had as little idea of a compromise as he had, and they were foolish enough to suppose it possible to obtain the assent of Charles and his supporters to the establishment of a Puritan Church.

Pym's policy was at least coherent with itself. In 1621, on his first prominent appearance in political life, he had advocated the formation of an association against popery. The protestation of 1641 was an attempt to carry this plan into practice and to make it at the same time available against Royalist intrigues. The Parliamentary covenant promulgated after the discovery of Waller's plot in June 1643 was an enlargement of the same project, and the Solemn League and Covenant in September 1643 embraced the three kingdoms. As long as he lived Pym was the soul of the Parliamentary resistance to the king, but it is in the covenants and associations which he brought into existence that his permanent contribution to English political development is to be found. Eliot hoped to rally parliament and the constituencies as a whole to the cause which he maintained to be just. Strafford hoped to rouse the devotion of the nation as a whole to the king whose crown was supported by his own masterful intellect. Pym was the founder of party government in England. He recognized from the first that there were differences of religious opinion amongst his fellow-countrymen, and he hoped to rally round a common purpose those who on the whole felt as he did himself, with such liberty of opinion as was possible under such conditions. If the enterprise failed it was partly because he was assailed by intrigue as well as by fair opposition, and in his fierce struggle against intrigue learned to cling to doctrines which were not sufficiently expansive for the government of a nation, partly because the limitations of government itself and the insufficiency of force to solve a complicated religious and political problem were in his time very imperfectly understood. At least Pym prepared the way for the immediate victory of his party by summoning the Scots and by the financial measures which made the campaigns of 1644 and 1645 possible.

He did not, however, live to reap the harvest which was due to his efforts. Worn out by the strain of constant and agitating work, his health broke down, and on 8th December 1643 he died. His body was followed by both Houses when it was carried to be interred in Westminster Abbey.

(S. R. G.)

PYRAMID. This name for a class of buildings, though first taken from a part of the structure,¹ and mistakenly applied to the whole of it by the Greeks, has now so far

acquired a more definite meaning in its geometrical sense that it is desirable to employ it in that sense alone. A pyramid therefore should be understood as meaning a building bounded by a polygonal base and plane triangular sides which meet in an apex. Such a form of architecture is only known in Middle Egypt, and there only during the period from the IVth to the XIIth Dynasty (before 2000 B.C.)—having square bases and angles of about 50°. In other countries various modifications of the tumulus, barrow, or burial-heap have arisen which have come near to this type; but these when formed of earth are usually circular, or, if square, have a flat top, and when built of stone are always in steps or terraces. The imitations of the true Egyptian pyramid at Abydos, Meroe, and elsewhere are puny hybrids, being merely chambers with a pyramidal outside and porticos attached; and the structures found at Cenchreæ, or the monument of Caius Sestius at Rome, are isolated and barren trials of a type which never could be revived: it had run its course in a country and a civilization to which alone it was suitable.

In the earliest monuments of Egypt there are three types, which were ruled by the external shape. For the temples (such as those of the kings of the IVth Dynasty at Gizeh) varied in shape according to their arrangements; but the pyramid, the obelisk, and the mastaba² are designs whose importance was outward; and these types, which started apparently at the same epoch (the earliest actually dated examples of each being all within the two reigns of Seneferu and Khufu), only lasted during the life of that archaic system to which they belonged. The pyramid type faded out in the middle kingdom (XIIth Dynasty); the obelisk was adapted in later times to a different purpose, as a member of bilateral temple decoration, instead of a solitary monument complete in itself and surrounded by an enclosure, as it was in the old kingdom; and the mastaba gave way to the rock-hewn chapel or the bastard pyramid.

In considering the origin of the pyramid type there are three theories to be dealt with—(1) that it is merely a higher and refined form of the tumulus; (2) that it was derived from the mastaba; (3) that it was a fresh idea, an invention *de novo*. The objection to the first view is that there is no graduated series of examples of lesser sizes before the large ones, possibly not any before the very largest, and that tumulus or mound burial is unknown in Egypt, ancient or modern; and to accept this view we must suppose that all the earlier stages were wrought in another land, and that the pyramid-builders migrated into Egypt when at the height of their architectural power. But their history does not agree to this, and in no other land can we find their training-ground. The second view is strongly suggested by the facts before us in Egypt. The only buildings that have been reasonably supposed to be earlier than the great pyramid are the two so-called pyramids of Sakkara and Medum. These structures are not and never were true pyramids; they are mastabas added to by successive accretions at various times, again and again finished off with a polished casing, only to be afresh enlarged by coats of rough masonry and another fine casing on the outside, until they have been extended upwards and around into a great stepped mass of masonry (Petrie, *Pyramids, &c.*, p. 147), the successive faces of which rise at the characteristic mastaba angle of 75° (or 4 on 1). These buildings then present the outline of a pyramidal pile, broken by successive steps, and it is but one stage further to build in one smooth slope from base to top; such a form would readily be designed when once it was intended to build a large mass complete at

¹ The vertical height was named by the Egyptians *pir-em-us* (see E. Revillout, *Rev. Eg.*, 2d year, 305-309), hence the Greek form *pyramis*, pl. *pyramides* (Herod.), used unaltered in the English of Sandys (1615), from which the singular *pyramid* was formed.

² An oblong building with sloping sides and flat top, which contained usually the funeral chapel and place of offerings, and covered over the mouth of the sepulchral pit.

once on one uniform plan, as certainly was the case for the largest pyramids. The third view has some support in the absence of any datable pyramids before the largest and the second largest that ever existed, and in the steady deterioration of work that is known to have taken place. Remembering also what bold steps architecture has taken occasionally in later times (as in the Pantheon and St Sophia) without a series of graduated examples, we should not condemn this view too readily by *a priori* reasoning.

It is certain that the pyramids were each begun with a definite design of their size and arrangement; at least this is plainly seen in the two largest, where continuous accretion (such as Lepsius and his followers propound) would be most likely to be met with. On looking at any section of these buildings it will be seen how impossible it would have been for the passages to have belonged to a smaller structure (Petrie, 165). The supposition that the designs were enlarged so long as the builder's life permitted was drawn from the compound mastabas of Sakkara and Medum; these are, however, quite distinct architecturally from true pyramids, and appear to have been enlarged at long intervals, being elaborately finished with fine casing at the close of each addition.

Around many of the pyramids peribolus walls may be seen, and it is probable that some enclosure originally existed around each of them. At the pyramids of Gizeh the temples attached to these mausolea may be still seen. As in the private tomb, the false door which represented the exit of the deceased person from this world, and towards which the offerings were made, was always on the west wall in the chamber, so the pyramid was placed on the west of the temple in which the deceased king was worshipped. The temple being entered from the east (as in the Jewish temples), the worshippers faced the west, looking toward the pyramid in which the king was buried. Priests of the various pyramids are continually mentioned during the old kingdom, and the religious endowments of many of the priesthoods of the early kings were revived under the Egyptian renaissance of the XXVth Dynasty and continued during Ptolemaic times. A list of the hieroglyphic names of nineteen of the pyramids which have been found mentioned on monuments (mostly in tombs of the priests) is given in Lieblein's *Chronology*, p. 32. The pyramid was never a family monument, but belonged—like all other Egyptian tombs—to one person, members of the royal family having sometimes lesser pyramids adjoining the king's (as at Khufu's); the essential idea of the sole use of a tomb was so strong that the hill of Gizeh is riddled with deep tomb-shafts for separate burials, often running side by side 60 or 80 feet deep with only a thin wall of rock between; and in one place a previous shaft has been partially blocked with masonry, so that a later shaft could be cut partly into it, maced with it like a twin-crystal.

Turning now to the architecture of the buildings, their usual construction is a mass of masonry composed of horizontal layers of rough-hewn blocks, with a small amount of mortar; and this mass in the later forms became more and more rubbly, until in the VIth Dynasty it was merely a cellular system of retaining walls of rough stones and mud, filled up with loose chips, and in the XIIth Dynasty the bulk was of mud bricks. Whatever was the hidden material, however, there was always on the outside a casing of fine stone, elaborately finished, and very well jointed; and the inner chambers were of similarly good work. Indeed the construction was in all cases so far sound that, had it not been for the spite of enemies and the greed of later builders, it is probable that every pyramid would have been standing in good order at this day. The casings were not a mere "veneer" or "film,"

as they have been called, but were of massive blocks, usually greater in thickness than in height, and in some cases (as at South Dahshur) reminding the observer of horizontal leaves with sloping edges.

Inside of each pyramid, always low down, and usually below the ground level, was built a sepulchral chamber; this was reached in all cases by a passage from the north, sometimes beginning in the pyramid face, sometimes descending into the rock on which the pyramid was built in front of the north side. This chamber, if not cut in the rock altogether (as in Menkaura's), or a pit in the rock roofed with stone (as in Khafra's), was built between two immense walls which served for the east and west sides, and between which the north and south sides and roofing stood merely in contact, but unbonded. The gable roofing of the chambers was formed by great sloping cantilevers of stone, projecting from the north and south walls, on which they rested without pressing on each other along the central ridge; thus there was no thrust, nor were there any forces to disturb the building; and it was only after the most brutal treatment, by which these great masses of stone were cracked asunder, that the principle of thrust came into play, though it had been provided for in the sloping form of the roof, so as to delay as long as possible the collapse of the chamber. This is best seen in the pyramid of Pepi (Petrie), opened from the top right through the roof. See also the Abusir pyramids (Howard Vyse) and the king's and queen's chambers of the great pyramid (Howard Vyse, Piazzi Smyth, Petrie). The roofing is sometimes, perhaps usually, of more than one layer; in Pepi's pyramid it is of three layers of stone beams, each deeper than their breadth, resting one on another, the thirty stones weighing more than 30 tons each. In the king's chamber (Gizeh) successive horizontal roofs were interposed between the chamber and the final gable roof, and such may have been the case at Abu Roash (Howard Vyse).

The passages which led into the central chambers have usually some lesser chamber in their course, and are blocked once or oftener with massive stone portcullises. In all cases some part, and generally the greater part, of the passages slopes downwards, usually at an angle of about 26°, or 1 on 2. These passages appear to have been closed externally with stone doors turning on a horizontal pivot, as may be seen at South Dahshur, and as is described by Strabo and others (Petrie). This suggests that the interiors of the pyramids were accessible to the priests, probably for making offerings; the fact of many of them having been forcibly entered otherwise does not show that no practicable entrance existed, but merely that it was unknown, as, for instance, in the pyramids of Khufu and Khafra, both of which were regularly entered in classical times, but were forced by the ignorant Arabs.

The pyramids of nearly all the kings of the IVth, Vth, and VIth Dynasties are mentioned in inscriptions, and also a few of later times. The first which can be definitely attributed is that of Khufu (or Cheops), called "the glorious," the great pyramid of Gizeh. Ratatuf, who appears next to Khufu in the lists, is unknown in other monuments; he is perhaps the same as Khnumu-Khufu, apparently a co-regent of Khufu, who may have been buried in the so-called queen's chamber of the great pyramid. Khafra rested in the great pyramid, now known as the second pyramid of Gizeh. Menkaura's pyramid was called "the upper," being at the highest level on the hill of Gizeh. The lesser pyramids of Gizeh, near the great and third pyramids, belong respectively to the families of Khufu and Khafra (Howard Vyse). The pyramid of a Men(ka?)ra at Abu Roash is probably also of this period. The pyramid of Aseskaf, called "the cool," is unknown, so also is that of Userkaf of the Vth Dynasty, called the "holiest of buildings." Sahura's pyramid, the north one of Abusir, was named "the rising soul," much as Neferkara's (of unknown site) was named "of the soul." Raenuser's pyramid, "the firmest of buildings," is the middle pyramid of Abusir. The pyramid of Menkanhor, called "the most divine building," is somewhere at Sakkara. Assa's pyramid is unidentified; it was "the beautiful." Unas not only built the

mastaba Farin, long supposed to be his pyramid, but had a pyramid called "the most beautiful of buildings" at Sakkara, which was opened in 1881 (see *Recueil des Travaux*, by M. Maspero, iii., for those opened at Sakkara). In the Vith Dynasty the "pyramid of souls," built by Ati (Rauserkar), is unknown. That of Teta, "the most stable of buildings," was opened at Sakkara in 1881, as well as that of Pepi (Rameri), "the firm and beautiful." The pyramids of Rameren, "the beautiful rising," and of Neferkara, "the firm life," are unknown. Haremsaf's pyramid was opened at Sakkara in 1881. Of the last two kings of the Vith Dynasty we know of no pyramids. In the VIIth or VIIIth Dynasty most probably the brick pyramids of Dahshur were erected. In the XIth Dynasty the pyramid, "the most glorious building," of Mentuhotep II. is mentioned, and the mud pyramid of one of the Antef kings is known at Thebes. In the XIIth Dynasty the pyramids, the "lofty and beautiful" of Amenemhat I. and "the bright" of Usertesen II. are known in inscriptions, while the brick pyramid at Howara may be most probably assigned to Amenemhat III., who appears to have built the adjoining temple.

Of the architectural peculiarities of some particular pyramids some notice must now be given. The great pyramid of Gizeh (Khufu's) is very different in its internal arrangements from any other known (see vol. ii. p. 385 sq. and vol. vii. p. 771 sq.). The greater number of passages and chambers, the high finish of parts of the work, and the accuracy of construction all distinguish it. The chamber which is most normal in its situation is the subterranean chamber; but this is quite unfinished, hardly more than begun. The upper chambers, called the "king's" and "queen's," were completely hidden, the ascending passage to them having been closed by plugging blocks, which concealed the point where it branched upwards out of the roof of the long descending passage. Another passage, which in its turn branches from the ascending passage to the queen's chamber, was also completely blocked up. The object of having two highly-finished chambers in the mass may have been to receive the king and his co-regent (of whom there is some historical evidence), and there is very credible testimony to a sarcophagus having existed in the queen's chamber, as well as in the king's chamber. On the details of construction in the great pyramid it is needless to enter here; but it may be stated that the accuracy of work is such that the four sides of the base have only a mean error of six-tenths of an inch in length and 12 seconds in angle from a perfect square.¹

The second pyramid of Gizeh has two separate entrances (one in the side, the other in the pavement) and two chambers (one roofed with slabs, the other all rock-hewn); these chambers, however, do not run into the masonry, the whole bulk of which is solid so far as is known. This pyramid has a part of the original casing on the top; and it is also interesting as having the workmen's barracks still remaining at a short distance on the west side, long chambers capable of housing about 4000 men. The great bulk of the rubbish from the work is laid on the south side, forming a flat terrace level with the base, and covering a steep rock escarpment which existed there. The waste heaps from the great pyramid were similarly tipped out over the cliff on its northern side. Thus the rubbish added to the broad platform which set off the appearance of the pyramids; and it has remained undisturbed in all ages, as there was nothing to be got out of it. The third pyramid was cased around the base with red granite for the sixteen lowest courses. The design of it has been enlarged at one bound from a small pyramid (such as those of the family of Khufu) to one eight times the size, as it is at present; the passages needed therefore to be altered. But there is no sign of gradual steps of enlargement: the change was sudden, from a comparatively small design to a large one. The basalt sarcophagus of this pyramid was ornamented with the panel decoration found on early tombs, unlike the granite sarcophagi of the two previous pyramids, which are plain. Unhappily it was lost at sea in 1838.

Farther south are the pyramids of Abusir, the most complete account of which is in the work of Colonel Howard Vyse. Next come those of Sakkara. The construction of the step-pyramid or cumulative mastaba has been noticed above; its passages are very peculiar and intricate, winding around the principal chamber, which is in the centre, cut in the rock, very high, and with a tomb-chamber built in the bottom of it, which is closed with a great plug of red granite, a circular stopper fitting into a neck in the chamber roof. A doorway faced with glazed tiles bearing a king's standard existed here; the tiles were taken to Berlin by Lepsius. The other pyramids of Sakkara are of the VIth Dynasty, of Unas, Pepi, Haremsaf, &c. They are distinguished by the introduction of very long religious texts, covering the whole inside of the chambers and passages; these are carefully carved in small hieroglyphics, painted bright green, in the white limestone. Beyond

these come the pyramids of Dahshur, which are in a simple and massive style, much like those of Gizeh. The north pyramid of Dahshur has chambers roofed like the gallery in the great pyramid by successive overlappings of stone, the roof rising to a great height with no less than eleven projections on each side. The south pyramid of Dahshur has still the greater part of its casing remaining, and is remarkable for being built at two different angles, the lower part being at the usual pyramid angle, while the upper part is but 43°. This pyramid is also remarkable for having a western passage to the chambers, which was carefully closed up. Beyond the Memphitic group are the scattered pyramids of Lisht, Illahun, and Howara, and the cumulative mastaba of Medum. Illahun is built with a framework of stone filled up with mud bricks, and Howara is built entirely of mud bricks, though doubtless cased with fine stone like the other pyramids.

Beyond these there are no true pyramids, but we will briefly notice those later forms derived from the pyramid. At Abydos a large cemetery is covered with more than a hundred mud-brick chambers, the outsides of which are sloped to the form of an acute pyramid, and which have a door (or in later forms a large chamber) projecting on one side. These differ from true pyramids in (1) having an attachment more or less large on one face, (2) being always built on a square plinth, (3) having the principal face generally south, and but rarely to the north, (4) not being oriented, and (5) having the chambers occupying the greater part of the structure. The sizes are about 18 feet wide and 24 high, with a chamber 11 feet wide and 13 high, and in the later and less acute forms 20 feet base and 21 in height (see Mariette, *Abydos, Description des Fouilles*, ii. 43). At Thebes are also some similar structures belonging to the kings of the XIth Dynasty; the tomb-chamber is, however, in the rock below. The size is not so insignificant, but is under 50 feet square. These, like those at Abydos, are not oriented, and have a horizontal entrance, quite unlike the narrow pipe-like passages sloping down into the regular pyramids (see Mariette, in *Bib. Arch. Trans.*, iv. 193). In Ethiopia, at Gebel Barkal, are other so-called pyramids of a very late date. They nearly all have porches; their simplicity is lost amid very dubious decorations; and they are not oriented. They are all very acute, and have flat tops as if to support some ornament. The sizes are but small, varying from 23 to 88 feet square at Gebel Barkal and 17 to 63 feet square at Meroe. The interior is solid throughout, the windows which appear on the sides being useless architectural members (see Hoskin's *Ethiopia*, 148, &c.). The structures sometimes called pyramids at Bahmu in the Fayum seem to have no possible claim to such a name, though they are certainly of early work. Judging by the account of Herodotus (which seems intended to apply to them), by the present name (Pharaoh's thrones), and the actual remains, it appears that they were two great enclosed courts with sloping sides, in the centres of which were two seated statues raised on pedestals high enough to be seen over the walls of the courts. This form would appear like a pyramid with a statue on the top; and a rather similar case in early construction is shown on the sculptures of the old kingdom. Obelisks then were single monuments (not in pairs) and stood in the midst of a great courtyard with sides sloping like a mastaba; such open courtyards on a small scale are found in the mastabas at Gizeh, and are probably copied from the domestic architecture of the time.

On the vexed question of inscriptions on the pyramids it will suffice to say that not one fragment of early inscription is known on the casing of any pyramid, either *in situ* or broken in pieces. Large quantities of travellers' "graffiti" doubtless existed, and some have been found on the casing of the great pyramid; these probably gave rise to the accounts of inscriptions, which are expressly said to have been in many different languages.

The mechanical means employed by the pyramid-builders have been partly ascertained. The hard stones, granite, diorite, and basalt were in all fine work sawn into shape by bronze saws set with jewels (either corundum or diamond), hollows were made (as in sarcophagi) by tubular drilling with tools like our modern diamond rock-drills (which are but reinvented from ancient sources, see *Engineering*, xxxvii. 282), and small articles were turned in lathes fitted with mechanical tool-rests and jewel-pointed tools. The details of the questions of transport and management of the large stones remain still to be explained.

Works referred to above.—Colonel Howard Vyse, *Operations at the Pyramids*, 1840; Professor C. Piazzzi Smyth, *Life and Work at the Great Pyramid*, 1857; W. M. Flinders Petrie, *Pyramids and Temples of Gizeh*, 1883. (W. M. F. P.)

PYRENEES, a range of mountains stretching with a general trend 18° to the north of west between France and Spain, from Cape Creus, or more properly Cap de Cerbera, on the Mediterranean to the Bay of Biscay. The length of the range is about 240 miles, the greatest breadth little more than 50 miles (exclusive of the lower parallel ranges on the Spanish side), and the area covered

¹ With respect to the construction of this and other pyramids, see Howard Vyse; on measurements of the inside of the great pyramid and descriptions, see Piazzzi Smyth; and on measurements in general, mechanical means, and theories, see Petrie.

by it about 13,000 square miles. For the most part the crest of the main chain constitutes the Franco-Spanish frontier; the principal exception to this rule is formed by the valley of Aran, which, belonging orographically to France but politically to Spain, is closed at the head by a transverse ridge running north and south and connecting the eastern and western halves of the chain.

The whole range is remarkable for its regularity. The main chain is on the whole easy to trace; its continuity is unbroken, and the variations in its height are mostly confined within narrow limits. The same regularity is seen in the arrangement of the valleys. Except that of Aran, all the principal valleys are given off at right angles, or nearly so, like the pinnæ of a fern-frond, on both sides of the chain, and they are again subdivided by similar minor valleys at right angles to them. In all these respects the Pyrenees contrast in a very marked manner with the Alps. They have none of the great longitudinal valleys so characteristic of the latter range, none of the great lakes by which such valleys are occupied, and but few passes like those which are found in plenty leading across the great chains of the Alps at a level much below that of the adjoining peaks. In this last particular, indeed, the Pyrenees are conspicuously deficient. Between the two extremities of the range, where the principal highroads and the only railways run between France and Spain, there are only two passes practicable for carriages,—the Col de la Perche between the valley of the Tet and the valley of the Segre, and the Col de Somport or Port de Canfranc (where it is now proposed to pierce the range by a railway tunnel) on the old Roman road from Saragossa to Oloron.

This latter pass marks the western extremity of what are known as the Central Pyrenees, which extend eastwards to the valley of Aran and include the highest summits of the whole range—Pic de Néthou or Maladetta (11,165 feet), Posets (11,047 feet), Mont Perdu (10,994 feet, Reclus; other authorities, 11,430 feet). In the Atlantic Pyrenees to the west of that pass the average height gradually but steadily diminishes till we come to the Mediterranean, while in the Eastern Pyrenees, with the exception of one break at the eastern extremity of the Pyrénées Ariégeoises, the mean elevation is maintained with remarkable uniformity, till at last a rather sudden decline occurs in the portion of the chain known as the Albères.

Narrow as the range is, the inclination of a straight line drawn from the base to the crest on the French side is not more than 3°, or a rise of about 6 in 100. On the Spanish side it is said to be somewhat steeper, but this has not been definitely ascertained. This fact, however, gives no idea of the general character of the Pyrenean slopes. The descent from the crest to the plains is marked by a succession of terraces terminating in abrupt precipices. On the French side a long cliff marks the northern limit of the chain for the greater part of its length, and this feature is particularly well defined in the department of Aude, where a steep precipice marks the division between the true Pyrenees and the Corbières, a minor chain remarkable for the complexity of its geological structure, stretching in that department from south-west to north-east.

Besides these longitudinal precipices marking the steps in the descent from the summit-line to the plains, the transverse valleys almost everywhere form profound ravines, at the bottom of which brawls the innumerable mountain-torrents ("gaves," as they are locally called) that form the principal feature in the hydrography of the range. Frequently they form lofty cascades, surpassed in Europe only by those of Scandinavia. The highest is that of Gavarnie at the head of the Gave de Pau, 1515

feet high. The wildness which thus in general marks the scenery of the Pyrenees is even greater on the Spanish than on the French side.

A peculiar and very striking feature in the Pyrenean valleys is the frequency with which their upper end assumes the form of a semicircle of precipitous cliffs. Such basins are called "cirques," and the most noted is that at the head of the valley just mentioned, the Cirque de Gavarnie. The origin of this form of valley is still a matter of discussion among geologists. Geologically the Pyrenees consist, like the Alps, of a core of granite overlaid by sedimentary strata of various age down to the Tertiary period. The granite is exposed chiefly in the east and centre, and appears in the west only in comparatively small isolated patches. Above the granitic core Cambro-Silurian rocks are very extensively developed, especially in the west, and it would appear that the first upheaval on the site of the present Pyrenees took place after the deposition of the rocks of this age, since those of the next epochs in geological history, the Old Red Sandstone, the Carboniferous, and probably also the Permian, are almost entirely unrepresented. The Secondary rocks down to the Lower Cretaceous were deposited perfectly conformably upon one another, probably against the slopes of a gentle ridge rising out of the water. Among these, Triassic rocks occupy a considerable area in the west on both slopes of the mountains; those of Jurassic age are likewise found on both slopes, but at different points; while the Lower Cretaceous form an almost continuous band on the north and one quite continuous on the south. After the deposition of the last-mentioned strata a second upheaval took place, and then another period of quiet deposition, during which the Upper Cretaceous and Eocene beds were laid down, was brought to a conclusion by the grand upheaval which elevated the Pyrenees into one of the great mountain-chains of Europe and imparted to them the general outline of their present relief. The last deposits of the Eocene sea in this quarter, represented on the French side by the conglomerates of Palusson, have been raised by this upheaval up the slopes of the mountains, and are succeeded by the Miocene lacustrine molasse, which lies perfectly horizontally at their base. The next and last upheaval was one that did not affect the Pyrenees separately, but raised the whole area on which they stand, causing the emergence from beneath the sea of the region of the Landes and draining the lake that washed the foot of the Pyrenees on the east, thus establishing the present land connexion between France and the Iberian Peninsula.

The later rocks of the Pyrenees are to a large extent limestones, among which are conspicuous the characteristic hippuritic limestone of the southern Chalk and the nummulitic limestone of the southern Eocene. For the most part the highest peaks belong to the granitic core of the mountains. But this is not always the case. In some instances limestone rocks have been carried up to the very crest of the mountains, as in Mont Perdu and in Marboré; the name of the latter, meaning "marble," indicates the nature of its constituent rock. Such limestone summits have a characteristic square massive form, very different from the sharp peaks of the granite and the schists. As in other limestone regions, caves are numerous in the Pyrenees, and several of these are of great interest to geologists and anthropologists on account of the traces of recent geological changes observable in them, and the remains of early man, both Palæolithic and Neolithic, which they have yielded.

The metallic ores of the Pyrenees are not in general of much importance, though there are considerable iron mines at Vic de Sos in Ariège and at the foot of Canigou in Pyrénées Orientales. Coal-deposits capable of being profitably worked are situated chiefly on the Spanish slopes, but the French side has numerous beds of lignite. Mineral springs are abundant and very remarkable, and specially

noteworthy are the hot springs, in which the Alps, on the contrary, are very deficient. The latter, among which those of Bagnères de Luchon and Eaux-Chaudes may be mentioned, are sulphurous and mostly situated high, near the contact of the granite with the stratified rocks. The lower springs, such as those of Bagnères de Bigorre (Hautes-Pyrénées), Rennes (Aude), and Campagne (Aude), are mostly selenitic and not very warm.

The amount of the precipitation, including rain and snow, is much greater in the Western than in the Eastern Pyrenees, which leads to a marked contrast between the two halves of the chain in more than one respect. In the first place, the Eastern Pyrenees are without glaciers, the quantity of snow falling there being insufficient to lead to their development. The glaciers are confined to the northern slopes of the Central Pyrenees, and do not descend, like those of the Alps, far down in the valleys, but have their greatest length in the direction of the mountain-chain. They form in fact a narrow zone near the crest of the highest mountains. Here, as in the other great mountain ranges of central Europe, there are evidences of a much wider extension of the glaciers during the Ice age. The case of the glacier in the valley of Argeles in the department of Hautes-Pyrénées is the best-known instance. The snow-line is stated to lie in different parts of the Pyrenees at from 8800 to 9200 feet above sea-level.

A still more marked effect of the preponderance of rainfall in the western half of the chain is seen in the aspect of the vegetation. The lower mountains in the extreme west are very well wooded, but the extent of forest declines as we go eastwards, and the Eastern Pyrenees are peculiarly wild and naked, all the more since it is in this part of the chain that granitic masses prevail. There is a change, moreover, in the composition of the flora in passing from west to east. In the west the flora, at least in the north, resembles that of central Europe, while in the east, though the difference of latitude is only about 1°, on both sides of the chain from the centre whence the Corbières stretch north-eastwards towards the central plateau of France it is distinctly Mediterranean in character. The Pyrenees are relatively as rich in endemic species as the Alps, and among the most remarkable instances of that endemism is the occurrence of the sole European species of *Dioscorea* (yam), the *D. pyrenaica*, on a single high station in the Central Pyrenees, and that of the monotypic genus *Xatardia*, only on a high alpine pass between the Val d'Eynes and Catalonia. The genus most abundantly represented in the range is that of the saxifrages, several species of which are here endemic.

In their fauna also the Pyrenees present some striking instances of endemism. There is a distinct species of ibex (*Capra pyrenaica*) confined to the range, while the Pyrenean desman or water-mole (*Mygdale pyrenaica*) is found only in some of the streams of the northern slopes of these mountains, the only other member of this genus being confined to the rivers of southern Russia. Among the other peculiarities of the Pyrenean fauna are blind insects in the caverns of Ariège, the principal genera of which are *Anophthalmus* and *Adelops*.

See Murray's *Handbook of France*; A. Leymerle, *Description géologique et paléontologique des Pyrénées de la Haute Garonne* (to which a general account of the chain is prefixed), Toulouse, 1881; De Chausenque, *Les Pyrénées*, 1854; for the vegetation, Bentham, *Catalogue des Plantes indigènes des Pyrénées et de Bas-Languedoc*, Paris, 1826, and Grisebach, *Vegetation der Erde*, Leipzig, 1872; and for an account of the caverns, Geikie, *Prehistoric Europe*, and the authorities there cited. For the French side of the Pyrenees the best map is that of the Government survey on the scale of 1:250,000 (about an inch to the mile). The first sheet of a map by Fr. Schrader of the Spanish slopes on the scale of 1:250,000 has been published under the title *Pyrénées Centrales avec les grands Massifs du Versant espagnol*; and a sketch map of the whole of the Spanish slopes based on the tracings of MM. Schrader, Wallon, and Saint-Sand was published in vol. vii. (1880) of the *Annuaire du Club alpin français*, and also separately. See also the maps in Murray's *Handbook*. (G. G. C.)

PYRÉNÉES, the name of three departments in the south of France.

1. **BASSES-PYRÉNÉES**, a department of south-western France, at the angle of the Bay of Biscay, was formed in 1790, two-thirds of it from Béarn and the rest from three districts of Gascony—Navarre, Soule, and Labourd—which together constitute the Basque region of France. The department lies between 42° 46' and 43° 36' N. lat. and between 0° 6' E. and 1° 47' W. long., and is bounded on the N. by Landes and Gers, on the E. by Hautes-Pyrénées (which has two enclaves, forming five communes, within this department), on the S. by Spain, and on the W. by the ocean. The name is due to the fact that the peaks of the Pyrenees on its southern frontier are lower than in the neighbouring department. Their height increases gradually from west to east. The peak of the Rhune, to the south of St Jean de Luz, rises only to 2950 feet; and on the border of the Basque country, which occupies the western half of the department, the mean height of the summits is not much greater. The peak of

Orhy alone, in the south of the valley of Mauléon, reaches 6618 feet. But beyond that of Anie (8215 feet), on the meridian of Orthez, which marks the boundary of Béarn, much loftier elevations appear,—Mourous (9760 feet), on the border of Hautes-Pyrénées, and the southern peak of Ossau (9465 feet). The frontier between France and Spain follows the crest-line of the main range, except in a few cases mentioned below. The general direction of the rivers of the department is towards the north-west, through a hilly country for the most part wooded or vine-clad, except on the higher slopes, which are grassy. The northern half of the department is covered with bracken or heath, indicating the proximity of the "landes." The streams almost all meet in the Adour through the Gave de Pau, the Bidouze, and the Nive. In the north-east the two Luys flow directly to the Adour, which they join in Landes. In the south-west the Nivelle and the Bidassoa flow directly into the sea. The lower course of the Adour forms the boundary between Basses-Pyrénées and Landes; it enters the sea a short distance below Bayonne over a shifting bar, which has often altered the position of its mouth. The Gave de Pau, a larger stream than the Adour, passes Pau and Orthez, but its current is so swift that it is only navigable for a few miles above its junction with the Adour. On the left it receives the Gave d'Oloron, formed by the Gave d'Ossau, descending from the Pic du Midi, and the Gave d'Aspe, which rises in Spain. The second important affluent of the Gave de Pau, the Saison or Gave de Mauléon, descends from the Pic d'Orhy. From the Pic des Escaliers, which rises above the forest of Iraty, the Bidouze descends northwards; while the forest, though situated on the southern slope of the chain, forms a part of French territory. The Nive, a pretty river of the Basque country, takes its rise in Spain; after flowing past St Jean Pied de Port, it joins the Adour at Bayonne. The Nivelle also belongs only partly to France and ends its course at St Jean de Luz. The Bidassoa, which is only important as forming part of the frontier, contains the Île des Faisans, where the treaty of the Pyrenees was concluded (1659), and debouches between Hendaye (France) and Fontarabia (Spain).

The climate of the department is essentially that of the Gironde in the valleys,—mild and damp. The spring is rainy; the best seasons are summer and autumn, the heat of summer being moderated by the sea. The winters are mild. The very calm air of Pau (see PAU) agrees with invalids and delicate constitutions. St Jean de Luz and Biarritz are much frequented by winter visitors.

The department is mainly agricultural, 287,719 of its inhabitants being dependent on this industry (Reclus). In 1881, of a total area of 1,883,667 acres 129,182 were under wheat and produced 217,412 quarters; the other figures were—barley, 4188 acres, 7137 quarters; buckwheat, 455 acres, 761 quarters; oats, 12,800 acres, 22,327 quarters; maize, 161,736 acres, 354,055 quarters; meslin, 2600 acres, 3987; rye, 2308 acres, 3536; flax, 13,309 acres, 9348 quarters; potatoes, 7067 acres, 158,592 bushels; vineyards, 63,511 acres, 4,019,466 gallons of wine (the most highly esteemed vintage being that of Jurançon). From 25,205 acres were produced 642,760 bushels of dried vegetables, and 18,781 acres of chestnut trees yielded 314,480 bushels of chestnuts. There are 163,613 acres of pastures and grazing-lands, 132,342 of permanent meadows and orchards, 28,595 under green crops, and 612,000 acres of waste lands. The live stock numbered 27,845 horses, 9110 mules, 15,409 asses, 139,818 horned cattle, 434,130 sheep (giving 300 tons of wool, worth £18,000), 78,310 pigs, 150,608 goats, and there were 16,000 hives of bees (producing 63 tons of honey and 18 of wax). One-half of the 386,000 acres of forest belongs to private persons, the other almost wholly to the communes or the department, scarcely any woods belonging to the Government. Forest management receives careful attention. The number of inhabitants employed in manufactures was 67,455. There are mines of anthracite, copper, iron, lead, zinc, silver, and kaolin in small quantity. The salt produced amounted to 9663 tons and is used partly for the famous Bayonne hams (so called, but really prepared in the neighbourhood of Orthez). The department has valuable mineral springs

The Eaux-Bonnes, hot and cold, containing sodium and sulphur, are employed especially for disorders of the chest and respiratory organs. The Eaux-Chaudes, of like composition, are efficacious in catarrh, rheumatism, and skin diseases. Those of Cambo on the Nive, some hot and sulphurous, some chalybeate and cold, are much frequented by the Basques on the eve of St John. The waters of St Christau, near Oloron, containing copper, are efficacious in skin diseases. The manufactures of the department include woollen caps and sashes, the fez worn by the people of the district, nets, Béarn linen, cord slippers, chocolate, and there are also tanneries and flour-mills. The only shipping port is Bayonne, which town is also the meeting-place of the roads to St Sebastian and Pamplona in Spain. Within the department there are 258 miles of Government roads and 7460 of departmental or parish roads. There are also 142 miles of railroad, connecting Bayonne with Toulouse, Dax with Puyoo (for Pau), Bayonne with Biarritz, Puyoo with St Palais, and Pau with Laruns (Eaux-Bonnes). The population in 1881 was 434,366 (57 per square kilomètre), almost entirely Catholic. There are five arrondissements—Pau, Bayonne, Oloron, Orthez (population of town, 4657), and Mauléon (2038), divided into 40 cantons and 558 communes. Basses-Pyrénées constitutes the diocese of Bayonne, and is attached to the superior court of Pau and belongs to the district of the 18th Army Corps (Bordeaux).

2. HAUTES-PYRÉNÉES, a department of southern France, on the Spanish frontier, was formed in 1790, half of it being taken from Bigorre and the remainder from Armagnac, Nébouzan, Astarac, and Quatre Vallées, districts which all belonged to the province of Gascony. It lies between 42° 40' and 43° 37' N. lat. and between 19° W. and 39° E. long., and is bounded on the south by Spain, on the west by the department of Basses-Pyrénées, on the north by Gers, and on the east by Haute-Garonne. Except on the south its boundaries are conventional. Some of the Pyrenean peaks in this department reach or exceed the height of 10,000 feet, the Vignemale (10,820 feet) being the highest in French territory. The imposing corries, with their glaciers and waterfalls, and the pleasant valleys attract a large number of tourists, the most noted point being the famous Gavarnie. The northern portion of the department consists of plains, or rather fertile valleys, clothed with corn-fields, vineyards, and meadows. To the north-east, however, the cold and wind-swept plateau of Lannemezan (about 2000 feet), the watershed of the streams that come down on the French side of the Pyrenees, presents in its bleakness and barrenness a striking contrast to the plain that lies below. The department is drained by three principal streams, the Gave de Pau, the Adour, and the Neste, an affluent of the Garonne. The sources of the first and third lie close together in the Cirque of Gavarnie and on the slopes of Troumouse, whence they flow respectively to the north-west and north-east. An important spur of the Pyrenees, which carries the Pic de Néouvielle and the Pic du Midi de Bigorre, projects to the northward between these two valleys. From the Pic du Midi the Adour descends, which, after watering the pleasant valley of Campan, leaves the mountains at Bagnères and then divides into a multitude of channels, which irrigate the rich plain of Tarbes. Beyond Hautes-Pyrénées it receives on the right the Arros, which flows through the department from south to north-north-west; on the left it receives the Gave de Pau. This latter stream, rising in Gavarnie, is joined at Luz by the Gave de Bastan from Néouvielle, and at Pierrefitte by the Gave de Caunterets, fed by streams from the Vignemale. The Gave de Pau, after passing Argelès and the grotto of Lourdes on its left and the château of Lourdes on its right, leaves the mountains and turns sharply from north to north-north-west; it has a greater volume of water than the Adour, but, being more of a mountain torrent, is regarded as a tributary of the Adour, which is navigable in the latter part of its course. The Neste d'Aure, descending from the peaks of Néouvielle and Troumouse, receives the Neste de Louron from the pass of Clarabide at

Arreau and flows northwards through a beautiful valley as far as Labarthe, where it turns to the north-east; it is important as furnishing the plateau of Lannemezan with a feeding canal, the waters of which are partly used for irrigation and partly for supplying the streams that rise there and are dried up in summer,—the Gers and the Baise, affluents of the Garonne. This latter only touches the department. The climate of Hautes-Pyrénées, though very cold on the highlands, is warm and moist in the plains, where there are hot summers, fine autumns, mild winters, and rainy springs. The mean annual temperature is 68° Fahr. On the plateau of Lannemezan, while the summers are dry and scorching, the winters are very severe. A meteorological observatory has been built on the Pic du Midi.

Of the total area of 1,119,292 acres 259,334 are arable, 214,782 under wood, 160,624 pastures and grazing-lands, 76,015 permanent meadows and orchards, and 39,135 vineyards. The mountain slopes are covered with pasture to a height of more than 6600 feet. In 1881 the live stock included 114,900 horned cattle (the milch cows of Lourdes and the oxen of Tarbes being the most esteemed), 18,000 horses (mostly of the Tarbes breed crossed with Arab blood), 11,830 asses, 3200 mules (part of which are bred for Spain), 222,300 sheep, 74,800 pigs, and 8718 goats. The more important cereals are successively, as the elevation increases, maize, wheat, and rye; in the mountain districts oats, barley, and buckwheat are grown. In 1882 the harvest yielded 158,620 quarters of wheat, 197,931 of maize, 70,690 of rye, 47,586 of oats, 15,069 of barley, 27,586 of buckwheat, 61,241 of meslin, and 1,793,104 bushels of potatoes. The formerly extensive forests have suffered considerably from the weather and other causes. Vines, trained upon trees as in Italy, yield on an average 2,464,000 gallons of wine annually. On the lower slopes chestnut trees and fruit trees take the place of the vines. There are various quarries of fine marbles, which are sawn and worked at Bagnères, and numerous slate quarries. The mines of iron, nickel, lead, cobalt, manganese, and zinc are worked only irregularly. There is no coal, but a few hundred tons of peat are annually extracted. The mineral waters of Hautes-Pyrénées are numerous and much resorted to. The principal in the valley of the Gave de Pau are Caunterets (twenty-four hot springs containing sulphur and sodium), St Sauveur (two springs with sulphur and sodium), and Barèges (twelve hot springs with sulphur and sodium), and in the valley of the Adour Bagnères (fifty-two hot or cold springs containing calcium sulphates, iron, and arsenic) and Capvern near Lannemezan (two springs containing calcium sulphates). There are 2 paper-mills employing 101 workmen, 28 spinning or weaving factories employing 908 workmen (4000 spindles and 750 looms, of which 220 are power-looms). The light woollen materials known under the name of "barèges" and the knitted work of the department are widely known beyond its limits. A company has been formed for establishing cheese-factories in the mountains, as in Switzerland. There are also saw-mills, flour-mills, tanneries, and at Tarbes very important artillery establishments and a bell-foundry.

The passes (*ports*) into Spain rise more than 6500 feet; none of them are accessible to carriages, and only three—Gavarnie, Ourdissetou, and Plan—to beasts of burden. Within the department there are 222 miles of Government roads, 2837 miles of other roads, and 129 miles of railroad. It is traversed from west to east by the line from Bayonne to Toulouse, which has branches from Lourdes to Pierrefitte for Caunterets, from Tarbes to Bagnères de Bigorre, and from Montrejeau to Bagnères de Luchon. It is crossed also by lines from Tarbes to Bordeaux and from Tarbes to Agen, which separate at Vic de Bigorre. The population in 1881 was 236,474. There are three arrondissements, those of Tarbes (chief town), Argelès (town, 1682 inhabitants), and Bagnères de Bigorre (7634 inhabitants), 26 cantons, 480 communes. Hautes-Pyrénées constitutes the diocese of Tarbes, and is attached to the superior court of Pau and to the 18th Army Corps (Bordeaux).

3. PYRÉNÉES-ORIENTALES, a department of southern France, bordering on the Mediterranean and the Spanish frontier, was formed in 1790 out of the old province of Roussillon and to some slight extent out of small portions of Languedoc. It lies between 42° 20' and 42° 56' N. lat. and 1° 43' and 3° 10' E. long., and is bounded on the N. by Ariège and Aude, on the E. by the Mediterranean, on the S. by Catalonia, and on the W. by Ariège. Its boundaries are almost all natural and on the north follow the line of the Corbières (from 2500 to 3000 feet high), on the north-west and south-west that of branches of the

Pyrenees (from 8000 to 10,000 feet), and on the south-east that of the Albères (from 4000 to 5000 feet), which end in the sea at Cape Cerbera. Deep and sheltered bays in this vicinity are succeeded farther north by flat sandy beaches, along which lie lagoons separated from the sea by belts of sand. The lagoon of St Nazaire is 5400 acres in extent, and that of Leucate on the borders of Aude is 20,000 acres. Mont Canigou (9137 feet), though not the highest mountain in the department, is the most remarkable, since it stands out to almost its full height above the plain, and exhibits with great distinctness the succession of zones of vegetation. From the base to a height of 1400 feet are found the orange, the aloe, the oleander, the pomegranate, and the olive; the vine grows to the height of 1800 feet; next come the chestnut (2625 feet), the rhododendron (from 4330 to 8330 feet), pine (6400), and birch (6560); while stunted junipers grow quite to the summit. The drainage of the department is shared by the Tet, Tech, and Agly, which flow direct into the Mediterranean. The Aude, the Ariège (an affluent of the Garonne), and the Sègre (an affluent of the Ebro) also take their rise within the department and include a small part of it in their respective basins. The Tet rises 9430 feet above the sea and descends rapidly into a very narrow valley before it debouches at Ille (between Prades and Perpignan) upon a large plain, where it flows over a wide pebbly bed and supplies numerous canals for irrigation. It is nowhere navigable, and its supply of water varies much with the seasons, all the more that it is not fed by any glacier. The Agly, which passes Rivesaltes (famous for its wines), rises in the Corbières, and serves almost exclusively for irrigation, though admitting of navigation in the lower part of its course. The Tech, which after the Tet is the most important river of the department, flows through Vallespir (*Vallis aspera*), which, notwithstanding its name, is a green valley, clothed with wood and alive with industry; in its course the river passes Prats de Mollo and Amélie-les-Bains, before reaching Arles and Céret. In the lowlands the climate is entirely that of the Mediterranean, and the productions are the same as those of Corsica or Sicily; Amélie-les-Bains is much frequented on account of its mild climate and sheltered position. The thermometer ranges from 85° to 95° Fahr. in summer, and in winter only occasionally falls as low as 26° or 27°. The average number of rainy days in the year is 70; the mean amount of the rainfall is 27 inches on the coast, but increases towards the hills. The most common wind is the "tramontane" from north-north-west, as violent as the mistral of Provence and extremely parching. The "marinada" blows from the south-south-east.

Of a total area of 1,018,632 acres 211,960 are arable, 172,980 under vines, 167,740 under wood, 193,867 pasture-land, 27,305 meadow-land, and 148,270 barren moors (*garrigues*). In 1881 the live stock numbered 7287 horses, 6261 asses, 4373 mules, 17,768 horned cattle, 121,016 sheep (125 tons of wool in 1878), 12,864 goats, 23,838 pigs, and fowls and game in abundance; there were also 6163 beehives, yielding 24 tons of wax and 19 tons of honey known as "miel de Narbonne." Thirty tons of cocoons (silk) were produced in the same year. The main source of wealth to the department is its wine, of which 48,840,000 gallons were produced in 1881; some kinds are strongly alcoholic and others are in request as liqueur wines (Rivesaltes, Banyuls). The harvest of 1881 yielded 26,551 quarters of wheat, 3793 of meslin, 37,930 of rye, 6896 of barley, 3448 of buckwheat, 34,480 of oats, 55,172 of maize, 1,655,168 bushels of potatoes, 67,448 of dried vegetables, 22,640 of chestnuts, 110,336 of beetroot, 39 tons of hemp, 39 of flax, and 23,000 of olives. Market-gardening (artichoke, asparagus, tomatoes, melons) and fruit culture (peaches, apricots, plums, pears, quinces, pomegranates, almonds, apples, cherries, walnuts, chestnuts) yield abundant returns. The woods produce timber for the cabinetmaker, cork, and bark for tanning. In iron Pyrénées-Orientales is one of the richest departments in France. The greater part of the ore is transported to Aveyron, Gard, or Allier, but 25,000 tons are smelted in blast-furnaces and 1800 in Catalonian forges within the depart-

ment. In 1881 12,100 tons of pig-iron were produced. The mineral resources of the department also include a bed of bismuth and mines of copper and silver, while both the Tet and the Tech are to some extent auriferous. A small amount of lignite is obtained (1639 tons), and various fine marbles are abundant. Granite, slate, gypsum, and limestone are quarried. The mineral waters are much resorted to. Amélie-les-Bains has twelve hot springs, chalybeate or sulphurous. In the arrondissement of Céret there are also the establishments of La-Preste-les-Bains, near Prats de Mollo, with hot sulphurous springs, and of Boulou, the Vichy of the Pyrenees. Near Prades are the hot sulphurous springs of Molitz, and a little north of Mont Canigou are the hot springs of Vernet, containing sodium and sulphur. In the valley of the Tet the sulphurous and alkaline springs of Olette reach a temperature of 172° Fahr. The baths of Escaldas near Montlouis are hot, sulphurous, and alkaline. There are numerous tanneries, oil-works, distilleries, and saw-mills, and the manufactures of the department include the making of corks, cigarette-paper, barrels, bricks, woollen and other cloths, and "espadrilles" (a kind of shoe made of coarse cloth with esparto soles). The ports of the department are Collioure, Port Vendres, and Banyuls, with 371 vessels and a total tonnage of 3638 in 1882. Port Vendres alone has any importance; in 1882 the ships entered numbered 380 (104,572 tons), those which cleared 368 (95,931 tons). There are 67 miles of railway, consisting of a portion of the line from Narbonne to Barcelona (Spain) by Perpignan, with its branches from Perpignan to Prades; there are 208 miles of Government roads and 2107 miles of other roads. The chief routes across the Pyrenees are from Perpignan and Montlouis to Puycerda (Puigcerda) in the Spanish province of Gerona, through the pass of La Perche, skirting in the French department an enclave of Spanish territory. Three other roads run from Perpignan to Figueiras (Figueras) through the passes of Perthus, Banyuls, and Balistres. In 1881 the population of Pyrénées-Orientales amounted to 208,855, the majority of whom were Catalans in speech and the rest Provençal. The chief towns of the three arrondissements are PERPIGNAN (*q.v.*), Céret (3104 inhabitants), and Prades (3687); there are 17 cantons and 231 communes. The department constitutes the diocese of Perpignan and is attached to the superior court and army corps of Montpellier. (4. ME.)

PYRITES (from $\pi\upsilon\rho$, fire), a name applied to the native bisulphide of iron, which occurs as a yellow metallic mineral, sufficiently hard to emit sparks when struck with either flint or steel. Nodules of pyrites are common in the lower beds of Chalk, and fragments of these nodules have occasionally been found on prehistoric sites under circumstances which suggest that the mineral was used as a fire-producing medium at a very early period of human culture. Even in late historic time it was often employed instead of flint, as in some of the old wheel-lock guns, whence it came to be known in France as "pierre d'arquebuse." It was afterwards found that pyrites might be made available as a source of sulphur, oil of vitriol, and other chemical products; and the mineral thus acquired such importance that in 1725 it was made the subject of a special treatise by Dr J. F. Henckel, of Freiberg in Saxony. In 1757 an English translation of this work appeared under the title of *Pyritologia; or a History of the Pyrites, the Principal Body in the Mineral Kingdom*.

By modern mineralogists the term "pyrites" has been extended to a number of metallic sulphides, and it is therefore now used rather as a group-name than as the specific designation of a mineral. Hence the typical pyrites is often distinguished as "iron pyrites," while other members of the group are known as "copper pyrites," "cobalt pyrites," "arsenical pyrites," &c. When, however, the term "pyrites" is used without any qualifying prefix it invariably denotes the original iron pyrites, a mineral which is often known to miners as "mundic," and to mineralogists as "pyrite," the final letter of the original word being omitted to bring the spelling into harmony with that of the names of many other minerals.

Iron pyrites, though containing nearly half its weight of iron, is of no importance as an ore of that metal; but the mineral is extensively worked for the sake of the sulphur which it contains, whence it is sometimes known as "sulphur ore." Large quantities of this ore have been worked in the vale of Avoca, in county Wicklow, Ireland. But by far the

most important variety of the mineral is a "cupreous iron pyrites," which for many years past has been wrought on an enormous scale in Spain and Portugal. This ore seems to be an intimate mixture of iron pyrites with a small quantity of copper pyrites, the proportion of metallic copper being generally less than 3 per cent. Notwithstanding the poorness of the ore, the copper is profitably extracted by wet processes. There is also present a small quantity of silver (20 to 35 dwt. per ton), with a trace of gold. The deposits of this cupreous pyrites are of enormous magnitude, and occur at the junction of porphyritic rocks with clay-slate of Devonian age. The principal Spanish mines are those of Rio Tinto, Tharsis, and Calañas in the province of Huelva; whilst the most important of the Portuguese mines is that of San Domingos in the province of Alemtejo. There is ample proof that some of these pyritic deposits were worked by the ancient Romans.

The quantity of cupreous and other iron pyrites imported into Great Britain during the year 1883—principally from Spain and Portugal, but partly from Norway and elsewhere—was 601,288 tons, of the declared value of £1,356,083. But this quantity had been exceeded in several previous years, notably in 1880 and 1877. The quantity of iron pyrites raised in the United Kingdom in 1883 amounted to 27,672 tons, of the value (at the mine) of £17,467.

PYRMONT. See WALDECK.

PYROMETER, an instrument for measuring high temperatures. As long ago as 1701, in a paper¹ published anonymously in the *Philosophical Transactions*, Newton gave the results of attempts to estimate the temperature of red-hot iron by noting the time it took to cool to an observed temperature, assuming what has since been called Newton's Law of Cooling. The numerical results are given in terms of the degrees of a linseed-oil thermometer constructed by Newton. Its zero was the temperature of melting ice and its second fixed point the normal temperature of the human body, denoted by 12°. About the same time Guillaume Amonton in Paris made somewhat similar attempts to determine the temperature of the red-hot end of an iron bar, using for reference a rudimentary air-thermometer—the first of its kind in which the variation of atmospheric pressure was allowed for. Since the middle of the last century the different methods and instruments suggested for measuring high temperatures have been very numerous,—in fact the variation of almost every physical property of substances which alter with change of temperature has been utilized for this purpose. Measurements of the increase of pressure produced in a quantity of gas while its volume remains constant or of the increase of volume at constant pressure, of the heat given out by a mass of metal in cooling to an observed temperature, of the expansion of a metal or graphite bar or of a mass of clay are those which have been most frequently employed; but, besides these, the change in the electrical resistance of a wire, the saturation-pressure of the steam of various liquids, the pressure of gas dissociated from various solids, the electromotive force of a thermo-electric couple, the density of the vapour of a liquid, the change of shape of a compound spiral of different metals, have been used,—even the alteration in the wave-length of a note of given pitch has been suggested as capable of being made use of for pyrometric purposes. For reasons which will be given below, the numerical results obtained by one or other of the numerous forms of the gas-thermometer have a more definitely intelligible value. The gas-thermometer

method and the calorimetric method were both employed by Pouillet for the accurate measurement of high temperatures before 1836.

§ 2. The indications obtained by any of the numerous methods which have been suggested are, as a rule, expressed in terms of Centigrade or Fahrenheit degrees. This assignment of numbers presupposes not only a definition of temperature by which the size of the degree is determined but also a physical law which gives the relation between the measured interval of temperature and the standard degree. The various definitions of the standard degree that might be employed will be found in the article HEAT, secs. 12, 24, 25, 30, 31, 32; and in sec. 35 of the same article the definition of the absolute thermodynamic scale of temperatures is given. In the same article (sec. 38) it is shown that the "absolute temperature" of a liquid in thermal equilibrium with its own vapour under a pressure p may be obtained from the formula

$$t = t_0 e^{\int_{p_0}^p \frac{(1-\sigma)dp}{J\rho\kappa}},$$

where ρ is the density of the vapour, $\rho\sigma$ that of the liquid, κ the latent heat per unit-mass of the vapour corresponding to the saturation-pressure p . The dynamical equivalent of heat is represented by J . We have therefore the complete theory of what may soon become a practical method of expressing temperatures in the thermodynamic scale. Sir W. Thomson, in the article mentioned (secs. 39-45), has described arrangements for measuring the pressure of the saturated vapours of various liquids which will give that measurement in a thoroughly satisfactory manner up to, at any rate, some 600° C. For the higher temperatures mercury is the liquid employed. There are, however, some experimental data still wanting before the formula quoted above can be applied to the numerical calculation of the temperature. These are (1) the density ρ of the saturated vapour corresponding to the series of pressures, and (2) the corresponding latent heat κ of vaporization. These constants have not yet been actually observed. Instruments such as those figured in the article cited can, however, be employed with convenience and accuracy as continuous intrinsic thermoscopes, whose indications can supply a numerical measure of temperature after an empirical graduation. When used thus they possess the enormous advantage that the pressure of the saturated vapour at a definite temperature is perfectly definite, so that a single observation of the pressure is all that is necessary to determine the temperature, and the instrument can be easily arranged, so that this observation is practically a very simple one. The pressure of mercury vapour has already been determined by Regnault for temperatures up to 550°. A thermoscopic method of pyrometry which is very similar to the above was suggested by Lamy.² He proposed to measure the pressure of carbonic-acid gas dissociated from calcium carbonate. There is experimental evidence to show that the pressure of the dissociated gas is definite at a definite temperature. The recombination of the dissociated gas with the solid is, however, a slow process, and the method has been pronounced by Weinhold³ to be practically unsatisfactory.

§ 3. *Gas Pyrometry. Measurement of High Temperatures by the Expansion of Air and other Gases and Vapours.*—Temperatures may be expressed in the absolute thermodynamic scale by the method of the gas-thermometer, which is available for practical purposes even at very high temperatures. It has been shown⁴ that the indications

¹ "Scala Graduum Caloris," in *Phil. Trans.*, xxii. p. 824.

² *Comptes Rendus*, lxi. p. 347.

³ "Pyrometrische Versuche," *Pogg. Ann.*, cxlix. p. 186.

⁴ See HEAT, secs. 46-47.

of a nitrogen or hydrogen gas-thermometer, whether it is arranged to show the increase of pressure at constant volume or the increase of volume at constant pressure, give for the temperature numerical results which are practically identical with the corresponding numbers on the absolute scale. It follows, therefore, that any two gas-thermometers, if similarly graduated, would give identical indications for the same temperature, no matter whether or not they are filled with the same kind of gas and whether or not the quantities of the gases are such that the pressure in the two thermometers is the same at any one temperature. This important property of gas-thermometers has been experimentally verified by Regnault¹ by direct comparison up to 350° C. of instruments filled with different gases and at different pressures. For these reasons the readings of a properly arranged gas-thermometer have justly come to be regarded as furnishing the standard of temperature, at any rate outside the limits of the freezing and boiling points, and indeed may now be regarded as the temperature standard for scientific purposes throughout the whole range. The Kew standards are calibrated mercury-in-glass thermometers whose fixed points are repeatedly redetermined. Such instruments will not agree exactly with the gas-thermometer except at the freezing-point and boiling-point. Comparisons have been made between various mercury-thermometers and air-thermometers by Regnault² and many others. The results obtained by different observers are not entirely concordant; but it is needless here to discuss them, for, whatever may be the divergence between the mercury and air thermometers in the freezing-point and boiling-point, the method of measuring higher temperatures by continuing the scale of a mercury-thermometer beyond those limits is altogether untrustworthy in consequence of the very wide divergence between different mercury-thermometers at the same temperature, amounting sometimes to 10° or more³ at a temperature of 300°. The air-thermometer readings must therefore be regarded as the standard at any rate for temperatures beyond the boiling-point.

The general principle employed in the use of the gas-thermometer is as follows. Let p_0 be the pressure of a mass of gas at 0° C., p_{100} the pressure of the same mass of gas at 100° C., the volume being the same, p_t the observed pressure of the same mass of gas at some unknown temperature t , the volume still remaining the same, then

$$\frac{p_t - p_0}{p_{100} - p_0} = \frac{t}{100} \dots \dots \dots (1).$$

We require, therefore, three observations of the pressure, two⁴ to graduate the instrument and the third to measure the temperature. If the thermometer has been filled with gas of a perfectly definite kind—e.g., properly dried and purified air, nitrogen, or hydrogen—and the containing vessel has been previously thoroughly dried, the value of p_{100} may be obtained from tables, since $p_{100} = p_0(1 + 100\alpha)$, where α is the tabulated coefficient of expansion of the gas at constant volume. It is practically impossible to keep the volume of the gas constant in consequence of the expansion of the envelope. A correction must be applied on this account, the value of which is derived from independent observations of the expansion of the material of the envelope. If the pressure of the gas be maintained constant, and the volumes v_0 , v_{100} , v_t be observed for the three temperatures t° , 100°, 0°, we have—

$$\frac{v_t - v_0}{v_{100} - v_0} = \frac{t}{100} \dots \dots \dots (2).$$

In like manner $v_{100} - v_0$ may be taken from a table of the coefficients of expansion of gases. The different methods which have been suggested for the employment of this property of gases to measure high temperatures are very numerous. We give details of a few of them.

(1) *The Constant-Pressure Method.*—The following is a very simple and practical plan of employing the method for obtaining a reading of the temperature. A glass or porcelain bulb, provided with a fine neck, is very carefully dried and filled with perfectly dry air; it is then exposed to the source of the heat whose temperature is to be investigated in such a manner that the point of the neck just projects from the furnace. When the equilibrium of temperature is reached, the neck is hermetically sealed by a blow-pipe or oxy-hydrogen flame, and the bulb is withdrawn and allowed to cool, and weighed. The neck is then immersed in water or mercury and the point broken off. In consequence of the previous expansion of the air the pressure in the interior is much less than the atmospheric pressure, and the liquid consequently enters the bulb. When so much has entered that the pressure is the same inside and out (the difficulty of the comparative opacity of the porcelain is not insurmountable), the end is closed by a small piece of wax, and the bulb removed and weighed, with the liquid it contains. The bulb is then completely filled with the liquid, and weighed a third time. The difference between the third and first weighings gives a value v_t of formula (2), which only requires correction for the expansion of the envelope, while the difference between the second and first weighings gives a value of the volume from which v_0 and v_{100} can be calculated, using the known coefficient of expansion of air, and thus all the requisite data for the determination of t are obtained. This method was used by Regnault⁵ to determine the coefficient of expansion of air, and has since been described as "a new pyrometer."

In the process just described the volume of the residual gas is measured; its pressure, after cooling, may be measured instead, by an arrangement which was suggested by Regnault. The bulb is provided with a long fine neck, to the end of which a tap is fitted and so arranged that it can be easily connected with a manometer. The bulb is exposed to the high temperature, the tap being left open, and when the final temperature is reached the tap is closed and the bulb allowed to cool; it is then connected with the manometer, and, if the tap be a three-way tap, drilled as shown in fig. 1, it is easy to expel all the air from the bulb side of the manometer, between the mercury surface and the tap. The residual pressure is then measured by the manometer. A correction is required for the expansion of

Fig. 1.

the bulb and for the part of the connecting tube not exposed to the high temperature. Instead of measuring the volume of the residual gas in the manner thus described, Deville and Troost⁶ have pumped the hot air out of the porcelain bulb by means of a Sprengel pump, and measured the volume of air delivered by the pump. On this plan a series of observations can be made at the same temperature, a three-way tube with suitable taps serving to put the bulb alternately in connexion with a vessel to supply dry air and with the pump. Crafts and Meier⁷ have obtained results by sweeping out the air with a current of hydrochloric-acid gas, which was separated from the air it carried by being passed through water.

An instrument for observing the continuous variation of volume of a gas at constant pressure is figured and described by Sir W. Thomson in *HEAT* (sec. 65). Arrangements have also been suggested by which the density⁸ of the gas at the high temperature can be directly measured. Regnault⁹ has described a hydrogen pyrometer based on this principle suitable for measuring the temperature of a porcelain furnace. A wrought-iron tube of known capacity is permanently fixed in the furnace; it is filled with pure dry hydrogen by passing a current of the gas through it for some time. The current of gas is then stopped, and after the gas has attained the temperature of the furnace it is swept out by a current of dry air and passed over red-hot copper oxide. The water thus

¹ "De la Mesure des Températures," *Mém. de l'Inst.*, xxi. p. 168.

² *Mém. de l'Inst.*, xxi. p. 191.

³ See *HEAT*, sec. 26.

⁴ The two known temperatures at which the pressure is measured need not necessarily be 0° and 100°, though these are often the most convenient. The formula requires only slight modification to make it applicable when any two other known temperatures are adopted.

⁵ *Mém. de l'Inst.*, xxi.

⁶ *Comptes Rendus*, xc. 727, 773.

⁷ *C. R.*, xc. 606.

⁸ Throughout this article the term "density" is used whenever the mass of a unit of volume of a substance is referred to.

⁹ *Ann. de Chim.*, [3], lixiii. p. 39.

formed is collected in sulphuric acid tubes and its amount determined by their increase in weight, and from this observation the density of the hydrogen in the wrought-iron tube is calculated. An arrangement of taps makes the observation a very easy one when the apparatus is once set up. The formula (2) requires in this case to be slightly modified. Thus let d_t , d_{100} , d_0 be the densities of the hydrogen at the temperatures t° , 100° , and 0° respectively, then for the same mass of gas m we have—

$$v_t d_t = v_{100} d_{100} = v_0 d_0 = m.$$

The formula therefore becomes—

$$\frac{d_0 - d_t}{d_0 - d_{100}} \cdot \frac{d_{100}}{d_t} = \frac{t}{100} \dots \dots \dots (3).$$

(2) The formula shows how the temperature of air in any experiment may be determined when its density at that temperature is observed. It is sometimes more convenient to determine instead the density of some vapour which at ordinary temperatures would be a solid or a liquid, and to deduce from that observation the density of air at the corresponding temperature. Thus, suppose that the density δ_t (expressed in grammes per cc.) of the vapour of any given liquid or solid is observed, and that independent observations show that the specific gravity of the vapour, referred to air at the same temperature and pressure, is σ , then we have $d_t = \delta_t / \sigma$, and, since d_0 and d_{100} can be taken from tables, all the necessary quantities in equation (3) are obtained. It will be noticed that the value of σ , the specific gravity of the vapour, is to be derived from independent observations. Apart from direct experimental evidence in any particular case, there is the generally accepted theory, based on the law of Avogadro, that the specific gravity of a gas or vapour referred to hydrogen at the same temperature and pressure is represented by half the number expressing the molecular weight of the substance of which the vapour is composed. For elements, with few exceptions (of which mercury is one), the ratio of the atomic weights gives the specific gravity referred to hydrogen at the same temperature and pressure. At any rate, if there are sufficient data for us to regard σ as known, we may evidently deduce the value of d_t , and thus by formula (3) the temperature, from an observation of δ_t .

Mercury Vapour.—Regnault¹ suggested the direct observation of the density of mercury vapour for the purpose of determining the temperature. The process is as follows. A quantity of mercury is placed in a wrought-iron flask provided with a perforated lid as shown in fig. 2, No. 1. The flask is then exposed to the temperature to be measured, and when thermal equilibrium is attained the small lid is slid along so that the neck is closed. The flask is then taken out and allowed to cool. The mercury is collected and weighed; the volume of the flask is determined and corrected for the expansion of the iron; and these two observations determine the density of mercury (in grammes per cc.) at the temperature in question. The specific gravity² of mercury vapour referred to air at the same temperature and pressure is known to be 6.92. A porcelain flask with a ball stopper, shown in fig. 2, No. 2, may be used instead of the iron flask.

Fig. 2.

Iodine Vapour. Deville and Troost's Pyrometer.—Some of the best-known determinations of very high boiling-points have been made by Deville and Troost,³ who employed iodine in a manner similar to that in which Regnault employed mercury. Some iodine was contained in a porcelain flask of about 300 cc. capacity, with a fine neck, which just protruded from the source of heat and was loosely closed by means of a stopper; when the temperature was reached and the iodine completely volatilized, the stopper was fused on to the nozzle by means of an oxy-hydrogen blowpipe. The mass of the iodine remaining in the flask was determined by weighing, after it had cooled; the volume of the flask had been previously determined; thus the density of the iodine vapour could be found. A correction of the volume of the flask was necessary in consequence of the expansion of the Bayeux porcelain of which it was composed. This was obtained from independent observations of the linear elongation of a rod of porcelain for temperatures up to 1500° ; their results gave a coefficient of cubical expansion of 0.0000108 between 0° and the boiling-point of cadmium (856°), 0.0000108 between 0° and the melting-point of silver (1000°), from 0.000016 to 0.000017 between 1000° and 1400° , reaching 0.00020 towards 1500° . The specific gravity of iodine vapour was taken to be 8.716, referred to air at the same temperature and pressure; this assumption was justified by additional observations with air and by using the number in a determination of the density of steam at the boiling-point of mercury.

(3) **The Manometric Gas-thermometer.**—In the constant-pressure methods of measuring temperature which have just been described one experiment gives only a single observation of the temperature.

The continuous variation of temperature can be better observed by the constant-volume method. This method as used for temperatures up to that at which glass softens (about 550° C.) was thoroughly investigated by Regnault,⁴ whose normal instrument is discussed under HEAT, sec. 24. The difference of pressure between the gas contained in the bulb and the atmosphere is measured by an open mercury-manometer. The barometric pressure must also be observed in order to obtain the values p_t , p_{100} , and p_0 respectively of formula (1). Various forms have been given to the manometric apparatus in order that the mercury may be brought at each observation to the fiducial mark in the limb in connexion with the bulb. Balfour Stewart's⁵ has a screw adjustment. An instrument described by Codazza⁶ is provided with an air-compression manometer, and thus the necessity of a separate observation of the barometric height is dispensed with. Various other suggestions have been made for securing the same object.

The most convenient form of the instrument for general use is Jolly's (described in Poggendorff's *Jahrbuch*, p. 82, 1874), and represented in fig. 3. The two vertical tubes of the manometer are connected by an india-rubber tube properly strengthened by a cotton covering, and they can be made to slide vertically up and down a wooden pillar which supports them; they are provided with clamps for fixing them in any position and a tangent screw for fine adjustment. The connexion between the bulb and the manometer is made by means of the convenient three-way tap described above. The scale of the instrument is engraved on the back of a strip of plane mirror before silvering, and the divisions are carried sufficiently far across the scale for the reflexions of the two surfaces of the mercury to be visible behind the scale. Parallax can thus be avoided and an accurate reading obtained without the necessity of using a kathetometer. In order to allow for the expansion of the glass of the reservoir a weight-thermometer bulb is supplied with the instrument, made from another specimen of the same kind of glass, and the relative expansion of the mercury and the glass can thus be determined by the observer himself. The volume of the air-bulb and that of the capillary tube and the small portion of the manometer tube above the small beak of glass, the point of which serves as the fiducial mark, are determined by the instrument-makers. The formula of reduction is—

$$t = \frac{H - H_0}{\alpha H_0 - 3\beta H} \left(1 + \frac{v'}{v} \cdot \frac{H}{H_0} \cdot \frac{1}{1 + \alpha t'} \right),$$

where H is the pressure at the high temperature t , H_0 the pressure at the temperature of the air t' , v'/v the ratio of the volume of the connecting tube, &c., to the volume of the bulb, α the coefficient of expansion of the air, and 3β the coefficient of cubical expansion of the glass. A similar instrument with a bulb which will resist higher temperatures may be used beyond the softening-point of glass. Pouillet in his classical research on high temperatures⁷ used a platinum bulb and connecting tube. He employed the constant-pressure method and measured in the manometer tube the variation of volume. Regnault⁸ mentions a platinum air-pyrometer and gives instructions for drawing the platinum connecting tube; but no results of measurements obtained with it are given. E. Becquerel⁹ published an account of results obtained with a platinum reservoir air-thermometer, which were objected to by Deville and Troost on the ground that platinum becomes porous at high temperatures, and their objection is supported by an experiment described by them in the *Répertoire de Chimie Appliquée*, 1863, p. 237, and *Fortschritte der Physik*, 1863, p. 84. Weinhold¹⁰ used a Jolly's thermometer fitted with a porcelain bulb and connecting tube, and Deville and Troost are of opinion that porcelain forms the only suitable material for gas-thermometer bulbs for very high temperatures.¹¹ For use at high temperatures the gas-thermometer should be filled with gas at a low pressure, so that when heated there may be no great difference of pressure between the interior and the external air. It is perhaps unnecessary here to insist upon the necessity for the complete desiccation of the interior of the bulb and of the gas employed.

(4) The last modification of the gas-thermometer to which it is necessary to call attention is that designed and used by Berthelot,¹² intended for reading high temperatures rapidly to an accuracy of within two or three degrees. It consists of a small cylindrical bulb

of glass or silver of 4 cc. capacity connected with a vertical stem of thermometer tubing of 0.2 mm. diameter. This stem terminates in an open vessel of mercury, and thus the pressure of the gas can be measured. Berthelot's instrument is graduated by reference to four fixed points, namely, the freezing-point and boiling-point of water, and the boiling-points of mercury and sulphur. In order that the mercury index may move easily in the tube, extreme care must be taken in drying the tube, and only perfectly pure mercury can be used.

§ 4. The results obtained by any of the air-pyrometric methods just described may be employed to express directly the temperature of the pyrometer in numbers agreeing closely with the thermodynamic scale. The other instruments to which we now turn our attention can only be regarded as intrinsic thermoscopes, which, in order to give intelligible numerical results, must be graduated by direct comparison with an air-thermometer. Some of them may indeed be used by extrapolation to give a numerical measure of temperatures outside the practical range of the air-thermometer, employing for that purpose a formula verified for temperatures within the range. A case in point is the determination of the temperature of fusion of platinum by the calorimetric method described below. These intrinsic thermoscopes are frequently much more convenient in practice than any of the modifications of the air-pyrometer.

§ 5. *Discontinuous Intrinsic Thermoscopes.*—The best example of the measurement of temperature by a discontinuous intrinsic thermoscope is that suggested by Prinsep.¹ He formed a series of definite percentage alloys of silver and gold and of gold and platinum. The melting-points of these alloys give a series of fixed temperatures lying between the melting-points of silver and gold and of gold and platinum respectively. An observation is taken by exposing in the furnace, upon a small cupel, a set of small flattened specimens of the alloys, not necessarily larger than pin heads, and noticing which of them are fused.

The temperatures of fusion of these alloys have been determined by Erhard and Shertel²; their results are given in the following table, taken from Landolt and Börnstein's *Physikalisch-chemische Tabellen*.

Table I.—The Fusing-Points of Prinsep's Alloys.

1. SILVER AND GOLD.					
Per cent. of silver.	Per cent. of gold.	Fusing-point. ³	Per cent. of silver.	Per cent. of gold.	Fusing-point.
100	..	954°	40	60	1020°
80	20	975°	20	80	1045°
60	40	995°	..	100	1075°
2. GOLD AND PLATINUM.					
Per cent. of gold.	Per cent. of platinum.	Fusing-point. ³	Per cent. of gold.	Per cent. of platinum.	Fusing-point.
100	..	1075°	45	55	1420°
95	5	1100°	40	60	1460°
90	10	1130°	35	65	1495°
85	15	1160°	30	70	1535°
80	20	1190°	25	75	1570°
75	25	1220°	20	80	1610°
70	30	1255°	15	85	1650°
65	35	1285°	10	90	1690°
60	40	1320°	5	95	1730°
55	45	1350°	..	100	1775°
50	50	1385°			

It is said, however, that some difficulty is met with in the use of Prinsep's alloys in consequence of the property possessed by silver of taking up oxygen when melted and ejecting it on solidifying and of molecular changes in the alloys which make it unadvisable to use the same specimen more than once. A similar method has recently been employed by Carnelley and Carleton Williams,⁴ in which metallic salts with high fusing-points were employed instead of alloys, the fusing-points being initially determined by a calorimetric method. These methods recall an old empirical method sometimes employed in porcelain manufacture for estimating the

temperature of a furnace. Certain "pyrometrical beads" or "trials"—i.e., small hoops or gallipots of clay—indicated the temperature by their tint much in the same way as the proper temperature is indicated by the colour of steel in tempering.

§ 6. *The Calorimetric Method.*—This is a very convenient method and is often practically employed for measuring the temperature of furnaces. The observation consists in determining the amount of heat given out by a mass of platinum, copper, or wrought-iron on cooling in water from the high temperature. The theory is simple. Let m be the capacity for heat of the calorimeter and of the water contained in it, M the mass of metal, T the temperature required, t the initial temperature of the water in the calorimeter, θ the final temperature of the water after the introduction of the metal, and κ the mean specific heat of the metal between the temperatures θ and T . Then

$$T - \theta = \frac{m(\theta - t)}{M \cdot \kappa}.$$

The value of κ , the mean specific heat of the metal between the temperatures occurring in the experiment, must be determined by precisely similar calorimetric experiments, in which the high temperature T is determined by the application of one of the air-pyrometer methods. The following table (II.) gives the best-known determinations of the mean specific heat of platinum for different ranges of temperature.

Table II.—Mean Specific Heat of Platinum.

Pouillet, ⁵ by platinum reservoir air-thermo- meter.		Weinhold, ⁶ by porcelain reservoir air-thermo- meter.		Vielle, ⁷ by porcelain reservoir air-thermo- meter.

„ 800°	0.03644	20°–7 –705°	0.03333		
„ 900°	0.03686	28°–6 –766°	0.03381		
„ 1000°	0.03728	22°–3 –934°	0.03396	0°–1000°	0.0377
„ 1100°	0.03770	17°–3 –952°	0.03338	0°–1177°	0.0388

Vielle's results give, if c_0 be the mean specific heat between 0° and t , $c_0 = 0.0317 + 0.000006t$. Assuming this formula to hold beyond the verified limits, he obtains by calorimetric observations 1779° C. as the temperature of the melting-point of platinum. The true specific heat of wrought-iron at temperature t is according to Weinhold (*l.c.*) given by the formula $c_t = c_0 + at + \beta t^2$, where $c_0 = 0.105907$, $\alpha = 0.00006538$, $\beta = 0.00000066477$, and the total heat obtained from unit-mass of wrought-iron cooling from t_2 to t_1 is therefore $\int_{t_1}^{t_2} (c_0 + at + \beta t^2) dt$. The specific heat of copper does not appear to have been accurately determined for high temperatures. The determinations by Bède, quoted by Landolt and Börnstein (*op. cit.*, p. 178) are—

15°–100° mean specific heat	0.09331;
16°–172° "	0.09483;
17°–247° "	0.09680.

There are two obvious sources of error of considerable amount in the use of the calorimeter for pyrometrical purposes, viz., (1) the liability of the metal to lose heat during its passage from the furnace to the calorimeter, and (2) the evaporation of water from the calorimeter. With the small mass of platinum generally used, the former source of error is likely to be very important, for the temperature of a mass of 50 grammes of mercury at 100° C. may fall a full degree in being carried to a calorimeter 3 feet away. It does not appear that any estimates of the amount of loss which may be so produced in calorimetric determinations have been published; but in order to reduce the loss Salleron⁸ suggests the employment of a platinum or copper carrier in which to heat the mass of metal, and J. C. Hoadly⁹ uses a graphite crucible for that purpose. The second source of loss is more easily disposed of. Weinhold (*l.c.*) uses a calorimeter closed by a lid and quite filled with water. This is provided with a broad tube passing nearly to the bottom of the calorimeter, and the latter is tilted while the platinum mass is being introduced; whereas Vielle¹⁰ gets over the same difficulty by the use of a calorimeter provided with a platinum "éprouvette," so that the heat is imparted more slowly to the water. In a calorimetric pyrometer for technical purposes, made by Messrs Siemens

Brothers, the mass of metal employed is a copper cylinder. For a sketch and description of the instrument, see IRON, vol. xiii. p. 304 (fig. 21).

§ 7. *Continuous Intrinsic Thermoscopes.*—The other pyrometric methods to which we have space to refer are those which depend on the continuous variation of some property of a body with variation of temperature. Each instrument of this kind requires graduation by direct or indirect comparison with an air-thermometer. The methods may be grouped under three heads,—(1) the expansion of a rod of metal or earthenware; (2) the variation of electrical resistance of a wire; (3) the electromotive force of a thermoelectric junction.

(1) *Expansion of Metals and Earthenware.*—The necessity for the measurement of high temperatures has been most felt perhaps in pottery manufacture, and in consequence many attempts have been made by potters to establish a system of pyrometry based on the permanent contraction which clay undergoes when exposed to a high temperature. The action of Wedgwood's pyrometer described in the *Phil. Trans.*, 1782, 1784, and 1786, depends on this property of clay. The linear contraction of a clay cylinder was measured by means of a metal groove with plane sides inclined to each other at a small angle, and the temperature was estimated numerically by comparing the contraction with that produced by a known difference of temperature. The results were not very satisfactory, since the clay would contract the same amount by long-continued heating at a lower temperature as by a short exposure to a higher one. Wedgwood's estimate of the melting-point of cast iron was 20,577° Fahr.

The measurement of temperature by the expansion of a metal rod has been very frequently attempted. The first instrument to which the name of "pyrometer" was given was of this kind, and was devised by Muschenbroek, and others were devised in the early part of the century by Des Aguliers, Ellicot, Graham, Smeaton, Ferguson, Brogniart, Laplace, and Lavoisier, and later by Pouillet. We may say here that the only accurate methods of measuring the extremely minute elongations of metal rods are those in which the expansion is referred by some optical arrangement to a scale kept quite uninfluenced by the source of heat which causes the expansion. In this respect Pouillet's method of employing the expansion of a rod is superior to those previously employed.

The relative expansion of a metal in an earthenware socket was employed by Daniell in his well-known pyrometer. The relative expansion was indicated by an index of porcelain which was pushed forward when the bar expanded and left behind when it contracted, so that after the apparatus had cooled the expansion could be measured at leisure by the scale provided; due allowance was made for the expansion of the index itself. Quite recently the expansion of graphite has been employed for pyrometry by Steinhilber and Harting.¹ As the result of his experience, however, Weinhold² states that it is not possible to obtain trustworthy measurements of temperature from an instrument depending on the relative expansion of solid bodies.

An ingenious application of the relative expansion of gold, silver, and platinum was introduced by Bréguet. Very narrow strips of the three metals are fastened together to form a compound ribbon-spiral, and to the end of the spiral is attached a needle, which, as the temperature changes, moves over a graduated circle. The instrument, of course, requires empirical graduation. A modification of it is sometimes used to measure the temperature of the hot blast of an iron furnace.

(2) *Variation of Electrical Resistance.*—A pyrometric method founded on the variation of the electrical resistance of a platinum wire has been practically carried out by Siemens, and was described by him in the Bakerian lecture (*Proc. Roy. Soc.*, 1871). "Assuming a dynamical law, according to which the electrical resistance increases according to the velocity with which the atoms are moved by heat, a parabolic ratio of increase of resistance with increase of temperature follows, and in adding to this the coefficients (representing linear expansion and an ultimate minimum resistance) the resistance r for any temperature is expressed by the general formula $r = \alpha T^2 + \beta T + \gamma$, which is found to agree very closely both with the experimental data at low temperatures supplied by Dr Matthiessen and with the experimental results varying up to 1000° C." The details of the experimental verification are not given in the abstract of the lecture, nor are the numerical values of the constants for platinum. But Weinhold gives the information, obtained by letter from the lecturer, that T is the absolute temperature, $\alpha = 0.039369$, $\beta = 0.00216407$, $\gamma = -0.24127$.

The experimental arrangement for practical purposes of the in-

strument as supplied by Messrs Siemens Brothers is exceedingly convenient. It is shown in fig. 4. P is the coil of platinum-wire wound on a cylinder of fireclay, and connected by stout platinum wires X , X' , C with three binding screws at the end of a stout iron tube 6 feet long, and thereby with an arrangement for comparing its resistance with that of a standard coil X , by means of differential voltmeters V , V' . A current from six Leclanché cells is divided into two parts, one going through the standard coil X , the voltmeter V , and an additional platinum wire, also marked X , joining the other branch again at the end of the platinum coil, while the other branch includes the voltmeter V' , the connecting wire X' , and the coil P . The wire C is common to both circuits.

Fig. 4.

The amount of gas generated in the voltmeters is inversely proportional to the resistances of the respective branch circuits. Thus, if V and V' be the volumes of gas in the two voltmeters respectively,

$$\frac{V}{V'} = \frac{\text{Resistance of } P \text{ and its connexions}}{\text{Resistance of } X \text{ and its connexions}}$$

The leading wires from the screws of the iron tube to the commutator BBC are bound together in one cable, so that they have the same resistance; thus the observed variation in the ratio of the resistances may be regarded as entirely due to the variation in the resistance of P . The height of the liquids in the two voltmeters can be adjusted by the short glass tubes S , S' sliding vertically on the wooden support to which the voltmeters are attached. They are connected by means of india-rubber tubing with the voltmeters. The commutator BBC is used to reverse the direction of the current every ten seconds during the observation, which lasts long enough to give a sufficient supply of gas in the voltmeter tubes. By this artifice the error due to variation in the polarization of the electrodes is avoided.

The voltametric arrangement for comparing the resistances simplifies very greatly the apparatus required. In a laboratory the resistances may be, of course, more accurately compared by means of resistance-coils and a galvanometer. For technical purposes the temperatures up to 1400° are reduced from the observations by means of a very convenient slide rule. For temperatures beyond 1400° the calculation has to be gone through. The experimental data upon which the verification of the formula and the determination of the constants rest are not very numerous. Besides the measurements of Siemens referred to above, there is an experimental comparison by Weinhold of the results obtained from the instrument and those of an air-thermometer. For these observations the iron cover of the coil was removed. The results up to 500°, which in each case are the mean of from five to ten observations, show an agreement within 9°; those between 500° and 1000°, comprising one observation at each of six temperatures, three of these between 531° and 553° and three between 933° and 992°, show differences of about +26° at the lower limit and -53° at the upper. The arrangement for comparing the resistances was found to be satisfactory and sufficiently sensitive. Specimens of this instrument were also submitted to experiment by a committee of the British Association (*Report*, 1874), but their attention was confined to the resolution of the question whether the platinum coil gave the same resistance after being repeatedly heated and cooled. It was found that

¹ See Beckert, *Zeitschr. f. anal. Chem.*, xxi. p. 248, 1882.

² *Pogg. Ann.*, cxlix. p. 206.

this was not the case unless the coil was carefully protected by a platinum sheath.

(3) *Thermo-electric Methods*.—The measurement of high temperatures by means of a thermo-electric junction has been attempted many times. A platinum-iron element was employed by Rosetti to measure the temperature of flames.¹ E. Becquerel² used a platinum-palladium element. The best-known results on the variation of the electro-motive force with temperature are those of Tait,³ in the *Edin. Phil. Trans.*, xxvii.; but full details of the measurement of temperature in his experiments are not given. It would appear, however, from Regnault's observations,⁴ and from the well-known effect of slight differences in the physical state or composition of the metals used, that it is in every case necessary for the observer with a thermo-junction to conduct his own comparison with an air-thermometer or other standard method.

§ 8. The application of the variation in the wave-length of sound to the measurement of the density of air and consequent determination of the temperature has been suggested by Cagnard de Latour, Damon-Ferrand, Mayer, and Chautard. The method is liable to difficulties which need not be detailed here, but which are obviously sufficient to cause the experiments to be regarded rather as scientific curiosities than as pyrometric measurements.

§ 9. Hitherto we have confined our attention to the question whether any instrument described is capable of giving trustworthy indications of the temperature of the instrument itself; in order to be satisfied as to whether they fulfil their object, we have still to consider whether they can be easily made to take up the temperature of the body or enclosure under investigation. This is a very difficult question, and it seems doubtful whether with such an instrument as Siemens's electrical pyrometer, of which the coil is contained in a massive sheath of iron connected to about 6 feet of stout iron tube, thermal equilibrium between the coil and the enclosure is possible. We have not space to discuss the matter, but it seems not unlikely that the differences which still exist between the results of different observers may be due to the method of exposure of the pyrometer. In connexion with this the researches of Regnault⁵ with reference to the determination of the boiling-point of mercury and sulphur are very important. He observed that his thermometers, when exposed directly to the steam, indicated too high a temperature, and that it was therefore necessary for the socket enclosing the thermometer to dip into the liquid to such an extent that the surface of the liquid was above the level of the top of the thermometer bulb. Whether or not this may account for some of the differences between the results obtained for the boiling-point of zinc by Deville and Troost and by E. Becquerel and Violle it is difficult to say.

The following table (III.) will show the divergence among the best of the high-temperature measurements.

Table III.—*Determinations of the Boiling-Point of Zinc.*

§ 10. Perhaps the most important modern attempts at the development of pyrometry are those connected with the identification of the law connecting the temperature of a body with the amount and nature of the energy which

it radiates. On such attempts depends the possibility of measuring the temperature of a hot body by means of the light it emits. This is evidently a most desirable object, since, if that were possible, one of the great difficulties of pyrometry—the bringing of the measuring instrument to the temperature of the body under investigation—would immediately disappear. At present, however, there is no general agreement among scientific men as to the form the relation takes. We cannot here do more than refer to the "Report on Spectrum Analysis," in the British Association's *Reports* for 1881 and 1884, for references to the literature of the subject. See RADIATION. (W. N. S.)

PYROTECHNY is the art of producing pleasing scenic effects by means of fire. It is not held to include the manufacture of inflammable and explosive substances for other purposes. The use of fireworks for purposes of display is not a modern invention, for it appears to have existed in China in very ancient times; but the secret of constructing them remained unknown in Europe till about the 13th century, when the knowledge of GUNPOWDER (*q.v.*) crept in from the East. In modern times the art has been gradually improved by the work of specialists, who have had the advantage of being guided by scientific knowledge. The value of such knowledge to the pyrotechnist is extremely great; for he must be governed by the principles of chemistry in the selection of his materials, and his various contrivances for turning them to the best account are subject to the laws of mechanics. As in all such cases, however, science is useless without the aid of practical experience and acquired manual dexterity.

Many substances have a strong tendency to combine with oxygen, and will do so, in certain circumstances, so energetically as to render the products of the combination (which may be solid matter or gas) intensely hot and luminous. This is the general cause of the phenomenon known as fire. Its special character depends chiefly on the nature of the substances burned and on the manner in which the oxygen is supplied to them. As is well known, our atmosphere contains oxygen gas diluted with about four times its volume of nitrogen; and it is this oxygen which supports the combustion of our coal and candles. But it is not often that the pyrotechnist depends wholly upon atmospheric oxygen for his purposes; for the phenomena of combustion in it are too familiar, and too little capable of variation, to strike with wonder. Two cases, however, where he does so may be instanced, viz., the burning of magnesium powder and of lycopodium, both of which are used for the imitation of lightning in theatres. Nor does the pyrotechnist resort much to the use of pure oxygen, although very brilliant effects may be produced by burning various substances in glass jars filled with the gas. Indeed, the art could never have existed in anything like its present form had not certain solid substances become known which, containing oxygen in combination with other elements, are capable of being made to evolve large volumes of it at the moment it is required. The best examples of these solid *oxidizing agents* are nitrate of potash (nitre or saltpetre) and chlorate of potash; and these are of the first importance in the manufacture of fireworks. If a portion of one of these salts be thoroughly powdered and mixed with the correct quantity of some suitable combustible body, also reduced to powder, the resulting mixture is capable of burning with more or less energy without any aid from atmospheric oxygen, since each small piece of fuel is in close juxtaposition to an available and sufficient store of the gas. All that is required is that the liberation of the oxygen from the solid particles which contain it shall be started by the application of heat from without, and the action then goes on unaided. This, then, is the funda-

¹ *Ann. de Chim.*, 1878.

² *Ann. de Chim.*, lxviii. p. 49.

⁴ *Mém. de l'Inst.*, xxi. p. 241.

³ See ELECTRICITY.

⁵ *Mém. de l'Inst.*, xxvi. p. 513.

mental fact of pyrotechny,—that, with proper attention to the chemical nature of the substances employed, solid mixtures (*compositions* or *fuses*) may be prepared which contain within themselves all that is essential for the production of fire.

If nitre and chlorate of potash, with other salts of nitric and chloric acids and a few similar compounds, be grouped together as oxidizing agents, most of the other materials used in making firework compositions may be classed as *oxidizable substances*. Every composition must contain at least one sample of each class: usually there are present more than one oxidizable substance, and very often more than one oxidizing agent. In all cases the proportions by weight which the ingredients of a mixture bear to one another is a matter of much importance, for it greatly affects the manner and rate of combustion. The most important oxidizable substances employed are charcoal and sulphur. These two, it is well known, when properly mixed in certain proportions with the oxidizing agent nitre, constitute gunpowder; and gunpowder plays an important part in the construction of most fireworks. It is sometimes employed alone, when a strong explosion is required; but more commonly it is mixed with one or more of its own ingredients and with other matters. In addition to charcoal and sulphur, the following oxidizable substances are more or less employed:—many compounds of carbon, such as sugar, starch, resins, &c.; certain metallic compounds of sulphur, such as the sulphides of arsenic and antimony; a few of the metals themselves, such as iron, zinc, magnesium, antimony, copper. Of these metals iron (cast-iron and steel) is more used than any of the others. They are all employed in the form of powder or small filings. They do not contribute much to the burning power of the composition; but when it is ignited they become intensely heated and are discharged into the air, where they oxidize more or less completely and cause brilliant sparks and scintillations.

Sand, sulphate of potash, calomel, and some other substances, which neither combine with oxygen nor supply it, are sometimes employed as ingredients of the compositions in order to influence the character of the fire. This may be modified in many ways. Thus the rate of combustion may be altered so as to give anything from an instantaneous explosion to a slow fire lasting many minutes. The flame may be clear, smoky, or charged with glowing sparks. But the most important characteristic of a fire—one to which great attention is paid by pyrotechnists—is its *colour*, which may be varied through the different shades and combinations of yellow, red, green, and blue. These colours are imparted to the flame by the presence in it of the heated vapours of certain metals, of which the following are the most important:—sodium, which gives a yellow colour; calcium, red; strontium, crimson; barium, green; copper, green or blue, according to circumstances. Suitable salts of these metals are much used as ingredients of fire mixtures; and they are decomposed and volatilized during the process of combustion.

Very often the chlorates and nitrates are employed, as they serve the double purpose of supplying oxygen and of imparting colour to the flame.

The number of fire mixtures actually employed is very great; for the requirements of each variety of firework, and of almost each size of each variety, are different. Moreover, every pyrotechnist has his own taste in the matter of compositions. They are capable, however, of being classified according to the nature of the work to which they are suited. Thus there are rocket-fuses, gerbe-fuses, squib-fuses, star-compositions, &c.; and, in addition, there are a few which are essential in the construction of most fireworks, whatever the main composition may be.

Such are the *starting-powder*, which first catches the fire, the *bursting-powder*, which causes the final explosion, and the *quick-match* (cotton-wick, dried after being saturated with a paste of gunpowder and starch), employed for connecting parts of the more complicated works and carrying the fire from one to another. Of the general nature of fuses an idea may be had from the following two examples, which are selected at hazard from among the numerous recipes for making, respectively, tourbillion fire and green stars:—

<i>Tourbillion.</i>		<i>Green Stars.</i>	
Meal gunpowder	24 parts.	Chlorate of potash	16 parts.
Nitre	10 "	Nitrate of baryta	48 "
Sulphur	7 "	Sulphur	12 "
Charcoal	4 "	Charcoal	1 "
Steel filings	8 "	Shellac	5 "
		Calomel	8 "
		Sulphide of copper	2 "

Although the making of compositions is of the first importance, it is not the only operation with which the pyrotechnist has to do; for the construction of the *cases* in which they are to be packed, and the actual processes of packing and finishing, require much care and dexterity. These cases are made of paper or pasteboard, and are generally of a cylindrical shape. In size they vary greatly, according to the effect which it is desired to produce. The relations of length to thickness, of internal to external diameter, and of these to the size of the openings for discharge, are matters of extreme importance, and must always be attended to with almost mathematical exactness and considered in connexion with the nature of the composition which is to be used.

There is one very important property of fireworks that is due more to the mechanical structure of the cases and the manner in which they are filled than to the precise chemical character of the composition, *i.e.*, their power of *motion*. Some are so constructed that the piece is kept at rest and the only motion possible is that of the flame and sparks which escape during combustion from the mouth of the case. Others, also fixed, contain, alternately with layers of some more ordinary composition, balls or blocks of a special mixture cemented by some kind of varnish; and these *stars*, as they are called, shot into the air, one by one, like bullets from a gun, blaze and burst there with striking effect. But in many instances motion is imparted to the firework as a whole,—to the case as well as to its contents. This motion, various as it is in detail, is almost entirely one of two kinds,—*rotatory*, motion round a fixed point, which may be the centre of gravity of a single piece or that of a whole system of pieces, and *free ascending* motion through the air. In all cases the cause of motion is the same, *viz.*, that large quantities of gaseous matter are formed by the combustion, that these can escape only at certain apertures, and that a backward pressure is necessarily exerted at the point opposite to them. When a large gun is discharged, it recoils a few feet. Movable fireworks may be regarded as very light guns loaded with heavy charges; and in them the recoil is therefore so much greater as to be the most noticeable feature of the discharge; and it only requires proper contrivances to make the piece fly through the air like a sky-rocket or revolve round a central axis like a Catherine wheel. Beauty of motion is hardly less important in pyrotechny than brilliancy of fire and variety of colour.

The following is a brief description of some of the forms of firework most employed:—

Fixed Fires.—*Theatre fires* consist of a slow composition which may be heaped in a conical pile on a tile or a flagstone and lit at the apex. They require no cases. Usually the fire is coloured,—green, red, or blue; and beautiful effects are obtained by illuminating buildings with it. It is also used on the stage; but, in that

case, the composition must be such as to give no suffocating or poisonous fumes. *Bengal lights* are very similar, but are piled in saucers, covered with gummed paper, and lit by means of pieces of match. *Marroons* are small boxes wrapped round several times with lind cord and filled with a strong composition which explodes with a loud report. They are generally used in *batteries*, or in combination with some other form of firework. *Squibs* are straight cylindrical cases about 6 inches long, firmly closed at one end, tightly packed with a strong composition, and capped with touch-paper. Usually a little bursting-powder is put in before the ordinary composition, so that the fire is finished by an explosion. The character of the fire is, of course, susceptible of great variation in colour, &c. *Crackers* are characterized by the cases being doubled backwards and forwards several times, the folds being pressed close and secured by twine. One end is primed; and when this is lit the cracker burns with a hissing noise, and a loud report occurs every time the fire reaches a bend. If the cracker is placed on the ground, it will give a jump at each report; so that it cannot quite fairly be classed among the fixed fireworks. *Roman candles* are straight cylindrical cases filled with layers of composition and *stars* alternately. These stars are simply balls of some special composition, usually containing metallic filings, made up with gum and spirits of wine, cut to the required size and shape, dusted with gunpowder, and dried. They are discharged like blazing bullets several feet into the air, and produce a beautiful effect, which may be enhanced by packing stars of differently coloured fire in one case. *Gerbes* are choked cases, not unlike Roman candles, but often of much larger size. Their fire spreads like a sheaf of wheat. They may be packed with variously coloured stars, which will rise 30 feet or more. *Lances* are small straight cases charged with compositions like those used for making stars. They are mostly used in complex devices, for which purpose they are fixed with wires on suitable wooden frames. They are connected by *leaders*, i.e., by quick-match enclosed in paper tubes, so that they can be regulated to take fire all at the same time, singly, or in detachments, as may be desired. The devices constructed in this way are often of an extremely elaborate character; and they include all the varieties of *lettered designs*, of *fixed suns*, *fountains*, *palm-trees*, *waterfalls*, *mosaic work*, *Highland tartan*, &c.

Rotating Fireworks.—*Pin* or *Catherine wheels* are long paper cases filled with a composition by means of a funnel and packing-wire and afterwards wound round a disk of wood. This is fixed by a pin, sometimes vertically and sometimes horizontally; and the outer primed end of the spiral is lit. As the fire escapes the recoil causes the wheel to revolve in an opposite direction and often with considerable velocity. *Pastilles* are very similar in principle and construction. Instead of the case being wound in a spiral and made to revolve round its own centre point, it may be used as the engine to drive a wheel or other form of framework round in a circle. Many varied effects are thus produced, of which the *fire-wheel* is the simplest. Straight cases, filled with some fire-composition, are attached to the end of the spokes of a wheel or other mechanism capable of being rotated. They are all pointed in the same direction at an angle to the spokes, and they are connected together by leaders, so that each, as it burns out, fires the one next it. The pieces may be so chosen that brilliant effects of changing colour are produced; or various fire-wheels of different colours may be combined, revolving in different planes and different directions—some fast and some slowly. *Bisecting wheels*, *plural wheels*, *caprice wheels*, *spiral wheels*, are all more or less complicated forms; and it is possible to produce, by mechanism of this nature, a model in fire of the solar system.

Ascending Fireworks.—*Tourbillions* are fireworks so constructed as to ascend in the air and rotate at the same time, forming beautiful spiral curves of fire. The straight cylindrical case is closed at the centre and at the two ends with plugs of plaster of Paris, the composition occupying the intermediate parts. The fire finds vent by six holes pierced in the case. Two of these are placed close to the ends, but at opposite sides, so that one end discharges to the right and the other to the left; and it is this which imparts the rotatory motion. The other holes are placed along the middle line of what is the under-surface of the case when it is laid horizontally on the ground; and these, discharging downwards, impart an upward motion to the whole. A cross piece of wood balances the tourbillion; and the quick-match and touch-paper are so arranged that combustion begins at the two ends simultaneously and does not reach the holes of ascension till after the rotation is fairly begun. The *sky-rocket* is generally considered the most beautiful of all fireworks; and it certainly is the one that requires most skill and science in its construction. It consists essentially of two parts,—the body and the head. The body is a straight cylinder of strong pasted paper and is choked at the lower end, so as to present only a narrow opening for the escape of the fire. The composition does not fill up the case entirely, for a central hollow conical bore extends from the choked mouth up the body for three quarters of its length. This is an essential feature of the rocket. It allows of nearly the whole composition being fired at once; the

result of which is that an enormous quantity of heated gases collects in the hollow bore and the gases, forcing their way downwards through the narrow opening, urge the rocket up through the air. The top of the case is closed by a plaster-of-Paris plug. A hole passes through this and is filled with a fuse, which serves to communicate the fire to the head after the body is burned out. This head, which is made separately and fastened on after the body is packed, consists of a short cylindrical paper chamber with a conical top. It serves the double purpose of cutting a way through the air and of holding the *garniture* of stars, sparks, crackers, serpents, gold and silver rain, &c., which are scattered by bursting fire as soon as the rocket reaches the highest point of its path. A great variety of beautiful effects may be obtained by the exercise of ingenuity in the choice and construction of this garniture. Many of the best results have been obtained by unpublished methods which must be regarded as the secrets of the trade. The *stick* of the sky-rocket serves the purpose of guiding and balancing it in its flight; and its size must be accurately adapted to the dimensions of the case. In *winged* rockets the stick is replaced by cardboard wings, which act like the feathers of an arrow. A *girandole* is the simultaneous discharge of a large number of rockets (often from one hundred to two hundred), which either spread like a peacock's tail or pierce the sky in all directions with rushing lines of fire. This is usually the final feat of a great pyrotechnic display.

For a description of rockets used in war, see **AMMUNITION**.

PYRRHO. See **SCEPTICISM**.

PYRRHUS. The name of Pyrrhus, king of Epirus, owes its chief fame in history to the fact that with his invasion of Italy in the early part of the 3d century B.C. Greece and Rome for the first time came definitely into contact. Born about the year 318, and claiming descent from Pyrrhus, the son of Achilles, connected also with the royal family of Macedonia through Olympias, the mother of Alexander the Great, he became when a mere stripling king of the wild mountain tribes of Epirus, and learned how to fight battles in the school of Demetrius Poliorcetes (the Besieger) and of his father Antigonus. He fought by their side in his seventeenth year at the memorable battle of Ipsus in Phrygia, in which they were decisively defeated by the combined armies of Seleucus and Lysimachus. Soon afterwards he was sent to the court of Ptolemy of Egypt at Alexandria as a pledge for the faithful carrying out of a treaty of alliance between Ptolemy and Demetrius, as his sister Deidamia was the wife of the latter. Through Ptolemy, whose step-daughter Antigone he married, he was enabled to establish himself firmly on the throne of Epirus, and he became a formidable opponent to Demetrius, who was now king of Macedonia and the leading man in the Greek world. He won a victory over one of Demetrius's generals in Atolia, invaded Macedonia, and forced Demetrius to conclude a truce with him. For a brief space of about seven months he had possession of a large part of Macedonia, Demetrius finding it convenient to make this surrender on condition that Pyrrhus did not meddle with the affairs of the Peloponnesus. But in 286 he was defeated by Lysimachus at Edessa, driven out of Macedonia, and compelled to fall back on his little kingdom of Epirus. In 280 came the great opportunity of his life, the embassy from the famous Greek city Tarentum in southern Italy with a request for aid against Rome, whose hostility the Tarentines had recklessly provoked. Pyrrhus had a trusted friend and adviser in Cineas of Thessaly, a persuasive speaker and a clever diplomatist, and he at once sent him over with 3000 men to Tarentum with a view to prepare matters. He himself soon followed, after a disastrous passage across the Adriatic, with a miscellaneous force, furnished him partly by the assistance of Ptolemy, of about 25,000 men, with some elephants, his best troops being some Macedonian infantry and Thessalian cavalry. He had counted on an army of Italian mercenaries, but the Tarentines and the Italian Greeks.

generally shrank from anything like serious effort and resented his calling upon them for men and money. Rome meantime raised a special war contribution, called on her subjects and allies for their full contingent of troops, and posted strong garrisons in all towns of doubtful fidelity. She was now quite the dominant power in Italy, but her position was critical, as in the north she had had trouble with the Etruscans and Gauls, while in the south the Lucanians and Bruttians were making common cause with Tarentum and the Greek cities. In fact there was the possibility of a most formidable coalition of the Italian peoples both in the north and in the south against Rome, and so Pyrrhus had a good deal on which to build his hopes of success. For the first time in history Greeks and Romans met in battle at Heraclea near the shores of the Gulf of Tarentum, and the cavalry and elephants of Pyrrhus secured for him a complete victory, though at so heavy a loss as to convince him of the great uncertainty of final success. Although he now had the Samnites as well as the Lucanians and Bruttians and all the Greek cities of southern Italy with him, he found every city closed against him as he advanced on Rome through Latium, and his dexterous minister Cineas utterly failed to negotiate a peace, the old blind Appius Claudius declaring in the senate that Rome never negotiated with a foreign enemy on Italian ground. In the second year of the war, 279, Pyrrhus again defeated a Roman army at Asculum (Ascoli) in Apulia, but he was no nearer decisive success, as Rome still had armies in the field and her Italian confederation was not broken up. For a while he quitted Italy for Sicily with the view of making himself the head of the Sicilian Greeks and driving the Carthaginians out of the island. In his military operations he was on the whole successful, and Rome and Carthage in face of the common danger concluded an offensive and defensive alliance against him. He passed three years in Sicily, but through want of political tact he gave offence to the Greek cities, which he treated rather too much in the fashion of a despot, not paying any respect to their local constitutions or sufficiently humouring their republican tastes and love of independence. He thus lost a good opportunity of uniting both the Italian and Sicilian Greeks against Rome. On his return to Italy in 276 he had neither men nor money adequately supplied him, as Tarentum and the other Greek cities had no confidence in him. It is said that he was thoroughly disheartened, and was haunted by mysterious dreams and forebodings which followed on an act which he imagined had involved him in the guilt of sacrilege. He made indeed one more effort, and engaged a Roman army at Beneventum in the Samnite country, but his arrangements for the battle miscarried, and he was defeated with the loss of his camp and the greater part of his army. He had made a fair trial of the strength of Rome and had been utterly baffled. Nothing remained but to go back to his allies at Tarentum. He left a garrison in the city and returned the following year to his home in Epirus after a six years' absence. The brief remainder of his life was passed in camps and battles, without, however, any glorious result. He won a victory over Antigonus Gonatas, king of Macedonia, on Macedonian ground. In 273 he was invited into the Peloponnesus to settle at the sword's point a dispute about the royal succession at Sparta. He besieged the city, but was repulsed with great loss. Next he went to Argos at the invitation of a political faction, and here in the confusion of a fight by night in the streets he met his death in his forty-sixth year from the hand of a woman, who hurled a ponderous roof-tile upon his head just at the moment, it is said, when he was striking a blow at her son.

Pyrrhus was no doubt a brilliant and dashing soldier,

but he was aptly compared "to a gambler who made many good throws with the dice, but could not make the proper use of the game." There was something chivalrous about him which seems to have made him a general favourite. After his death Macedonia had for a time at least nothing to fear, and the liberty of Greece was quite at the mercy of that power.

For Pyrrhus, English readers will do well to consult Thirlwall, *Greece*, vols. vii., viii.; Mommsen, *History of Rome*, ii. 7; Niebuhr, *Lectures on Roman History*, lects. l., li. Plutarch's *Life of Pyrrhus* is the fullest of our original sources of information, and there is frequent mention of him in Polybius.

PYTHAGORAS AND PYTHAGOREANS. Pythagoras is one of those figures which have so impressed the imagination of succeeding times that their historical lineaments are difficult to discern through the mythical haze that envelops them. Animated, as it would appear, not merely by the philosophic thirst for knowledge but also by the enthusiasm of an ethico-religious reformer, he became, centuries after his death, the ideal hero or saint of those who grafted a mystical religious asceticism on the doctrines of Plato. Writings were forged in his name. Lives of him were written which gather up in his person all the traits of the philosophic wise man, and surround him besides with the nimbus of the prophet and wonder-worker. He is described by his Neoplatonic biographers as the favourite and even the son of Apollo, from whom he received his doctrines by the mouth of the Delphic priestess. We read that he had a golden thigh, which he displayed to the assembled Greeks at Olympia, and that on another occasion he was seen in Crotona and Metapontum at one and the same time. He is said to have tamed wild beasts by a word and to have foretold the future, while many stories turn upon the knowledge he was reported to retain of his personality and deeds in former states of existence. Thus, as Zeller truly remarks, the information respecting Pythagoreanism and its founder grows fuller and fuller the farther removed in time it is from its subject. The authentic details of Pythagoras's career, on the other hand, are meagre enough and merely approximate in character. He was a native of Samos, and the first part of his life may therefore be said to belong to that Ionian seaboard which had already witnessed the first development of philosophic thought in Greece. The exact year of his birth has been variously placed between 586 and 569 B.C., but 582 may be taken as the most probable date. Some of the accounts make him the pupil of Anaximander; but such an assertion lies so ready to hand in the circumstances of time and place that we cannot build with any assurance upon the suggested connexion with the Ionic school. It is probable, however, that Pythagoras was aware of their speculations, seeing that he left behind him in Ionia the reputation of a learned and universally informed man. "Of all men Pythagoras, the son of Mnesarchus, was the most assiduous inquirer," says Heraclitus, and then proceeds in his contemptuous fashion to brand his predecessor's wisdom as only eclectically compiled information or polymathy (*πολυμαθία*). This accumulated wisdom, as well as most of the tenets of the Pythagorean school, was attributed in antiquity to the extensive travels of Pythagoras, which brought him in contact (so it was said) not only with the Egyptians, the Phœnicians, the Chaldeans, the Jews, and the Arabians, but also with the Druids of Gaul, the Persian Magi, and the Brahmans. But these tales are told of too many of the early philosophers to be received implicitly; they represent rather the tendency of a later age to connect the beginnings of Greek speculation with the hoary religions and priesthoods of the East. There is no intrinsic improbability, however, in the statement that Pythagoras visited Egypt and other countries of the Mediterranean,

for travel was then one of the few ways of gathering knowledge. Some of the accounts represent Pythagoras as deriving much of his mathematical knowledge from an Egyptian source. Herodotus traces the doctrine of metempsychosis to Egypt, as well as the practice of burying the dead exclusively in linen garments, but he does not mention any visit of Pythagoras to that country. There is thus little more than conjecture to fill out the first half of the philosopher's life. The historically important part of his career begins with his emigration to Crotona, one of the Dorian colonies in the south of Italy. Nothing is known with certainty of the reasons that led to this step, which he appears to have taken about the year 529; perhaps the ethical temper which can be traced in the Pythagorean school attracted the founder towards the sterner Dorian character. At Crotona Pythagoras speedily became the centre of a widespread and influential organization, which seems to have resembled a religious brotherhood or an association for the moral reformation of society much more than a philosophic school. Pythagoras appears, indeed, in all the accounts more as a moral reformer than as a speculative thinker or scientific teacher; and it is noteworthy that the only one of the doctrines of the school which is definitely traceable to Pythagoras himself is the ethico-mystical doctrine of transmigration. The aim of the brotherhood was the moral education and purification of the community; and it seems to have been largely based upon a revival of the Dorian ideal of abstinence and hardihood along with certain other traits of a more definitely religious character, which were probably due to the influence of the mysteries. But many details of life and ritual, such as abstinence from animal food and from beans, celibacy, and even community of goods, have been fathered by the organized asceticism of a later period upon the original followers of Pythagoras. Ethics, according to the Greek and especially according to the Dorian conception, being inseparably bound up with the general health of the state, we are not surprised to find the Pythagoreans represented as a political league; nor is it wonderful that their following was among the aristocracy, and that they formed the staunchest supporters of the old Dorian constitutions. It is unfair, however, to speak of the league as primarily a political organization, wide though its political ramifications must latterly have become. Its entanglement with politics was in the end fatal to its existence. The authorities differ hopelessly in chronology, but according to the balance of evidence the first reaction against the Pythagoreans took place in the lifetime of Pythagoras himself after the victory gained by Crotona over Sybaris in the year 510. Dissensions seem to have arisen about the allotment of the conquered territory, and an adverse party was formed in Crotona under the leadership of Cylon. This was probably the cause of Pythagoras's withdrawal to Metapontum, which an almost unanimous tradition assigns as the place of his death in the end of the 6th or the beginning of the 5th century. The league appears to have continued powerful in Magna Græcia till the middle of the 5th century, when it was violently trampled out by the successful democrats. The meeting-houses of the Pythagoreans were everywhere sacked and burned; mention is made in particular of "the house of Milo" in Crotona, where fifty or sixty of the leading Pythagoreans were surprised and slain. The persecution to which the brotherhood was subjected throughout Magna Græcia was the immediate cause of the spread of the Pythagorean philosophy in Greece proper. Philolaus, who resided at Thebes in the end of the 5th century (cf. Plato, *Phædo*, 61D), was the author of the first written exposition of the system. Lysis, the instructor of Epaminondas, was another of these refugees. This Theban Pythagoreanism

was not without an important influence upon Plato, and Philolaus had also disciples in the stricter sense. But as a philosophic school Pythagoreanism became extinct in Greece about the middle of the 4th century. In Italy—where, after a temporary suppression, it attained a new importance in the person of Archytas, ruler of Tarentum—the school finally disappeared about the same time.

Pythagorean Philosophy.

The central thought of the Pythagorean philosophy is the idea of number, the recognition of the numerical and mathematical relations of things. In the naive speculation of an early age the abstract consideration of these relations was tantamount to asserting their essential existence as the causes of phenomena. Hence the Pythagorean thought crystallized into the formula that all things are number, or that number is the essence of everything. "The Pythagoreans seem," says Aristotle, "to have looked upon number as the principle and, so to speak, the matter of which existences consist"; and again, "they supposed the elements of numbers to be the elements of existence, and pronounced the whole heaven to be harmony and number." "Number," says Philolaus, "is great and perfect and omnipotent, and the principle and guide of divine and human life." Fantastical as such a proposition sounds, we may still recognize the underlying truth that prompted it if we reflect that it is number or definite mathematical relation that separates one thing from another and so in a sense makes them things. Without number and the limitation which number brings there would be only chaos and the illimitable, a thought abhorrent to the Greek mind. Number, then, is the principle of order, the principle by which a cosmos or ordered world subsists. So we may perhaps render the thought that is crudely and sensuously expressed in the utterances of the school. They found the chief illustrations, or rather grounds, of their position in the regular movements of the heavenly bodies and in the harmony of musical sounds, the dependence of which on regular mathematical intervals they were apparently the first to discover. The famous theory of the harmony of the spheres combines both ideas: the seven planets are the seven golden chords of the heavenly heptachord.

Immediately connected with their central doctrine is the theory of opposites held by the Pythagoreans. Numbers are divided into odd and even, and from the combination of odd and even the numbers themselves (and therefore all things) seem to result. The odd number was identified with the limited, the even with the unlimited, because even numbers may be perpetually halved, whereas the odd numbers (at least the earlier ones), being without factors, seem to stand in solid singleness. All things, accordingly, were derived by the Pythagoreans from the combination of the limited and the unlimited; and it is in harmony with the Greek spirit that the place of honour is accorded to the odd or the limited. Following out the same thought, they developed a list of ten fundamental oppositions, which roughly resembles the tables of categories framed by later philosophers:—(1) limited and unlimited; (2) odd and even; (3) one and many; (4) right and left; (5) masculine and feminine; (6) rest and motion; (7) straight and crooked; (8) light and darkness; (9) good and evil; (10) square and oblong. The arbitrariness of the list and the mingling of mathematical, physical, and ethical contrasts are characteristic of the infancy of speculation. The union of opposites in which consists the existence of things is harmony; hence the expression already quoted that the whole heaven or the whole universe is harmony. But it is to be noted that interpretations of Pythagoreanism which represent the whole system as founded on the opposition of unity and duality, and suppose this to have been explicitly identified with the opposition of form and matter, of divine activity and passive material, must be unhesitatingly rejected as betraying on the surface their post-Platonic origin. Still more is this the case when in Neoplatonic fashion they go on to derive this original opposition from the supreme Unity or God. The further speculations of the Pythagoreans on the subject of number rest mainly on analogies, which often become capricious and tend to lose themselves at last in a barren symbolism. The decade, as the basis of the numerical system, appeared to them to comprehend all other numbers in itself, and to it are applied, therefore, the epithets quoted above of number in general. Similar language is held of the number "four," because it is the first square number and is also the potential decade ($1 + 2 + 3 + 4 = 10$); Pythagoras is celebrated as the discoverer of the holy *τετρακτὸς*, "the fountain and root of ever-living nature." "Seven" is called *ἑπταέτης* and *Ἀθήνη*, because within the decade it has neither factors nor product. "Five," on the other hand, signifies marriage, because it is the union of the first masculine with the first feminine number ($3 + 2$, unity being considered as a number apart). The thought already becomes more fanciful when "one" is identified with reason, because it is unchangeable; "two" with opinion, because it is unlimited and indeterminate; "four" with justice, because it is the first square

number, the product of equals. More legitimate is their application of number to geometry, according to which "one" was identified with the point, "two" with the line, "three" with the surface, and "four" with the cube. In the history of music the Pythagorean school is also of considerable importance from the development which the theory of the octave owes to its members; according to some accounts the discovery of the harmonic system is due to Pythagoras himself.

As already mentioned, the movements of the heavenly bodies formed for the Pythagoreans an illustration on a grand scale of the truth of their theory. Their cosmological system is also interesting on account of peculiarities which mark it out from the current conceptions of antiquity and bring it curiously near to the modern theory. Conceiving the universe, like many early thinkers, as a sphere, they placed in the heart of it the central fire, to which they gave the name of Hestia, the hearth or altar of the universe, the citadel or throne of Zeus. Around this move the ten heavenly bodies—farthest off the heaven of the fixed stars, then the five planets known to antiquity, then the sun, the moon, the earth, and lastly the counter-earth (*ἀντίχθων*), which revolves between the earth and the central fire and thus completes the sacred decade. Revolving along with the earth, the last-mentioned body is always interposed as a shield between us and the direct rays of the central fire. Our light and heat come to us indirectly by way of reflexion from the sun. When the earth is on the same side of the central fire as the sun, we have day; when it is on the other side, night. This attribution of the changes of day and night to the earth's own motion led up directly to the true theory, as soon as the machinery of the central fire and the counter-earth was dispensed with. The counter-earth became the western hemisphere, and the earth revolved on its own axis instead of round an imaginary centre. But, as appears from the above, the Pythagorean astronomy is also remarkable as having attributed a planetary motion to the earth instead of making our globe the centre of the universe. Long afterwards, when the church condemned the theory of Copernicus, the indictment that lay against it was its heathen and "Pythagorean" character.

The doctrine which the memory of mankind associates most closely with Pythagoras's name is that of the transmigration of souls—*ΜΕΤΕΜΨΥΧΩΣΙΣ* (*q. v.*). Though evidently of great importance for Pythagoras himself, it does not stand in any very obvious connexion with his philosophy proper. He seems to have adopted the idea from the Orphic Mysteries. The bodily life of the soul, according to this doctrine, is an imprisonment suffered for sins committed in a former state of existence. At death the soul reaps what it has sown in the present life. The reward of the best is to enter the cosmos, or the higher and purer regions of the universe, while the direst crimes receive their punishment in Tartarus. But the general lot is to live afresh in a series of human or animal forms, the nature of the bodily prison being determined in each case by the deeds done in the life just ended. This is the same doctrine of retribution and purificatory wandering which meets us in Plato's mythical descriptions of a future life. They are borrowed by him in their substance from the Pythagoreans or from a common source in the Mysteries. In accordance with this religious view of life as a stage of probation were the ethical precepts of the school, inculcating reverence towards the gods and to parents, justice, gentleness, temperance, purity of life, prayer, regular self-examination, and the observance of various ritual requirements.

Connecting its ethics in this way with religion and the idea of a future life, the Pythagorean societies had in them from the beginning a germ of asceticism and contemplative mysticism which it was left for a later age fully to develop. The Pythagorean life was destined to survive the peculiar doctrines of the Pythagorean philosophy and to be grafted on later philosophic ideas. The asceticism which characterized it appears in the 4th century B.C. in close connexion with the Orphic Mysteries; and the "Pythagoreans" of that time are frequently the butts of the New Athenian Comedy. In the Alexandrian period the Pythagorean tradition struck deeper roots; in Alexandria and elsewhere schools of men arose calling themselves Pythagoreans, but more accurately distinguished by modern criticism as Neopythagoreans, seeing that their philosophical doctrines are evidently derived in varying proportions from Plato, Aristotle, and the Stoics. In general it may be said that they develop the mystic side of the Platonic doctrine; and only so far as this is connected with the similar speculations of Pythagoras can they claim to be followers of the latter. Hence men like Plutarch, who personally prefer to call themselves Platonists, may also be considered as within the scope of this Pythagorean revival. The link that really connects these Neopythagoreans with the Samian philosopher and distinguishes them from the other schools of their time is their ascetic ideal of life and their preoccupation with religion. In religious speculation they paved the way for the Neoplatonic conception of God as immeasurably transcending the world; and in their thirst for prophecies, oracles, and signs they gave expression to the prevalent longing for a supernatural revelation of the divine nature and will. The

asceticism of the Jewish sect of the Essenes seems, as Zeller contends, to be due to a strong infusion of Neopythagorean elements. At a still later period Neopythagoreanism set up Pythagoras and Apollonius of Tyana not only as ideals of the philosophic life but also as prophets and wonder-workers in immediate communication with another world, and in the details of their "lives" it is easy to read the desire to emulate the narrative of the Gospels. The *Life* of Apollonius by Philostratus, which is for the most part an historical romance, belongs to the 3d Christian century.

Zeller's discussion of Pythagoreanism, in his *Philosophie d. Griechen*, book i., is very full; he also deals at considerable length in the last volume of the work with the Neopythagoreans, considered as the precursors of Neoplatonism and the probable origin of the Essenes. The numerous monographs dealing with special parts of the subject are there examined and sifted. (A. SE.)

Pythagorean Geometry.

As the introduction of geometry into Greece is by common consent attributed to Thales, so all are agreed that to Pythagoras is due the honour of having raised mathematics to the rank of a science. We know that the early Pythagoreans published nothing, and that, moreover, they referred all their discoveries back to their master. (See PHILOLAUS.) Hence it is not possible to separate his work from that of his early disciples, and we must therefore treat the geometry of the early Pythagorean school as a whole. We know that Pythagoras made numbers the basis of his philosophical system, as well physical as metaphysical, and that he united the study of geometry with that of arithmetic.

The following statements have been handed down to us. (a) Aristotle (*Met.*, i. 5, 985) says "the Pythagoreans first applied themselves to mathematics, a science which they improved; and, penetrated with it, they fancied that the principles of mathematics were the principles of all things." (b) Eudemus informs us that "Pythagoras changed geometry into the form of a liberal science, regarding its principles in a purely abstract manner, and investigated its theorems from the immaterial and intellectual point of view (*ἀτλως καὶ νοερώς*)."¹ (c) Diogenes Laertius (viii. 11) relates that "it was Pythagoras who carried geometry to perfection, after Moëris² had first found out the principles of the elements of that science, as Anticlidides tells us in the second book of his *History of Alexander*; and the part of the science to which Pythagoras applied himself above all others was arithmetic." (d) According to Aristoxenus, the musician, Pythagoras seems to have esteemed arithmetic above everything, and to have advanced it by diverting it from the service of commerce and by likening all things to numbers.³ (e) Diogenes Laertius (viii. 13) reports on the same authority that Pythagoras was the first person who introduced measures and weights among the Greeks. (f) He discovered the numerical relations of the musical scale (Diog. Laert., viii. 11). (g) Proclus⁴ says that "the word 'mathematics' originated with the Pythagoreans." (h) We learn also from the same authority⁵ that the Pythagoreans made a fourfold division of mathematical science, attributing one of its parts to the "how many" (*τὸ πῶσον*) and the other to the "how much" (*τὸ πηλίκον*); and they assigned to each of these parts a twofold division. They said that discrete quantity or the "how many" is either absolute or relative, and that continued quantity or the "how much" is either stable or in motion. Hence they laid down that arithmetic contemplates that discrete quantity which subsists by itself, but music that which is related to another; and that geometry considers continued quantity so far as it is immovable,

⁵ *Op. cit.*, p. 35.

but that astronomy (ἡ σφαιρική) contemplates continued quantity so far as it is of a self-motive nature. (i) Diogenes Laertius (viii. 25) states, on the authority of Favorinus, that Pythagoras "employed definitions in the mathematical subjects to which he applied himself."

The following notices of the geometrical work of Pythagoras and the early Pythagoreans are also preserved. (1) The Pythagoreans define a point as "unity having position" (Procl., *op. cit.*, p. 95). (2) They considered a point as analogous to the monad, a line to the duad, a superficies to the triad, and a body to the tetrad (*ib.*, p. 97). (3) They showed that the plane around a point is completely filled by six equilateral triangles, four squares, or three regular hexagons (*ib.*, p. 305). (4) Eudemos ascribes to them the discovery of the theorem that the interior angles of a triangle are equal to two right angles, and gives their proof, which was substantially the same as that in Euclid I. 32¹ (*ib.*, p. 379). (5) Proclus informs us in his commentary on Euclid I. 44 that Eudemos says that the problems concerning the application of areas—where the term "application" is not to be taken in its restricted sense (παράβολή), in which it is used in this proposition, but also in its wider signification, embracing ὑπερβολή and ἔλλειψις, in which it is used in Book VI. Props. 28, 29—are old, and inventions of the Pythagoreans² (*ib.*, p. 419). (6) This is confirmed by Plutarch,³ who says, after Apollodorus, that Pythagoras sacrificed an ox on finding the geometrical diagram, either the one relating to the hypotenuse, namely, that the square on it is equal to the sum of the squares on the sides, or that relating to the problem concerning the application of an area.⁴ (7) Plutarch⁵ also ascribes to Pythagoras the solution of the problem, To construct a figure equal to one and similar to another given figure. (8) Eudemos states that Pythagoras discovered the construction of the regular solids (Procl., *op. cit.*, p. 65). (9) Hippiasus, the Pythagorean, is said to have perished in the sea on account of his impiety, inasmuch as he boasted that he first divulged the knowledge of the sphere with the twelve pentagons (the inscribed ordinate dodecahedron): Hippiasus assumed the glory of the discovery to himself, whereas everything belonged to Him—"for thus they designate Pythagoras, and do not call him by name."⁶ (10) The triple interwoven triangle or pentagram—star-shaped regular pentagon—was used as a symbol or sign of recognition by the Pytha-

goreans and was called by them "health" (ὑγίεια).⁷ (11) The discovery of the law of the three squares (Euclid I. 47), commonly called the "theorem of Pythagoras," is attributed to him by many authorities, of whom the oldest is Vitruvius.⁸ (12) One of the methods of finding right-angled triangles whose sides can be expressed in numbers (Pythagorean triangles)—that setting out from the odd numbers—is referred to Pythagoras by Heron of Alexandria and Proclus.⁹ (13) The discovery of irrational quantities is ascribed to Pythagoras by Eudemos (Procl., *op. cit.*, p. 65). (14) The three proportions—arithmetical, geometrical, and harmonical—were known to Pythagoras.¹⁰ (15) Iamblichus¹¹ says, "Formerly, in the time of Pythagoras and the mathematicians under him, there were three means only—the arithmetical, the geometrical, and the third in order which was known by the name sub-contrary (ὑπεραντία), but which Archytas and Hippias designated the harmonical, since it appeared to include the ratios concerning harmony and melody." (16) The so-called most perfect or musical proportion, e.g., 6:8::9:12, which comprehends in it all the former ratios, according to Iamblichus,¹² is said to be an invention of the Babylonians and to have been first brought into Greece by Pythagoras. (17) Arithmetical progressions were treated by the Pythagoreans, and it appears from a passage in Lucian that Pythagoras himself had considered the special case of *triangular* numbers: Pythagoras asks some one, "How do you count?" he replies, "One, two, three, four." Pythagoras, interrupting, says, "Do you see? what you take to be four, that is ten and a perfect triangle and our oath."¹³ (18) The odd numbers were called by the Pythagoreans "gnomons,"¹⁴ and were regarded as generating, in

⁷ Lucian, *Pro Lapsu in Salut.*, s. 5; also schol. on Aristoph., *Aub.*, 611. That the Pythagoreans used such symbols we learn from Iamblichus (*De Vit. Pyth.*, c. 33, ss. 237 and 238). This figure is referred to Pythagoras himself, and in the Middle Ages was called *Pythagoræ figura*; even so late as Paracelsus it was regarded by him as a symbol of health. It is said to have obtained its special name from the letters ν , γ , ι , θ (= $\epsilon\iota$), α having been written at its prominent vertices.

⁸ *De Arch.*, ix. Præf., 5, 6, 7. Amongst other authorities are Diogenes Laertius (viii. 11), Proclus (*op. cit.*, p. 426), and Plutarch (*ut sup.*, 6). Plutarch, however, attributes to the Egyptians the knowledge of this theorem in the particular case where the sides are 3, 4, and 5 (*De Is. et Osir.*, c. 56).

⁹ Heron Alex., *Geom. et Stereom. Rel.*, ed. F. Hultsch, pp. 56, 146; Procl., *op. cit.*, p. 428. The method of Pythagoras is as follows:—he took an odd number as the lesser side; then, having squared this number and diminished the square by unity, he took half the remainder as the greater side, and by adding unity to this number he obtained the hypotenuse, e.g., 3, 4, 5; 5, 12, 13.

¹⁰ Nicom. Ger., *Introduct. Ar.*, c. xxii.

¹¹ In *Nicomachi Arithmetica*, ed. S. Temulius, p. 141.

¹² *Op. cit.*, p. 168. As an example of this proportion Nicomachus and, after him, Iamblichus give the numbers 6, 8, 9, 12, the harmonical and arithmetical means between two numbers forming a geometric proportion with the numbers themselves ($a : \frac{2ab}{a+b} :: \frac{a+b}{2} : b$). Iamblichus further relates (i.e.) that many Pythagoreans made use of this proportion, as Aristæus of Crotona, Timæus of Locri, Philolaus and Archytas of Tarentum, and many others, and after them Plato in his *Timæus* (see Nicom., *Inst. Arithm.*, ed. Ast, p. 153, and *Animadversiones*, pp. 327-329; and Iamb., *op. cit.*, p. 172 sq.).

¹³ *Biogr. præf.*, 4, vol. i. p. 317, ed. C. Jacobitz.

¹⁴ Γνώμων means that by which anything is known, or "criterion"; its oldest concrete signification seems to be the carpenter's square (*νομῶνα*) by which a right angle is known. Hence it came to denote a perpendicular, of which, indeed, it was the archaic name (Proclus, *op. cit.*, p. 283). Gnomon is also an instrument for measuring altitudes, by means of which the meridian can be found; it denotes, further, the index or style of a sun-dial, the shadow of which points out the hour. In geometry it means the square or rectangle about the diagonal of a square or rectangle, together with the two complements, on account of the resemblance of the figure to a carpenter's square; and then, more generally, the similar figure with regard to any parallelogram, as defined by Euclid II. Def. 2. Again, in a still more general signification, it means the figure which, being added to any figure, preserves the original form. See Heron, *Definitiones* (59). When

¹ We learn, however, from a fragment of Geminus, which has been handed down by Eutocius in his commentary on the *Conics* of Apollonius (Apoll., *Conica*, ed. Halleus, p. 9), that the ancient geometers observed two right angles in each species of triangle, in the equilateral first, then in the isosceles, and lastly in the scalene, whereas later writers proved the theorem generally thus—"The three internal angles of every triangle are equal to two right angles."

² The words of Proclus are interesting. "According to Eudemos the inventions respecting the application, excess, and defect of areas are ancient, and are due to the Pythagoreans. Moderns, borrowing these names, transferred them to the so-called conic lines, the parabola, the hyperbola, the ellipse, as the older school, in their nomenclature concerning the description of areas *in plano* on a finite right line, regarded the terms thus:—An area is said to be *applied* (παράβállειν) to a given right line when an area equal in content to some given one is described thereon; but when the base of the area is greater than the given line, then the area is said to be in *excess* (ὑπερβάλλειν); but when the base is less, so that some part of the given line lies without the described area, then the area is said to be in *defect* (ἐλλείπειν). Euclid uses in this way in his sixth book the terms *excess* and *defect*. . . . The term *application* (παράβállειν), which we owe to the Pythagoreans, has this signification."

³ *Non posse suaviter vivi sec. Epicurum*, c. xi.

⁴ Ἐφε πρόσλημα περί τοῦ χωρίου τῆς παραβολῆς. Some authors, rendering the last five words "concerning the area of the parabola," have ascribed to Pythagoras the quadrature of the parabola, which was one of the great discoveries of Archimedes.

⁵ *Symp.* viii., Quæst. 2, c. 4.

⁶ Iamblichus, *De Vit. Pyth.*, c. 18, s. 88.

asmuch as by the addition of successive gnomons—consisting each of an odd number of unit squares—to the original square unit or monad the square form was preserved. (19) In like manner, if the simplest oblong (ἐρεβμήκης), consisting of two unit squares or monads in juxtaposition, be taken and four unit squares be placed about it after the manner of a gnomon, and then in like manner six, eight . . . unit squares be placed in succession, the oblong form will be preserved. (20) Another of his doctrines was, that of all solid figures the sphere was the most beautiful, and of all plane figures the circle.¹ (21) According to Iamblichus the Pythagoreans are said to have found the quadrature of the circle.²

On examining the purely geometrical work of Pythagoras and his early disciples, as given in the preceding extracts, we observe that it is much concerned with the geometry of areas, and we are indeed struck with its Egyptian character. This appears in the theorem (3) concerning the filling up a plane with regular figures—for floors or walls covered with tiles of various colours were common in Egypt; in the construction of the regular solids (8), for some of them are found in Egyptian architecture; in the problems concerning the application of areas (5); and lastly, in the theorem of Pythagoras (11), coupled with his rule for the construction of right-angled triangles in numbers (12). We learn from Plutarch that the Egyptians were acquainted with the geometrical fact that a triangle whose sides contain three, four, and five parts is right-angled, and that the square of the greatest side is equal to the squares of the sides containing the right angle. It is probable too that this theorem was known to them in the simple case where the right-angled triangle is isosceles, inasmuch as it would be at once suggested by the contemplation of a floor covered with square tiles—the square on the diagonal and the sum of the squares on the sides contain each four of the right-angled triangles into which one of the squares is divided by its diagonal. It is easy now to see how the problem to construct a square which shall be equal to the sum of two squares could, in some cases, be solved numerically. From the observation of a chequered board it would be perceived that the element in the successive formation of squares is the gnomon or carpenter's square. Each gnomon consists of an odd number of squares, and the successive gnomons correspond to the successive odd numbers, and include, therefore, all odd squares. Suppose, now, two squares are given, one consisting of sixteen and the other of nine unit squares, and that it is proposed to form from them another square. It is evident that the square consisting of nine unit squares can take the form of the fourth gnomon, which, being placed round the former square, will generate a new square containing twenty-five unit squares. Similarly it may have been observed that the twelfth gnomon, consisting of twenty-five unit squares, could be transformed into a square each of whose sides contains five units, and thus it may have been seen conversely that the latter square, by taking the gnomonic or generating form with respect to the square on twelve units as base, would produce the square of thirteen units, and so on. This method required only to be generalized in order to enable Pythagoras to arrive at his rule for finding right-angled triangles whose sides can be expressed in numbers, which, we are told, sets out from the odd numbers. The n th square together with the n th gnomon forms the $(n+1)$ th square; if the n th gnomon contains m^2 unit squares, m being an odd number, we have $2n+1=m^2$, $\therefore n=\frac{m^2-1}{2}$, which gives the rule of Pythagoras.

The general proof of Euclid I. 47 is attributed to Pythagoras, but we have the express statement of Proclus (*op. cit.*, p. 426) that this theorem was not proved in the first instance as it is in the *Elements*. The following simple and natural way of arriving at the theorem is suggested by Bretschneider after Camerer.³ A square can be dissected into the sum of two squares and two equal rectangles, as in Euclid II. 4; these two rectangles can, by drawing their diagonals, be decomposed into four equal right-angled triangles, the sum of the sides of each being equal to the side of the square; again, these four right-angled triangles can be placed so that a vertex of each shall be in one of the corners of the square in such a way that a greater and less side are in continuation.

gnomons are added successively in this manner to a square monad, the first gnomon may be regarded as that consisting of three square monads, and is indeed the constituent of a simple Greek fret; the second of five square monads, &c.; hence we have the gnomonic numbers.

¹ Diog. Laert., *De Vit. Pyth.*, viii. 19.

² Simplicius, *In Aristotelis Physicorum libros quattuor priores Commentaria*, ed. H. Diels, p. 60.

³ See Bretsch., *Die Geom. vor Euklides*, p. 82; Camerer, *Euclidis Elem.*, vol. i. p. 444, and the references given there.

The original square is thus dissected into the four triangles as before and the figure within, which is the square on the hypotenuse. This square, therefore, must be equal to the sum of the squares on the sides of the right-angled triangle.

It is well known that the Pythagoreans were much occupied with the construction of regular polygons and solids, which in their cosmology played an essential part as the fundamental forms of the elements of the universe. We can trace the origin of these mathematical speculations in the theorem (3) that "the plane around a point is completely filled by six equilateral triangles, four squares, or three regular hexagons." Plato also makes the Pythagorean Timæus explain—"Each straight-lined figure consists of triangles, but all triangles can be dissected into rectangular ones which are either isosceles or scalene. Among the latter the most beautiful is that out of the doubling of which an equilateral arises, or in which the square of the greater perpendicular is three times that of the smaller, or in which the smaller perpendicular is half the hypotenuse. But two or four right-angled isosceles triangles, properly put together, form the square; two or six of the most beautiful scalene right-angled triangles form the equilateral triangle; and out of these two figures arise the solids which correspond with the four elements of the real world, the tetrahedron, octahedron, icosahedron, and the cube"⁴ (*Timæus*, 53, 54, 55). The construction of the regular solids is distinctly ascribed to Pythagoras himself by Eudemus (8). Of these five solids three—the tetrahedron, the cube, and the octahedron—were known to the Egyptians and are to be found in their architecture. Let us now examine what is required for the construction of the other two solids—the icosahedron and the dodecahedron. In the formation of the tetrahedron three, and in that of the octahedron four, equal equilateral triangles had been placed with a common vertex and adjacent sides coincident; and it was known that if six such triangles were placed round a common vertex with their adjacent sides coincident, they would lie in a plane, and that, therefore, no solid could be formed in that manner from them. It remained, then, to try whether five such equilateral triangles could be placed at a common vertex in like manner; on trial it would be found that they could be so placed, and that their bases would form a regular pentagon. The existence of a regular pentagon would thus become known. It was also known from the formation of the cube that three squares could be placed in a similar way with a common vertex; and that, further, if three equal and regular hexagons were placed round a point as common vertex with adjacent sides coincident, they would form a plane. It remained in this case too only to try whether three equal regular pentagons could be placed with a common vertex and in a similar way; this on trial would be found possible and would lead to the construction of the regular dodecahedron, which was the regular solid last arrived at.

We see that the construction of the regular pentagon is required for the formation of each of these two regular solids, and that, therefore, it must have been a discovery of Pythagoras. If we examine now what knowledge of geometry was required for the solution of this problem, we shall see that it depends on Euclid IV. 10, which is reduced to Euclid II. 11, which problem is reduced to the following: To produce a given straight line so that the rectangle under the whole line thus produced and the produced part shall be equal to the square on the given line, or, in the language of the ancients, To apply to a given straight line a rectangle which shall be equal to a given area—in this case the square on the given line—and which shall be *excessive* by a square. Now it is to be observed that the problem is solved in this manner by Euclid (VI. 30, 1st method), and that we know on the authority of Eudemus that the problems concerning the *application* of areas and their *excess* and *defect* are old, and inventions of the Pythagoreans (5). Hence the statements of Iamblichus concerning Hippasus (9)—that he divulged the sphere with the twelve pentagons—and of Lucian and the scholiast on Aristophanes (10)—that the pentagram was used as a symbol of recognition amongst the Pythagoreans—become of greater importance.

Further, the discovery of irrational magnitudes is ascribed to Pythagoras by Eudemus (13), and this discovery has been ever regarded as one of the greatest of antiquity. It is commonly assumed that Pythagoras was led to this theory from the consideration of the isosceles right-angled triangle. It seems to the present writer, however, more probable that the discovery of incommensurable magnitudes was rather owing to the problem: To cut a line in extreme and mean ratio. From the solution of this problem it follows at once that, if on the greater segment of a line so cut a part be taken equal to the less, the greater segment, regarded as a new line, will be cut in a similar manner; and this process can be continued without end. On the other hand, if a similar method be adopted in the case of any two lines which can be represented numerically, the process would end. Hence would arise

⁴ The dodecahedron was assigned to the fifth element, *quinta pars, æther*, or, as some think, to the universe. (See PHILOLAUS.)

the distinction between commensurable and incommensurable quantities. A reference to Euclid X. 2 will show that the method above is the one used to prove that two magnitudes are incommensurable; and in Euclid X. 3 it will be seen that the greatest common measure of two commensurable magnitudes is found by this process of continued subtraction. It seems probable that Pythagoras, to whom is attributed one of the rules for representing the sides of right-angled triangles in numbers, tried to find the sides of an isosceles right-angled triangle numerically, and that, failing in the attempt, he suspected that the hypotenuse and a side had no common measure. He may have demonstrated the incommensurability of the side of a square and its diagonal. The nature of the old proof—which consisted of a *reductio ad absurdum*, showing that, if the diagonal be commensurable with the side, it would follow that the same number would be odd and even¹—makes it more probable, however, that this was accomplished by his successors. The existence of the irrational as well as that of the regular dodecahedron appears to have been regarded by the school as one of their chief discoveries, and to have been preserved as a secret; it is remarkable, too, that a story similar to that told by Iamblichus of Hippasus is narrated of the person who first published the idea of the irrational, namely, that he suffered shipwreck, &c.²

Eudemus ascribes the problems concerning the application of figures to the Pythagoreans. The simplest cases of the problems, Euclid VI. 28, 29—those, namely, in which the given parallelogram is a square—correspond to the problem: To cut a given straight line internally or externally so that the rectangle under the segments shall be equal to a given rectilinear figure. The solution of this problem—in which the solution of a quadratic equation is implicitly contained—depends on the problem, Euclid II. 14, and the theorems, Euclid II. 5 and 6, together with the theorem of Pythagoras. It is probable that the finding of a mean proportional between two given lines, or the construction of a square which shall be equal to a given rectangle, is due to Pythagoras himself. The solution of the more general problem, Euclid VI. 25, is also attributed to him by Plutarch (7). The solution of this problem depends on that of the particular case and on the application of areas; it requires, moreover, a knowledge of the theorems: Similar rectilinear figures are to each other as the squares on their homologous sides (Euclid VI. 20); and, If three lines are in geometrical proportion, the first is to the third as the square on the first is to the square on the second. Now Hippocrates of Chios, about 440 B.C., who was instructed in geometry by the Pythagoreans, possessed this knowledge. We are justified, therefore, in ascribing the solution of the general problem, if not (with Plutarch) to Pythagoras, at least to his early successors.

The theorem that similar polygons are to each other in the duplicate ratio of their homologous sides involves a first sketch, at least, of the doctrine of proportion and the similarity of figures.³ That we owe the foundation and development of the doctrine of proportion to Pythagoras and his school is confirmed by the testimony of Nicomachus (14) and Iamblichus (15 and 16). From these passages it appears that the early Pythagoreans were acquainted, not only with the arithmetical and geometrical means between two magnitudes, but also with their harmonical mean, which was then called "subcontrary." The Pythagoreans were much occupied with the representation of numbers by geometrical figures. These speculations originated with Pythagoras, who was acquainted with the summation of the natural numbers, the odd numbers, and the even numbers, all of which are capable of geometrical representation. See the passage in Lucian (17) and the rule for finding Pythagorean triangles (12) and the observations thereon *supra*. On the other hand, there is no evidence to support the statement of Montucla that Pythagoras laid the foundation of the doctrine of *isoperimetry*, by proving that of all figures having the same perimeter the circle is the greatest, and that of all solids having the

same surface the sphere is the greatest. We must also deny to Pythagoras and his school a knowledge of the conic sections, and in particular of the quadrature of the parabola, attributed to him by some authors; and we have noticed the misconception which gave rise to this erroneous inference.

Let us now see what conclusions can be drawn from the foregoing examination of the mathematical work of Pythagoras and his school, and thus form an estimate of the state of geometry about 480 B.C. First, as to *matter*. It forms the bulk of the first two books of Euclid, and includes a sketch of the doctrine of proportion—which was probably limited to commensurable magnitudes—together with some of the contents of the sixth book. It contains too the discovery of the irrational (*ἄλογον*) and the construction of the regular solids, the latter requiring the description of certain regular polygons—the foundation, in fact, of the fourth book of Euclid. Secondly, as to *form*. The Pythagoreans first severed geometry from the needs of practical life, and treated it as a liberal science, giving definitions and introducing the manner of proof which has ever since been in use. Further, they distinguished between *discrete* and *continuous* quantities, and regarded geometry as a branch of mathematics, of which they made the fourfold division that lasted to the Middle Ages—the *quadrivium* (fourfold way to knowledge) of Boetius and the scholastic philosophy. And it may be observed that the name of "mathematics," as well as that of "philosophy," is ascribed to them. Thirdly, as to *method*. One chief characteristic of the mathematical work of Pythagoras was the combination of arithmetic with geometry. The notions of an equation and a proportion—which are common to both, and contain the first germ of algebra—were introduced among the Greeks by Thales. These notions, especially the latter, were elaborated by Pythagoras and his school, so that they reached the rank of a true scientific method in their theory of proportion.⁴ To Pythagoras, then, is due the honour of having supplied a method which is common to all branches of mathematics, and in this respect he is fully comparable to Descartes, to whom we owe the decisive combination of algebra with geometry.

Hofer, *Histoire des Mathématiques* (Paris, 1874); G. J. Allman, "Greek Geometry from Thales to Euclid," in *Hermathena*, Nos. v., vii., and x. (Dublin, 1877, 1881, and 1884); M. Cantor, *Vorlesungen über Geschichte der Mathematik* (Leipzig, 1880). The recently published *Short History of Greek Mathematics* by James Gow (Cambridge, 1884) will be found a convenient compilation. (C. J. A.)

PYTHEAS of Massilia was a celebrated Greek navigator and geographer, to whom the Greeks appear to have been indebted for the earliest information they possessed, of at all a definite character, concerning the western regions of Europe, and especially the British Islands. The period at which he lived cannot be accurately determined; but it is certain that he wrote, not only before Eratosthenes, who relied much upon his authority, but before Dicaearchus, who was a pupil of Aristotle, and died about 285 B.C. Hence he may probably be regarded as about contemporary with Alexander the Great. His work is now wholly lost, and appears to have been consulted in the original by comparatively few ancient writers, most of the

¹ For this proof, see Euclid X. 117; see also Aristot., *Analyt. Pr.*, i. c. 23 and c. 44.

² Knoche, *Untersuchungen über die neu aufgefundenen Scholien des Proklus Diadochus zu Euclid's Elementen*, pp. 20 and 23, Herford, 1865.

³ It is agreed on all hands that these two theories were treated at length by Pythagoras and his school. It is almost certain, however, that the theorems arrived at were proved for commensurable magnitudes only, and were assumed to hold good for all. The Pythagoreans themselves seem to have been aware that their proofs were not rigorous, and were open to serious objection; in this we may have the explanation of the secrecy which was attached by them to the idea of the incommensurable and to the pentagram which involved, and indeed represented, that idea. Now it is remarkable that the doctrine of proportion is *twice* treated in the *Elements* of Euclid—first, in a general manner, so as to include incommensurables, in Book V., which tradition ascribes to Eudoxus, and then arithmetically in Book VII., which, as Hankel has supposed, contains the treatment of the subject by the older Pythagoreans.

⁴ Proportion was not regarded by the ancients merely as a branch of arithmetic. We learn from Proclus that "Eratosthenes looked on proportion as the bond of mathematics" (*op. cit.*, p. 43). We are also told in an anonymous scholium on the *Elements* of Euclid, which Knoche attributes to Proclus, that the fifth book, which treats of proportion, is common to geometry, arithmetic, music, and, in a word, to all mathematical science. And Kepler, who lived near enough to the ancients to reflect the spirit of their methods, says that one part of geometry is concerned with the comparison of figures and quantities, whence proportion arises. He also adds that arithmetic and geometry afford mutual aid to each other, and that they cannot be separated.

statements cited from it being confined to detached points, which may easily have been derived at second or even third hand. We are hence left almost wholly in the dark as to the form and character of the work itself, but the various titles under which it is cited by later writers point rather to a geographical treatise, in which he had embodied the results of his observations, than to a continuous narrative of his voyage like that of a modern navigator.

Some modern writers have supposed Pytheas to have been sent out at the public expense, in command of an expedition organized by the republic of Massilia; but there is no ancient authority for this, and the statement of Polybius, who had unquestionably seen the original work, is express, that he had undertaken the voyage in a private capacity and with limited means. All that we know concerning the voyage of Pytheas (apart from such detached notices as those already referred to) is contained in a brief passage of Polybius, cited by Strabo, in which he tells us that Pytheas, according to his own statement, had not only visited Britain but had personally explored a large part of it, and stated its circumference at more than 40,000 stadia (4000 geographical miles). To this he added the account of Thule (which he placed six days' voyage to the north of Britain) and the adjoining regions, in which there was no longer any distinction between the air and earth and sea, but a kind of mixture of all three, forming a substance resembling the gelatinous mollusc known as the *Pulmo marinus*, which rendered all navigation and progress in any other mode alike impossible. This substance he had himself seen, but the other statements he derived from hearsay. Returning from thence he visited the whole of the coasts of Europe bordering on the ocean as far as the Tanais (Polyb. ap. Strab., ii. p. 104). This last sentence has led some modern writers to suppose that he made two different voyages; but this is highly improbable, and the expressions of Polybius certainly imply that his explorations in both directions, first towards the north and afterwards towards the east, formed part of one and the same voyage.

The circumstance that the countries visited, and to a certain extent explored, by Pytheas were not only previously unknown to the Greeks—except perhaps by vague hearsay accounts received through the Phoenicians—but were not visited by any subsequent authority during a period of more than two centuries led some of the later Greek geographers altogether to disregard his statements, and even to treat the whole story of his voyage as a fiction. Eratosthenes, indeed, who wrote about a century after his time, was disposed to attach great value to his authority, though doubting some of his statements; but Polybius, about half a century later, involved the whole in one sweeping condemnation, treating the work of Pytheas as a mere tissue of fables, like that of Euhemerus concerning Panchæa; and even Strabo, in whose time the western regions of Europe were comparatively well known, adopted to a great extent the same view with Polybius.

In modern times a more critical examination has arrived at a more favourable judgment, and, though Gosselin in his *Recherches sur la Géographie des Anciens* (vol. iv. pp. 168-180) and Sir G. C. Lewis in his *History of Ancient Astronomy* (pp. 466-481) revived the sceptical view, the tendency of modern critics has been rather to exaggerate than to depreciate the value of what was really added by Pytheas to geographical knowledge. The fact is that our information concerning him is so imperfect, and the scanty notices preserved to us from his work at once so meagre and discordant, that it is very difficult to arrive at anything like a sound conclusion. It may, however, be considered as fairly established that Pytheas really made a voyage round the western coasts of Europe, proceeding from Gades,

the great Phœnician emporium, and probably the farthest point familiar to the Greeks, round Spain and Gaul to the British Islands, and that he followed the eastern coast of Britain for a considerable distance to the north, obtaining information as to its farther extension in that direction which led him greatly to exaggerate its size. At the same time he heard vaguely of the existence of a large island to the north of it—probably derived from the fact of the groups of the Orkneys and Shetlands being really found in that position—to which he gave the name of Thule. No ancient writer (except a late astronomer, who merely refers to it in a passing notice and obviously at second hand) asserts that Pytheas had himself visited Thule; his account of the Sluggish Sea beyond it was, as stated by Polybius himself in the passage already cited, derived merely from hearsay.

But the most important statement made by Pytheas in regard to this unknown land of Thule, and which has given rise to most controversy in modern times, was that connected with the astronomical phenomena affecting the duration of day and night in these remote arctic regions. Unfortunately the reports transmitted to us at second hand in our existing authorities differ so widely that it is almost impossible to determine what Pytheas himself really stated. It is, however, probable that the version given in one passage by Pliny (*H.N.*, iv. 16, 104) correctly represents his authority. According to this he reported as a fact that at the summer solstice the days were twenty-four hours in length, and conversely at the winter solstice the nights were of equal duration. Of course this would be strictly true had Thule really been situated under the arctic circle, which Pytheas evidently considered it to be, and his skill as an astronomer would thus lead him to accept readily as a fact what he knew (as a voyager proceeded onwards towards the north) must be true at some point. But this statement certainly affords no evidence that he had himself actually visited the mysterious land to which it refers. (See THULE.)

Still more difficult is it to determine the extent and character of Pytheas's explorations towards the east. The statement of Polybius that he proceeded along the whole of the northern coasts of Europe as far as the Tanais is evidently based upon the supposition that this would be a simple and direct course along the coast of Germany and Scythia,—Polybius himself, in common with the other Greek geographers till a much later period, being wholly ignorant of the vast projection of the Cimbric peninsula, and the long circumnavigation that it involved,—of all which no trace is found in the extant notices of Pytheas. Notwithstanding this, some modern writers have supposed him to have entered the Baltic and penetrated as far as the mouth of the Vistula, which he erroneously supposed to be the Tanais. The only foundation for this highly improbable assumption is to be found in the fact that in a passage cited by Pliny (*H.N.*, xxxvii. 2, 35) Pytheas is represented as stating that amber was brought from an island called Abalus, distant a day's voyage from the land of the Guttones, a German nation who dwelt on an estuary of the ocean called Mentonomus, 6000 stadia in extent. It was a production thrown up by the waves of the sea, and was used by the inhabitants to burn instead of wood. It is not improbable that the "estuary" here mentioned really refers to the Baltic, the existence of which as a separate sea was unknown to all ancient geographers; but the obscure manner in which it is indicated, as well as the inaccuracy of the statements concerning the place from whence the amber was actually derived, both point to the sort of hearsay accounts which Pytheas might readily have picked up on the shores of the German Ocean, without proceeding farther than the mouth of the Elbe, which is supposed by Ukert

to have been the limit of his voyage in this direction. It must be observed also that amber is found on the western coasts of Germany, as well as in the Baltic, though not in equal abundance.

It is a very singular fact that no mention is found in any ancient writer, in connexion with the voyage of Pytheas, of the Cassiterides or Tin Islands, the exploration of which might naturally have been supposed to have been one of the chief objects of his voyage. It is indeed not impossible that the statements on this subject preserved to us from Timæus, who wrote less than a century after him, were derived from Pytheas, though there is no proof of this. The trade with those islands was probably at this period exclusively in the hands of the Phœnicians, but we know that at a later time a considerable portion of the supply was carried overland through Gaul to Massilia. Whether the voyage of Pytheas had any effect in contributing to bring about the diversion of this lucrative trade we have unfortunately no information.

Whatever uncertainty still hangs around all that has been transmitted to us concerning the actual explorations of Pytheas, it is certain that he had one merit which distinguished him from almost all his contemporaries: he was a good astronomer, and was one of the first who made observations for the determination of latitudes, among others that of his native place Massilia, which he fixed with remarkable accuracy, so that his result, which was within a few miles of the truth, was adopted by Ptolemy, and became the basis of his map of the Western Mediterranean. Pytheas was also the first among the Greeks who arrived at any correct notion of the tides, and not only indicated their connexion with the moon but pointed out their periodical fluctuations in accordance with the phases of that luminary. Other observations concerning the manners and customs of the inhabitants of these remote regions are ascribed to him that are undoubtedly correct and tend strongly to prove that he had himself really visited them. Among these are the gradual disappearance of various kinds of grain as one advanced towards the north; the use of fermented liquors made from corn and honey; and the habit of threshing out their corn in large covered barns, instead of on open threshing-floors as in Greece and Italy, on account of the want of sun and abundance of rain.

The fragments of Pytheas have been collected by Arvedson (Upsala, 1824) and by Fuhr (*De Pythea Massiliensi*, Darmstadt, 1835). Of the numerous treatises and dissertations on the subject see for those of earlier date Ukert's "Bemerkungen über Pytheas" (in vol. i. of his *Geog. d. Griechen u. Römer*, pp. 298-309), which contains an excellent summary of all that is known concerning the author and his work. The question has been also discussed by Sir G. C. Lewis, in his *Historical Survey of the Astronomy of the Ancients* (pp. 466-480, London, 1862), by Mr Bunbury, in his *History of Ancient Geography* (vol. i. chap. xv. sect. 2), and by Mr Elton, in his *Origins of English History* (London, 1882). A very elaborate but prolix and somewhat confused investigation of the whole subject will be found in Mullenhoff's *Deutsche Alterthums-kunde* (vol. i. pp. 211-497, Berlin, 1870). (E. H. B.)

PYTHON, a genus of gigantic snakes inhabiting the tropical parts of Africa and Asia, and known in some parts of the British possessions by the name of "rock-snakes." On account of their general appearance, beautifully-marked skin, large size, and similarity of habits they are frequently confounded with the true boas of the New World and misnamed "boa-constrictors." They differ from them, however, by having a double row of scutes under the tail, pits in the shields round the margins of the upper and lower jaws, and teeth in the intermaxillary bone.

Africa is inhabited by three species (*Python sebae*, *P. regius*, and *P. natalensis*), and Asia by two (*Python molurus* and *P. reticulatus*), the former of these two species being found on the continent of India and in Ceylon, the latter in the large islands of the Archipelago and in the Malayan Peninsula. In Australasia and New Guinea similar snakes occur, but they are of much smaller size and differ in essential structural characters from the rock-snakes. These latter are among the largest of living reptiles; although their dimensions and strength have been much exaggerated, specimens of 18 and 20 feet have been brought to Europe, and reliable statements of the occurrence of individuals which measured 30 feet are on record. Snakes of this size will easily overpower and kill one of the small species of deer or antelopes which abound in their native haunts, a sheep, or a good-sized dog; but the width of their mouth

would not permit them to swallow an animal larger than a half-grown sheep. The way in which they seize and kill their prey does not differ from that observed in num-

Python reticulatus (India).

erous other non venomous snakes: after having seized their victim, they smother it by constriction, throwing several coils of the body over and round it. In swallowing they always commence with the head; and, as they prey exclusively on mammals and birds, the hairs and feathers offer a considerable impediment to the passage through the narrow but distensible throat. The process of deglutition is therefore slow, although facilitated by the great quantity of saliva discharged over the body of the victim. During the time of digestion the snake is very lazy, and unwilling to move and to defend itself when attacked. At other times these animals are fierce enough, although always harmless to man if left unmolested. In captivity they seem to become used to those who attend upon them, but their apparent tameness is due rather to the depressing influence of a colder climate than to a change of their naturally excitable temper. Rock-snakes are mostly arboreal, and prefer localities in the vicinity of water to which animals resort for the purpose of drinking. They move, climb, and swim with equal facility. It has now been well established by observations on specimens in a state of nature as well as in captivity that the female rock-snake incubates her eggs for about two months, at the end of which period the young are hatched, and probably remain under the protection of the mother for a few weeks longer. The snake collects the eggs into a conical heap, round which she coils herself, entirely covering them so that her head rests in the centre on the top of the cone. In this position the animal remains without food throughout the whole period of incubation, and an increase of the temperature between the coils of the snake has been observed in every case.

PYX. See MINT, vol. xvi. p. 483.

Q

Q was written in Greek with the straight stroke vertical, ϟ, as in the Phœnician alphabet from which it was borrowed, and was called koppa, the equivalent of the Hebrew koph. It is found sparingly on some old inscriptions of Rhodes, of some of the Ægean islands, of Corinth and of Syracuse, and most frequently in the Chalcidian colonies of Sicily and Italy. But it was soon supplanted by kappa, and survived only in numeration as the representative of the number 90. It went to Rome with the Chalcidian alphabet of Cumæ, and was written at first with the vertical line; but the stroke soon became slant, so that the symbol got the form it still retains (Q).

There is a slight but real distinction of sound between the so-called palatal and velar *k*. The first is the ordinary *k*, for which the back of the tongue is raised against the back part of the hard palate. The second is produced by raising the tongue against the soft palate or *velum palati*, that is, rather farther back in the mouth. This sound has a tendency to be accompanied by a slight rounding of the lips; this causes an equally slight *w* sound after the *k*. It is probable that the velar *k* with this parasitic *w* was in use for a time in Greece, and that it was represented by the koppa; the symbol would otherwise have been totally unnecessary; also the koppa is generally followed by *u* or *o*, which, on this view, is natural. We know that in Greece *kw* must have been an intermediate sound between *k* and *p* in words where *k* was labialized, such as *ἐπομαι* from root *sak* (see under K). But this intermediate sound was not retained in the language: either the *w* was dropped and the sound reverted to *k*, or *p* was produced by the assimilating force of the *w*; therefore all need for a symbol koppa vanished. But in Latin the middle step remained, as in *sequor*; therefore the symbol was needed. But the parasitic sound became a complete *w*; and to denote this *v* was regularly written after the *q*. Therefore even in Latin the symbol was really otiose, for *kw* would have been quite sufficient, and did actually suffice for the Umbrian and Oscan, which never possessed the *q*. In old inscriptions we find *q* alone when the following vowel is *u*, as in *Mircurios*, *pegunia*. In later times, when *o* passed by weakening into *u*, a preceding *qu* was written *c*; thus *quom* became *cum*, to avoid the double *u* of *quum*. The *qu* of the Latin naturally passed on into the Romanic languages. It passed into the Teutonic languages in borrowed words, such as *quart*, but made its way into Teutonic words also; thus, in English, *cwén*, *cwellan* are now spelt *queen*, *quell*.

QUADRILATERAL, a military term applied to any combination of four fortresses mutually supporting each other, but especially to that of the four fortified towns of Mantua, Peschiera, Verona, and Legnago, the two former of which are situated on the Mincio and the two latter on the Adige. The real value of the Quadrilateral, which gave Austria such a firm hold on Lombardy, lay in the extraordinary natural strength of Mantua and in the readiness with which troops and supplies could be poured into Verona from the north.

See "The Quadrilateral," in the *Cornhill Magazine*, 1862; and Professor Malfatti, *Il Quadrilatero*, Milan, 1866.

QUADRUMANA. See **MAMMALIA**, vol. xv. p. 444, and **APÉ**, vol. ii. p. 148.

QUÆSTOR was the title of a Roman magistrate whose functions, at least in the later times of the republic, were mainly financial. The origin of the quæstorship is somewhat obscure, but on the whole it was probably instituted

simultaneously with the consulship in 509 B.C.¹ The number of the quæstors was originally two, but this was successively increased to four (in 421 B.C.), eight (in 267 or 241 B.C.), and by Sulla (in 81 B.C.) to twenty. Cæsar raised the number to forty (in 45 B.C.), but Augustus reduced it again to twenty, which remained the regular number under the empire. When the number was raised from two to four in 421 B.C. the office was thrown open to the plebeians, and it was the first office that was so opened. It was the lowest of the great offices of state, and hence it was regularly the first sought by aspirants to a political career. Towards the close of the republic, if not earlier, the successful candidate was bound to have completed his thirtieth year before he entered on office, but Augustus lowered the age to twenty-five. Originally the quæstors seem to have been nominated by the consuls independently, but later, perhaps from the fall of the decemvirs (449 B.C.), they were elected by the people assembled in tribes (*comitia tributa*) and presided over by a consul or another of the higher magistrates. The quæstors held office for one year, but, like the consuls and prætors, they were often continued in office with the title of proquæstor. Indeed it was a regular rule that the quæstor attached to a higher magistrate should hold office as long as his superior; hence, when a consul regularly presided over the city for one year, and afterwards as proconsul governed a province for another year, his quæstor also regularly held office for two years. Before the election of the quæstors the senate decided the duties to be undertaken by them, and after election these duties were distributed amongst the new quæstors either by lot or by the choice of the higher magistrates to whom a quæstor was assigned. A peculiar burden laid on the quæstors, not so much as an official duty, but rather as a sort of fee exacted from all who entered on the political career, was the paving of the high roads, for which Claudius substituted the exhibition of gladiatorial games. Various classes of quæstors may be distinguished according to the duties they had respectively to discharge. Up to 421 B.C. there were only two quæstors, and when fresh ones were added the two original quæstors were distinguished by the appellation of urban quæstors (*quæstores urbani*), doubtless because they were bound to remain in Rome during their term of office.

1. *The Urban Quæstors*.—Originally the duties of the quæstors, like those of the consuls, were of a general and undefined nature; specialization of function had not yet arisen—the consuls were simply the superior, the quæstors simply the inferior magistrates of the republic. From a very early time, however, the quæstors possessed criminal to the exclusion of civil jurisdiction. The very name "quæstor" (from *quærere*, "to search out") means "investigator," "inquisitor." In the code of the Twelve Tables they are designated *quæstores parricidii*, "inquisitors of parricide or murder";² and perhaps originally this was their full title, which was afterwards abbreviated into quæstors when their functions as criminal judges fell into the background. In addition to parricide or murder we can hardly doubt that all other crimes fell within the jurisdiction of the quæstors; political crimes only seem to have been excepted. The criminal jurisdiction of the quæstors appears

¹ Plutarch (*Popl.*, 12) states that the office was instituted by the first consul. Tacitus, on the other hand (*Ann.*, xi. 22), says that it dated from the time of the kings, but his ground is merely that they were mentioned in the *Lex Curiata* of the consul Brutus, which Tacitus assumes to have been identical with that of the kings.

² The etymology and original meaning of *parricidium* are doubtful. In the latter part of the word we have, of course, the same root as in *cædere*, "to kill," but whether or not the former part is from *pater*, "a father," or from the same root that we have in *per-peram*, *per-jurium*, is a moot point. Mommsen takes the latter view.

only to have terminated when towards the close of the republic trial by permanent courts (*questiones perpetuæ*) was extended to criminal cases.¹

The *questores* had also charge of the public treasury (*ærarium*) in the temple of Saturn, and this was in the later times of the republic their most important function. They kept the keys of the treasury and had charge of its contents, including not only coin and bullion but also the military standards and a large number of public documents, which in later times comprised all the laws as well as the decrees of the senate. Their functions as keepers of the treasury were withdrawn from the urban *questores* by Augustus and transferred to other magistrates, but the office itself continued to exist into the 3d century, though as to the nature of the duties attached to it we have little or no information.

2. *The Military Questores*.—These were instituted in 421 B.C., when two new *questores* were added to the original two. They never had a distinctive appellation like that of the urban *questores*, from whom, however, they were clearly distinguished by the fact that, while the urban *questores* did not stand in a special relation of subordination to any particular magistrate, a non-urban *questor* was regularly assigned as an indispensable assistant or adjutant to every general in command, whose name or title the *questor* usually added to his own.² Originally they were the adjutants of the consuls only, afterwards of the provincial prætors, and still later of the proconsuls and proprætors. The dictator alone among military commanders had no *questor*, because a *questor* would have been a limitation to his powers. The governor of Sicily had two *questores*; all other governors and commanders had but one. Between the *questor* and his superior a close personal relation, analogous to that between a son and his father, existed, and was not severed when their official connexion ceased. Not till the close of the republic do cases occur of a *questor* being sent to a province invested with prætorial and even consular powers; in one case at least the *questor* so sent had a second *questor* placed under him. The duties of the military *questor*, like those of the treasury *questor*, were primarily financial. Moneys due to a provincial governor from the state treasury were often, perhaps regularly, received and disbursed by the *questor*; the magazines seem to have been under his charge; he coined money, on which not unfrequently his name appears alone. The booty taken in war was not necessarily under the control of the *questor*, but was dealt with, especially in later times, by inferior officers called *præfecti fabrum*. But, though his duties were primarily financial, the *questor* was after all the chief assistant or adjutant of his superior in command, and as such he was invested with a certain degree of military power; under the republic his military rank was superior to that of the legates, though under the empire this relation was reversed. When the general left his province before the arrival of his successor he usually committed it to the care of his *questor*, and, if he died or was incapacitated from naming his successor, the *questor* acted as his representative. Unlike the urban *questor*, the military *questor* possessed not a criminal but a civil jurisdiction corresponding to that of the *ædiles* at Rome.

3. *The Italian Questores*.—The subjugation of Italy occasioned the institution (in 267 B.C.) of four new *questores*, who appear to have been called *questores classici* because they were originally intended to superintend the building of the fleet (*classis*); their functions, however, are very imperfectly known. Though no doubt intended to assist the consuls, they were not subordinated (like the military *questores*) to a special consul. They were stationed at Ostia, at Cales in Campania, and in Gaul about the Padus (Po). The station of the fourth is not mentioned; perhaps it was Lilybæum in Sicily.

QUAGGA, or COUAGGA, an animal of the genus *Equus* (see HORSE, vol. xii. p. 175), nearly allied to the zebra, which formerly was met with in vast herds on the great plains of South Africa between the Cape Colony and the Vaal river, but now, in common with most of the larger wild animals of that region, becoming extremely scarce, owing to the encroachments of European civilization. In length of ears and character of tail it more resembles the horse than it does the ass, although it agrees with the latter in wanting the small bare callosity in the inner side of the hind leg, just below the hock, characteristic of the horse. The colour of the head, neck, and upper parts of

the body is reddish-brown, irregularly banded and marked with dark brown stripes, stronger on the head and neck and gradually becoming fainter until lost behind the shoulder. There is a broad dark median dorsal stripe. The under surface of the body, the legs, and tail are nearly white, without stripes. The crest is very high, surmounted by a standing mane, banded alternately brown and white. Though never really domesticated, quaggas have occasionally been trained to harness. The accompanying figure is

Quagga.

reduced from a painting made from one of a pair which were driven in Hyde Park by Mr Sheriff Parkins in the early part of the present century. The name is an imitation of the shrill barking neigh of the animal, "ouag-ga, ouag-ga," the last syllable very much prolonged. It must be remembered, however, in reading books of African travel that the same word is very commonly applied by hunters to another and more completely striped species, called by zoologists Burchell's zebra.

QUAIL (Old French *Quaille*, Mod. French *Caille*, Italian *Quaglia*, Low Latin *Quaquila*, Dutch *Krakkel*, and *Kwartel*, German *Wachtel*, Danish *Vagtel*), a very well known bird throughout almost all countries of Europe, Asia, and Africa,—in modern ornithology the *Coturnix communis* or *C. dactylisonans*. This last epithet was given from the peculiar three-syllabled call-note of the cock, which has been grotesquely rendered in several European languages, and in some parts of Great Britain the species is popularly known by the nickname of "Wet-my-lips" or "Wet-my-feet." The Quail varies somewhat in colour, and the variation is rather individual than attributable to local causes; but generally the plumage may be described as reddish-brown above, almost each feather being transversely patched with dark brown interrupted by a longitudinal stripe of light buff; the head is dark brown above, with three longitudinal streaks of ochreous-white; the sides of the breast and flanks are reddish-brown, distinctly striped with ochreous-white; the rest of the lower parts are pale buff, clouded with a darker shade, and passing into white on the belly. The cock, besides being generally brighter in tint, not unfrequently has the chin and a double-throat band of reddish or blackish-brown, which marks are wanting in the hen, whose breast is usually spotted. Quails breed on the ground, as all gallinaceous birds commonly do, and lay from nine to fifteen eggs of a yellowish-white, blotched and spotted with dark brown. Though essentially migratory by nature, not a few Quails pass the winter in the northern hemisphere and even in Britain, and many more in southern Europe. In March and April they cross the Mediterranean from the south on the way to their breed-

¹ It is often supposed that the *questores parricidii* were an old magistracy quite distinct from the ordinary *questores*. For the identification of the two, see Mommsen, *Römisches Staatsrecht*, ii., pt. 1, p. 506.

² Thus Cicero speaks of the *provincia consularis* of the *questor*, and we find *questor Cn. Pompei*, &c.

ing homes in large bands, but these are said to be as nothing compared with the enormous flights that emigrate from Europe towards the end of September. During both migrations immense numbers are netted for the market, since they are almost universally esteemed as delicate meat. On capture they are placed in long narrow and low cages, darkened to prevent the prisoners from fighting, and, though they are often so much crowded as to be hardly able to stir, the loss by death that ensues is but trifling. Food, usually millet or hempseed, and water are supplied in troughs hung in front, and thus these little birds are transported by tens of thousands from the shores of the Mediterranean for consumption in the most opulent and populous cities of Europe. The flesh of Quails caught in spring commonly proves dry and indifferent, but that of those taken in autumn, especially when they have been kept long enough to grow fat, as they quickly do, is excellent. In no part of the British Islands at present do Quails exist in sufficient numbers to be the especial object of sport, though there are many places in which a few, and in some seasons more than a few, yearly fall to the gun. When made to take wing, which is not always easily done, they rise with great speed, but on such occasions they seldom fly far, and no one seeing them only thus would be inclined to credit them with the power of extensive migration that they possess, though this is often overtaxed, and the birds in their transmarine voyages frequently drop exhausted into the sea or on any vessel that may be in their way. In old days they were taken in England in a net, attracted thereto by means of a Quail-call,—a simple instrument,¹ the use of which is now wholly neglected,—on which their notes are easily imitated.

Five or six other species of the restricted genus *Coturnix* are now recognized; but the subject of the preceding remarks is generally admitted to be that intended by the author of the book of Exodus (xvi. 13) as having supplied food to the Israelites in the wilderness, though a few ornithological writers have thought that bird to have been a SAND-GROUSE (*q.v.*). In South Africa and India allied species, *C. delegorguii* and *C. coromandelica*, the latter known as the Rain-Quail, respectively occur, as well as the commoner one, which in Australia and Tasmania is wholly replaced by *C. pectoralis*, the Stubble-Quail of the colonists. In New Zealand another species, *C. novæ-zelandæ*, was formerly very abundant in some districts, but is considered to have been nearly if not quite extirpated within the last twenty years by bush-fires. Some fifteen or perhaps more species of Quails, inhabiting the Indian and Australian Regions, have been separated, perhaps unnecessarily, to form the genera *Synæcus*, *Perdicula*, *Excalfatoria*, and so forth; but they call for no particular remark.

America has some fifty or sixty species of birds which are commonly deemed Quails, though by some authors placed in a distinct Family or Sub-family *Odontophorinæ*.² The best known is the Virginian Quail, or Colin, as it is frequently called—that being, according to Hernandez, its old Mexican name. It is the *Ortyx virginianus* of modern ornithology, and has a wide distribution in North America, in some parts of which it is known as the "Partridge," as well as by the nickname of "Bob-White," aptly bestowed upon it from the call-note of the cock. Many attempts have been made to introduce this bird to England (as indeed similar trials have been made in the United States with Quails from Europe); but, though it has been turned out by hundreds, and has been frequently known to breed after liberation, its numbers rapidly diminish until it wholly disappears. The beautiful tufted Quail of Cali-

fornia, *Lophortyx californica*, has also been tried in Europe without success. All these American Quails or Colins seem to have the habit of perching on trees, which none of the Old-World forms possess.

Interesting from many points of view as is the group of Birds last mentioned, there is another which, containing a score of species (or perhaps more) often termed Quails or Button-Quails, is of still greater importance in the eyes of the systematist. This is that comprehended by the genus *Turnix*, or *Hemipodius* of some authors, the anatomical structure of which removes it far from the genera *Coturnix*, *Ortyx*, and their allies, and even from any of the normal *Gallinæ*. Prof. Huxley, as already stated (*ORNITHOLOGY*, vol. xviii. p. 36), would regard it as the representative of a generalized stock from which the *Charadriomorphæ* and *Alectoromorphæ*, to say nothing of other groups, have sprung. Want of space prevents our here dwelling upon these curious birds. One species, *T. sylvatica*, inhabits Barbary and southern Spain, and under the name of Andalusian Hemipode has been included (though on evidence not wholly satisfactory) among British Birds as a reputed straggler. The rest are natives of various parts of the Ethiopian, Indian, and Australian Regions. It is characteristic of the genus *Turnix* to want the hind toe; but the African *Ortyxcelus* and the Australian *Pedionomus* which have been referred to its neighbourhood have four toes on each foot, and, since nothing is known of the anatomy or habits of the first and but little of those of the second,³ their position must at present be considered doubtful.

(A. N.)

QUAKERS. The Quakers, or, as they call themselves, the Society of Friends, are a body of Christians small in number but presenting several features of interest. To the student of ecclesiastical history they are curious as exhibiting a form of Christianity widely aberrant from the prevalent types, and as a body of worshippers without a creed, a liturgy, a priesthood, or a sacrament; to the student of social science they are interesting as having given to women an almost equal place with men in their church organization, and as having attempted to eliminate war, oaths, and litigation from their midst. The student of English constitutional history will observe the success with which they have, by the mere force of passive resistance, obtained from the legislature and the courts indulgence for all their scruples and a recognition of the legal validity of their customs; whilst to the student of American history the Quakers will ever be remarkable for the prominent part they played in the colonization of New Jersey and Pennsylvania.

History.—The history of Quakerism in England may conveniently be divided into four periods:—(1) from the first preaching of Fox in 1648 to the establishing of a church organization in 1666; (2) from that date to the Revolution of 1688; (3) from the Revolution to 1835; and (4) from 1835 to the present time.

1. George Fox (*q.v.*), the son of a weaver of Drayton in Leicestershire, was the founder of the Quakers. He began to preach in 1648, and in a few years gathered around him a great body of followers and a considerable number of itinerant preachers like himself, who zealously promulgated his doctrines. Amongst these Edward Burrough was one of the most remarkable. In 1655 these preachers numbered seventy-three. Fox and his fellow-preachers spoke whenever opportunity offered—sometimes in churches.

³ Col. Legge's observations on the habits of *Pedionomus* in the Zoological Society's *Proceedings* (1869, pp. 236–238) would seem to shew a Limicoline affinity. Garrod in the same work (1873, p. 34) figured the skull as that of a Turnicine, in which view Forbes acquiesced (*Ibis*, 1882, pp. 389, 431); but against it Col. Legge immediately protested (*tom. cit.*, p. 610).

¹ One is figured in Rowley's *Ornithological Miscellany* (ii. p. 363).

² They form the subject of a monograph in folio by Gould, published between 1844 and 1850.

sometimes in barns, sometimes at market-crosses. There is some evidence to show that the arrangement of this mission, as it would now be called, rested mainly with Fox, and that the expenses of it and of the foreign missions were borne out of a common fund. Margaret Fell, the wife and afterwards the widow of Judge Fell—who subsequently married George Fox—opened her house at Swarthmore Hall, near Ulverston, to these preachers, and probably contributed largely to the common fund from which the expenses were paid. Fox's teaching was primarily a preaching of repentance; and he and his friends addressed vast congregations much as Wesley and Whitefield did at a later date. But his teaching had certain marked peculiarities—especially his insistence on the universality and sufficiency of the light of God's Spirit. He regarded the work in which he was engaged as in no wise the founding of a new sect or society, but, to use his own words, as "the appearance of the Lord's everlasting truth, and breaking forth again in His eternal power in this our day and age in England." Such teaching and such views necessarily brought Fox and his friends into direct conflict with all the religious bodies of England, and they were continually engaged in strife with the Presbyterian ministers who then filled the pulpits of English churches, with the Independents, with the Baptists, with the Episcopal Church, and with the wilder sectaries, like the Fifth Monarchy men, the Ranters, the Seekers, and the Muggletonians. This strife was conducted on both sides with a zeal and an acerbity of language not consonant with our present notions of decorum. The movement was accompanied, too, by most of those physical symptoms which usually go with vehement appeals to the conscience and the emotions of a rude multitude. The trembling amongst the listening crowd caused or confirmed the name of Quakers given to the body: men and women sometimes fell down and lay grovelling on the earth and struggling as if for life. But the Quaker preachers seem not to have encouraged these manifestations, but rather to have sought to assuage them by such reasonable means as carrying the affected to bed or administering a cordial or medicine.

Some of the early Quakers indulged in eccentricities and extravagances of no measured kind. Some travelled and preached naked or barefoot or dressed in sackcloth; others imitated the Hebrew prophets in the performance of symbolical acts of denunciation or warning; even the women in some cases distinguished themselves by the impropriety and folly of their conduct. In some cases religious excitement seems to have produced or been attended by insanity, and the aberrations of Naylor and Ibbot can only be attributed to that cause. For, though not altogether free from acts of fanaticism, the Quaker leaders discouraged and disowned the grosser acts of enthusiasm.

The activity and zeal of the early Quakers were not confined to England; they passed into Scotland and Ireland. Fox and others travelled to America and the West Indian Islands; another reached Jerusalem, and testified against the superstition of the monks; Mary Fisher, "a religious maiden," visited Smyrna, the Morea, and the court of Mohammed IV. at Adrianople; others made their way to Rome; two women suffered imprisonment from the Inquisition in Malta; two men passed into Austria and Hungary; and William Penn, George Fox, and others preached Quakerism in Holland and Germany.

As early as 1652 meetings of the followers of Fox, calling themselves at first the Children of Light, gathered together in various places in England, and were soon established in considerable numbers. The meetings at Bristol were often attended by from three to four thousand people.

2. The second period in the history of Quakerism is marked by the introduction into the body, hitherto unorganized, of an organization and a discipline principally due to the mind and energy of Fox, by a more scholarly and learned air given to the Quaker productions by the writings of William Penn and Robert Barclay, and by the part which the Quakers played in the colonization of New Jersey and of Pennsylvania. It is not wonderful that the introduction of an organization and a discipline met with great opposition amongst a people taught to believe that the inward light of each individual man was the only true guide for his conduct. The project met with some opposition at the time, and at a later period (1683), from persons of considerable reputation in the body. Wilkinson, Rogers, Story, and others raised a party against Fox as regards the management of the affairs of the society, and asserted that the meetings for discipline which had been established were useless, and that every man ought to be guided by the Spirit of God in his own mind, and not to be governed by rules of man. They drew a considerable following away with them, but the greater number adhered to their original leader.

Robert BARCLAY (*q.v.*), a Scotsman of family, who had received a polite education, principally in France, joined the Quakers about 1666, and William PENN (*q.v.*) joined the body about two years later. The Quakers had always been active controversialists, and a great body of tracts and papers was issued by them; but hitherto they had not been of much account in a literary point of view. Now the writings of Barclay, especially his celebrated *Apology for the True Christian Divinity* (1675), published by him in Latin and English, and the works of William Penn (amongst which his *No Cross no Crown* was one of the best known) gave to the Quaker literature a more logical and a more scholarly aspect.

One peculiarity of the conduct of the Friends down to the Revolution of 1688, and more or less down to the present time, must not be overlooked. They were essentially non-political. They opposed the most dogged personal and individual resistance to what they thought wrong; but they never attempted by combination or otherwise to exert political influence. "Keep out of the powers of the earth" was Fox's exhortation; and, when in 1688 a discussion was introduced into the yearly gathering of the body on the choice of parliament men, Fox strenuously opposed the introduction of politics into the meetings of his followers.

During the whole time between the rise of the Quakers and the passing of the Toleration Act they were the objects of an almost continuous persecution, which they endured with extraordinary constancy and patience. In 1656 Fox computed that there were seldom less than a thousand in prison, and it has been asserted that between 1661 and 1697 13,562 Quakers were imprisoned, 152 were transported, and 338 died in prison or of their wounds. Having come into being after the death of Charles I., the Quakers first endured persecution under the Parliament and then under Cromwell. In 1645 an ordinance of the Parliament had made the directory of the Westminster divines obligatory; and ordinances of the years 1646 and 1648 were passed for the preventing of blasphemies and heresies, which comprehended under these hard names some doctrines afterwards promulgated by the Quakers, as that the two sacraments of baptism and the Lord's supper are not commanded by the word of God, and that the use of arms for defence, be the cause ever so just, is unlawful. Furthermore these or other ordinances of the Parliament placed the decision of questions as to tithes in the hands of the justices of the peace. The instrument of government under which Cromwell assumed power as the Lord Protector had held out a promise of protection in the exercise of their religion to "such as professed faith in God by Jesus Christ" (art. 37); and the Protector himself, in a speech addressed to Parliament on the 12th September 1654, had declared liberty of conscience to be a natural right; nevertheless the Quakers found that they were still the subjects of bitter persecution. They were sometimes dealt with under the ordinances already referred to, sometimes as Sabbath-breakers because they

travelled to their meetings for worship, sometimes as disturbers of the clergy in their office because they spoke in churches, sometimes as guilty of breaches of the peace because they preached in streets or markets, sometimes for refusing to pay tithes, sometimes for refusing to take off their hats, sometimes for refusing to swear. So matters remained till the Restoration of Charles II., when the publication from Breda of his declaration for liberty of conscience again raised hopes of ease in the hearts of the Friends. But these hopes were again destined to disappointment. The laws under which the Quakers were persecuted during the revived Stuart period were (1) the common law, (2) the old legislation in ecclesiastical matters which was revived on Charles's accession, (3) the special legislation of the period, and (4) the ecclesiastical laws as administered by the ecclesiastical courts. In the first class was the general law as to breakers of the peace; in the second class may be mentioned the statute of 6 Hen. VIII. by which imprisonment was appointed as a punishment for non-payment of tithes, the statute of Elizabeth imposing the oath of supremacy, the Act of Uniformity passed in the first year of Elizabeth, the Acts of the 23rd and 29th years of the same queen which imposed fines and penalties for non-attendance of church and the statute of the 35th year of Elizabeth by which an obstinate offender in that matter was made a felon without benefit of clergy, and, lastly, the statute of 3 James I. imposing the oath of allegiance. (3) The special legislation during this period under which the Quakers suffered included (a) a statute 13 & 14 Car. II. c. 1, especially directed against them and punishing their refusal to take an oath, or the taking part in assemblies for worship, with fine, and a second conviction with an obligation to abjure the realm, or transportation to any of the king's plantations; (b) the Act of Uniformity (13 & 14 Car. II. c. 4), more stringent than that of Elizabeth; (c) the Five-Mile Act passed in 1665 (17 Car. II. c. 4); and, lastly, the Conventicle Act of 1670 (22 Car. II. c. 1). (4) The ecclesiastical courts, on the return of the Stuarts, were restored to their former vigour, and Quakers were continually proceeded against in them for non-payment of tithes, oblations, and other church claims, and also for non-attendance at the parish churches, and for contempt of the discipline and censures of the church. Many of their body were accordingly excommunicated, and under the writ *de excommunicato capiendo* confined to prison.

The passing of the Conventicle Act gave fresh vigour to the persecution of Dissenters. But, on 15th March 1671-72, King Charles II. issued his declaration for suspending the penal laws in matters ecclesiastical, and shortly afterwards by pardon under the great seal released above four hundred Quakers from prison, remitted their fines, and released such of their estates as were forfeited by *præmunire*. The dissatisfaction which this exercise of the royal prerogative created induced the king in the following year to recall his proclamation, and the sufferings of the Quakers revived; and, notwithstanding representations and appeals to King Charles II., the persecution continued throughout his reign. On the accession of James II., the Quakers addressed him with some hope from his known friendship for William Penn, and presented to him a list of the numbers of their members undergoing imprisonment in each county, amounting in all to fourteen hundred and sixty. King James not long afterwards directed a stay of proceedings in all matters pending in the Exchequer against Quakers on the ground of non-attendance on national worship. In 1687 came the king's celebrated declaration for liberty of conscience, and in the following year the Revolution, which put an end to all persecution of the Quakers, though they remained for many years liable to imprisonment for non-payment of tithes, and though they long laboured together with other Dissenters under various disabilities—the gradual removal of which is part of the general history of England.

The Toleration Act was by no means the only legislation of the reign of William and Mary which brought ease to the Quakers. The legislature early had regard to their refusal to take oaths; and from 1689 to a very recent date numerous enactments have respected the peculiar scruples of the Friends. This special legislation may be conveniently studied in Davis's *Digest of Legislative Enactments relating to Friends* (Bristol, 1820).

3. With the cessation of persecution in 1689 the

zeal of the Quaker body abated. Foreign missions had no existence except in the occasional travels of some wandering minister. The notion that the whole Christian church would be absorbed in Quakerism, and that the Quakers were in fact the church, passed away; and in its place grew up the conception that they were "a peculiar people" to whom had been given a clearer insight into the truths of God than to the professing Christian world around them, and that this sacred deposit was to be guarded with jealous care. Hence the Quakerism of this period was mainly of a traditional kind: it dwelt with increasing emphasis on the peculiarities of dress and language which tended to shut Quakers off socially from their fellow-men; it rested much upon discipline, which developed and hardened into rigorous forms; and the correction or exclusion of its members was a larger part of the business of the body than the winning of converts either to Christianity or to Quakerism.

Excluded from political life by the constitution of the country, excluding themselves not only from the frivolous pursuits of pleasure but from music and art in general, with no high average of literary education (though they produced some men of eminence in medicine and science, as Dr Fothergill and Dr Dalton), the Quakers occupied themselves largely with trade, the business of their society, and the calls of philanthropy. In the middle and latter part of last century they founded several institutions for the more thorough education of their children, and entered upon many philanthropic labours.

During this period Quakerism was sketched from the outside by two very different men. Voltaire (*Dictionnaire Philosophique*, s.v. "Quaker," "Toleration") has described the body, which attracted his curiosity, his sympathy, and his sneers, with all his brilliance. Clarkson (*Portraiture of Quakerism*) has given an elaborate and sympathetic account of the Quakers as he knew them when he travelled amongst them from house to house on his crusade against the slave trade.

4. It cannot be denied that the theology of Quakerism had become somewhat mystic and quietist during the long period we have just considered. About the year 1826 an American Quaker named Hicks (*q.v.*) openly denied the divinity of Christ, depreciated the value of the Scriptures, and recognized no other Saviour than the inward light. A large body of the American Quakers followed him, and still maintain a separate existence. It was this movement which led to a counter movement in England, known in the Quaker body as the Beacon controversy, from the name of a book published in 1835, advocating views more nearly akin to those known as evangelical than were held by many Quakers. A considerable discussion ensued, and a certain number of the Friends holding these more evangelical doctrines departed from the parent stock, leaving, however, behind them many influential members of the society who strove to give a more evangelical tone to the Quaker theology. Joseph John Gurney, by his various writings (some published before 1835), was the most prominent actor in this movement. This period has also been marked, especially within the last few years, by some revival of aggressive action, and Quakers have taken far more part in the teaching in Sunday schools, in the preaching of the gospel to the poor, and in the establishment of foreign missions than in the period immediately preceding. In 1847 an association was established to promote Sunday schools in the body; in 1859 a Friends' foreign mission was established; and the Quakers have now a few regular labourers in Madagascar, India, Syria, and Constantinople.

Other causes have been at work modifying the Quaker body. The repeal of the Test Act, the admission of

Quakers to parliament, the establishment of the university of London, and more recently still the opening to Dissenters of Oxford and Cambridge, have all operated on the body. It has almost entirely abandoned its peculiarities of dress and language; the cultivation of music and the other arts is no longer discouraged except by a very few; and literary and scientific tastes have been cultivated all the more because their attention was not preoccupied with the love of field sports or of dancing. In fact a number of men either Quakers or of Quaker origin and proclivities, large in proportion to the small body with which they are connected, occupy positions of influence in English society, and carry with them, not the full body of Quaker doctrine, but some leaven of Quaker habits and thoughts and feelings.

Doctrine.—It is not easy to state with certainty the doctrines of a body which has never adopted any creed, and whose views have undoubtedly undergone from time to time changes more or less definite. But the accepted writings of its members and the statements as to doctrine contained in the *Book of Christian Discipline* of the society furnish materials.

The most characteristic doctrine of Quakerism is undoubtedly this—that there is an immediate revelation of the Spirit of God to each individual soul, that this light is universal and comes both to the heathen and the Christian, and thereby the love and grace of God towards mankind are universal. It is almost needless to call attention to the direct antithesis between this doctrine of the Quakers and the various doctrines of election held by the Puritans, so that, if Quakerism be called the climax of Puritanism, it is so only as the rebound is the climax of the wave. From the doctrine of the sufficiency of the inward light proceed several other of the peculiar views of Quakers. They have denied the necessity and abstained from the practice of the sacraments of baptism and the Lord's supper. The one baptism, says Barclay (12th proposition), "is a pure and spiritual thing, to wit, the baptism of the spirit and fire . . . of which the baptism of John was a figure which was commanded for a time, and not to continue for ever." "The communion of the body and blood of Christ," says the same author (13th proposition), "is inward and spiritual, which is the participation of his flesh and blood by which the inward man is daily nourished in the hearts of those in whom Christ dwells, of which things the breaking of bread by Christ with his disciples was a figure."

But not merely do the Quakers dispense with the sacraments; they exist without any priesthood or regular or ordained ministry; they allow the liberty of unlicensed preaching and prayer to every member of their society in their assemblies, and those in whom the body recognizes the true gifts are publicly acknowledged as ministers. But by this act they attain to no greater power in the society than they possessed before. By the strength and power of the light of God, says Barclay in his 10th proposition, "every true minister of the gospel is ordained, prepared, and supplied in the work of the ministry; and by the leading, moving, and drawing thereof ought every evangelist and Christian pastor to be led and ordered in his labour and work of the gospel both as to the place where, the persons to whom, and as to the times when he is to minister."

The Quakers not only have no stated ministry, but they hold that no form of worship is so good as a patient waiting upon God in silence "by such as find no outward ceremony, no observations, no words, yea not the best and purest words, even the words of Scripture, able to satisfy their weary and afflicted souls." Hence, although permitting addresses from their members, they sit frequently

silent both in family worship and in their meetings. Of late years, however, in some places passages from the Bible are read in their meetings for worship. Furthermore the Quakers maintain the equal right of women with men to preach and pray in their assemblies; and they cite the four daughters of Philip who prophesied, and other women who are mentioned in the New Testament as having laboured much in the Lord, as showing that their practice is in accord with that of the early church.

Refusing to acknowledge the ministry of the Established Church, and holding that they could thus best testify to "the spiritual reign and government of Christ," the Quakers refused to pay all church rates, tithes, and other ecclesiastical demands. To the year 1875 they maintained the same objection against tithe-rent charge, and then abandoned it.

The Quakers deny the lawfulness for a Christian of all war, defensive or otherwise, and have always refused, often at the expense of much suffering, to take any part in military matters; they equally deny the lawfulness for a Christian man to take any oath, even in a court of justice, and the law of England has long recognized their affirmations as giving validity to their evidence; they have denied themselves the cultivation of music, attendance at the theatres, and hunting, shooting, and field sports generally as vain amusements inconsistent with the gravity and seriousness of Christian life; they have insisted on the duty of using language not only free from that profanity which was so common until lately but stripped of all flattery and purged of all dross of heathenism; they enforced the duty of plainness of dress and of excluding from it, and from the modes of salutation and address, everything calculated to satisfy vanity.

The result of these doctrines on Quaker manners was notorious, and proved a continual source of objection to them on the part of their fellow-men, and frequently led to persecutions. They adopted the singular number in addressing a single individual, however exalted; and the "thou" and "thee" used to a magistrate or a judge was often a cause of great irritation. They refused to say "good night," "good morrow," or "good speed"; they adopted a numerical nomenclature for the months of the year and the days of the week. They refused to bow or to remove their hats, and for this they suffered much. They forbore the drinking of healths, not merely as a vanity, but as "a provocation to drink more than did people good." They adopted a remarkable simplicity in their marriages and their funerals. They used also great plainness in their houses and furniture and in their dress; and, by their tenaciously adhering to forms of attire which had fallen into disuse, their dress both for men and women became antique and peculiar, and Quakers were easily recognized as such by the garments they wore. Further more they discarded the usual symbols of grief on the death of their relations.

One point of morality on which the Friends have long insisted deserves notice. They require their members who may have been released from their debts by bankruptcy or composition, when able to pay their debts in full, to do so notwithstanding their legal discharge.

In the great doctrines of Christianity embodied in the apostles' creed the Quakers are in accord with their fellow-Christians: they believe in the Father, Son, and Holy Spirit, in the atonement by Christ, and in sanctification by the Spirit; they receive and believe the Scriptures as proceeding from the Spirit of God. A letter addressed by George Fox and others to the governor of Barbados in 1671 (*Journal*, 1st ed., p. 358), and the "General Advice"

¹ See Thomas Ellwood's *Journal* for an account of his sufferings in this matter, at once pathetic and ludicrous.

in the Book of Discipline, may usefully be consulted on this point.

Organization and Discipline.—The duty of watching over one another for good was insisted on by the early Friends, and has been embodied in a system of discipline. Its objects embrace (a) exhortation and admonition to those who walk contrary to the standard of Quaker ethics, and the exclusion of obstinate or gross offenders from the body, and as incident to this the hearing of appeals from individuals or meetings considering themselves aggrieved; (b) the care and maintenance of the poor and provision for the Christian education of their children, for which purpose the society has established numerous boarding schools in different parts of the country; (c) the amicable settlement of "all differences about outward things," either by the parties in controversy or by the submission of the dispute to arbitration, and the restraint of all proceedings at law between members except by leave; (d) the recognition of ministers as such; (e) the cognizance of all steps preceding marriage according to Quaker forms; (f) the registration of births, deaths, and marriages; (g) the issuing of certificates or letters of approval granted to ministers travelling away from their homes, or to members removing from one meeting to another; and (h) the management of the property belonging to the society. The present organization of the Quaker church is essentially democratic—it has not and never had any president or head; and in theory every person born of Quaker parents is a Quaker and entitled to take part in all the general assemblies of the body. The members are grouped together in a series of subordinated meetings which recall to the mind the Presbyterian model. The unit is known as a "particular meeting"; next in order comes "the monthly meeting," usually embracing several particular meetings called together, as its name indicates, monthly; then "the quarterly meeting," embracing several monthly meetings; and lastly "the yearly meeting," embracing the whole of Great Britain. Representatives are sent from each inferior to each superior meeting; but all Quakers may attend and take part in any of these meetings. This system is double, each meeting of "men Friends" having its counterpart in a meeting of "women Friends"; and they usually meet at the same time, and join together in the devotional gatherings which take place before or after the meetings for discipline. The mode of conducting these meetings is noteworthy. There is no president, but only a secretary or clerk; there are no formal resolutions; and there is no voting. The clerk ascertains what he considers to be the judgment of the assembly, and records it in a minute.

The offices known to the Quaker body are—(1) that of minister; (2) of elder, whose duty it is "to encourage and help young ministers, and advise others as they in the wisdom of God see occasion"; and (3) overseers to whom is especially entrusted that duty of Christian care for and interest in one another which Quakers recognize as obligatory in all the members of a church. These officers hold from time to time meetings separate from the general assemblies of the members.

This present form both of organization and discipline has been reached only by a process of development. The quarterly or general meetings seem to have been the first union of separate congregations. In 1666 Fox established monthly meetings. In 1672 was held the first yearly meeting in London. In 1675 certain "canons and institutions" were issued to the quarterly meetings. In 1727 elders were first appointed. In 1752 overseers were added; and in 1737 the right of children of Quakers to be considered as Quakers was fully recognized. From

these dates it is obvious that the last century saw a vigorous development of the disciplinary element in Quakerism; it was probably the time of greatest rigour as regards external matters and of the greatest severity in punishing so-called delinquencies. In Aberdeen the meeting entered on their minutes an elaborate description of what was and what was not to be endured in the dress of men and women; and York quarterly meeting was so disturbed at the presence of young women in long cloaks and bonnets that they were ordered to take advice before coming to York, and one monthly meeting directed that those young women who intended to go to York were to appear before their own meeting "in their clothes that they intend to have on at York."

Of late years the stringency of the Quaker discipline has been relaxed: the peculiarities of dress and language have been abandoned; marriage with an outsider has ceased to be a certain ground for exclusion from the body; and, above all, many of its members have come to "the conviction, which is not new, but old, that the virtues which can be rewarded and the vices which can be punished by external discipline are not as a rule the virtues and the vices that make or mar the soul" (Hatch, *Bampton Lectures*, 81).

The Quakers maintain that their system of church government and of discipline is in close accordance with that of the early church. That it has some great differences cannot be denied, especially when we think of baptism and the Lord's supper; that it has some important points of likeness, especially in the care of each member for the others and in the maintenance of the poor, is equally certain. The portraiture of the early Christian church recently drawn by Dr Hatch in his *Bampton Lectures* is in many respects likely to recall the lineaments of Quakerism.

Philanthropic Interests.—A genuine vein of philanthropy has always existed in the Quaker body. In nothing has this been more conspicuous than in the matter of slavery. George Fox and William Penn laboured to secure the religious teaching of slaves. As early as 1676 the assembly of Barbados passed "An Act to prevent the people called Quakers from bringing negroes to their meetings." John Woolman¹ laboured amongst the Quakers of America for the liberation of the slaves with the most winning tenderness. The Quakers were the first Christian body that purged themselves of the stain of dealing in slaves. As early as 1780 not a slave was owned by any Friend in England or America with the knowledge and consent of the society. In 1783 the first petition to the House of Commons for the abolition of the slave trade and slavery went up from the Quakers; and throughout the long agitations which ensued before that prayer was granted the society took an active and prominent part.

In 1798 Lancaster opened his first school for the education of the poor; and the cause of unsectarian religious education found in the Quakers steady support. They have taken also an active part in Sir Samuel Romilly's efforts to ameliorate the penal code; in prison reformation (1813), with which the name of Elizabeth Fry is especially connected; in the efforts to ameliorate the condition of lunatics in England (the Friends' Retreat at York, founded in 1792, having been remarkable as an early example of kindly treatment of the insane); and in many other philanthropic movements.

One thing is noteworthy in Quaker efforts for the education of the poor and philanthropy in general: whilst

¹ Woolman's *Journal* and *Works* are remarkable. He had a vision of a political economy to be based not on selfishness but on love, not on desire but on self-denial.

they have always been Christian in character, they have not to any considerable extent been used as a means of bringing proselytes within the body.

Quakerism in Scotland.—Quakerism was preached in Scotland very soon after its rise in England; but in the north and south of Scotland there existed independently of and before this preaching groups of persons who were dissatisfied with the national form of worship and met together in silence for devotion. They naturally fell into this society. In Aberdeen the Quakers took considerable hold, and were there joined by some persons of influence and position, especially Alexander Jaffray, some time provost of Aberdeen, and Colonel David Barclay of Ury and his son Robert, the author of the *Apology*. Much light has been thrown on the history of the Quakers in Aberdeenshire by the discovery in 1826 at Ury of a MS. *Diary* of Jaffray, since published with elucidations (2nd ed., London, 1836).

Ireland.—The father of Quakerism in Ireland was William Edmondson; his preachings began in 1653–54. *The History of the Quakers in Ireland* (from 1653 to 1752), by Wright and Rutty, may be consulted.

America.—The earliest appearance of Quakers in America is a remarkable one. In July 1656 two women Quakers, Mary Fisher and Ann Austin, arrived at Boston. Under the general law against heresy their books were burnt by the hangman, they were searched for signs of witchcraft, they were imprisoned for five weeks and then sent away. During the same year eight others were sent back to England.

In 1657 and 1658 laws were passed to prevent the introduction of Quakers into Massachusetts, and it was enacted that on the first conviction one ear should be cut off, on the second the remaining ear, and that on the third conviction the tongue should be bored with a hot iron. Fines were laid upon all who entertained Quakers or were present at their meetings. Thereupon the Quakers, who were perhaps not without the obstinacy of which Marcus Antoninus complained in the early Christians, rushed to Massachusetts as if invited, and the result was that the general court of the colony banished them on pain of death, and four Quakers, three men and one woman, were hanged for refusing to depart from the jurisdiction or obstinately returning within it. That the Quakers were irritating cannot be denied: some of them appear to have publicly mocked the institutions and the rulers of the colony and to have interrupted public worship; and some of their men and women too acted with fanaticism and disorder. But even such conduct furnishes but a poor apology for inflicting stripes and death on men and women. The particulars of the proceedings of Governor Endicott and the magistrates of New England as given in Besse are startling to read. On the Restoration of Charles II. a memorial was presented to him by the Quakers in England stating the persecutions which their fellow-members had undergone in New England. Even the careless Charles was moved to issue an order to the colony which effectually stopped the hanging of Quakers for their religion, though it by no means put an end to the persecution of the body in New England.

It is not wonderful that the Quakers, persecuted and oppressed at home and in New England, should turn their eyes to the unoccupied parts of America, and nourish the hope of founding amidst their woods some refuge from oppression and some likeness of a city of God upon earth. In 1671–73 George Fox had visited the American plantations from Carolina to Rhode Island and had preached alike to Indians and to settlers; and in 1674 a moiety of New Jersey was sold by Lord Berkeley to John Fenwick in trust for Edward Byllinge. Both these men were

Quakers, and in 1678 Fenwick with a large company of his co-religionists crossed the Atlantic, sailed up the Delaware, and landed at a fertile spot which he called Salem. Byllinge, having become embarrassed in his circumstances, placed his interest in the State in the hands of Penn and others as trustees for his creditors, and they invited buyers, and companies of Quakers in Yorkshire and London were amongst the largest purchasers. In 1677–78 five vessels with eight hundred emigrants, chiefly Quakers, arrived in the colony (then separated from the rest of New Jersey under the name of West New Jersey), and the town of Burlington was established. In 1677 the fundamental laws of West New Jersey were published, and recognized in a most absolute form the principles of democratic equality and perfect freedom of conscience. Notwithstanding certain troubles from claims of the governor of New York and of the duke of York, the colony prospered, and in 1681 the first legislative assembly of the colony, consisting mainly of Quakers, was held. They agreed to raise an annual sum of £200 for the expenses of their commonwealth; they assigned their governor a salary of £20; they prohibited the sale of ardent spirits to the Indians, and forbade imprisonment for debt.

But beyond question the most interesting event in connexion with Quakerism in America is the foundation by William Penn (*q.v.*) of the colony of Pennsylvania, where he hoped to carry into effect the principles of his sect—to found and govern a colony without armies or military power, to reduce the Indians by justice and kindness to civilization and Christianity, to administer justice without oaths, and to extend an equal toleration to all persons professing theism. Such was “the holy experiment,” as Penn called it, which he tried, and which seemed as if it was destined to put Quakerism to practical proof. In 1681 he obtained a grant of the colony from Charles II., and in the following year settled the frame of government for the State and sailed for America. Here he entered into his celebrated treaty of unity with the Indians, “le seul traité entre ces peuples et les Chrétiens qui n’est point été juré et qui n’est point été rompu.” What was the result of this attempt to realize Quaker principles in a new country and on a virgin soil? The answer is in some respects indecisive. During the time that the Quaker influence was predominant, and for seventy years after the foundation of Pennsylvania, the Indians are said never to have taken the life of a white man; and once when five hundred Indians were assembled to concert a massacre they were turned from their purpose by six unarmed Friends. From England and Wales, from Scotland and Ireland, from the Low Countries and the banks of the Rhine, where Penn’s missionary visit had made a deep impression, emigrants crowded to Pennsylvania; in two years Philadelphia had risen to be a town of six hundred houses, and in three years from its foundation that city had increased more than New York in fifty years; and the first century of the life of the colony exhibited in an unusual degree a scene of happiness and peace. But, on the other hand, little progress was made in winning the Indians to Christianity, and the annals of the infant State were full of petty quarrels and jealousies. Penn was a feudal sovereign, having over him a Stuart king as his lord paramount at home, and the absolute democracy which he had established as his immediate dependents beneath him. In such relations there were necessarily elements of difficulty, and soon dissensions broke out between the governor and the colonists; a popular party was headed by members of the Quaker body and opposed the founder, and the influx of members of other religious persuasions led to dissensions in the assembly. The officials of the Court of Admiralty set up claims at variance with Penn’s notions; differences

broke out between the province properly so-called and the territories which afterwards became the State of Delaware. Penn was engaged in protracted quarrels as to the boundaries of his State; the English crown made requisitions on the colonists for men and money to support the war in America against France. Penn was during some years suspended by the crown from his rights as governor; his son and one of the deputy governors whom he sent out disgraced themselves by their licentious conduct; the colony gradually passed away from under the influence of Quakerism; and Penn's "Civitas Dei" faded into an American republic. For many years large numbers of Quakers emigrated from England to America. The most noteworthy incidents in their history are the part which they have taken in that movement which has ended in the abolition of slavery in the United States and the interest which they have exhibited in the native Indians.

France.—The origin of the few Quaker congregations which exist in France is curious. It seems that amongst the Camisards were found a few who disapproved of the military operations by which their friends resisted the persecution of Louis XIV., who believed in a spiritual light, who met for silent worship, and in other respects were like Quakers. Certain it is that towards the end of last century a small body of persons holding these views and these practices existed at Congenies and other villages at the foot of the Cevennes. During the war between England and France consequent on the American struggle for independence a Quaker was part owner in two luggers, which, against his protests, were employed as privateers and captured two valuable prizes; he took his share of the spoil, invested and accumulated it, and on the conclusion of peace in 1783 advertised in the *Gazette de France* for the owners of the captured ships. This advertisement came to the knowledge of the little body at Congenies, and hence a communication was established between the French and English Quakers. Probably about the same time certain American Quakers, on the invitation of the French Government, migrated from Nantucket to Dunkirk, for the purpose of extending the fisheries. A curious episode in Quaker history is the presentation, on 10th February 1791, to the National Assembly of a petition from these two bodies of French Quakers, and the reply of the president. The petition and answer were printed by Baudoin, printer to the Assembly.

Germany and Norway.—In both these countries exist small bodies of persons who have adopted the views and practices of the Quakers. These bodies date from early in the present century.

Statistics of Quakerism.—The number of Quakers in England and Wales in 1680 was probably about 40,000, and in 1806 about 32,000. In 1883 the total number of members in England, Wales, and Scotland was returned as 15,219 (193 were in Scotland), an increase of 106 on the previous year, and the number of habitual attenders of meetings of the body, not members, was 5380, an increase of 150. In Ireland there were, in 1883, 2812 Quakers. The Quakers in America number probably (including all bodies which claim to be Friends) from 90,000 to 100,000 and upwards. Besides these there are in Norway about 200, in France from 70 to 80, in Germany from 50 to 60, and in Australia and New Zealand from 500 to 600 Quakers.

Bibliography.—The writings of the early Quakers are numerous; the most noteworthy are the *Journal* of George Fox and the *Life* of Thomas Ellwood, both autobiographies, the *Apology* of Robert Barclay, and the works of Penn and Penington. The *History of the Quakers* by William Sewel, a Dutch Quaker, was translated into English, and has gone through several editions; a *History of the Quakers* by Gough may also be consulted. The *Sufferings of the Quakers*, by Besse (London, 1753), is the chief authority as to the persecutions they endured. The *Peculiarities of the Society of Friends*, and the other writings of Joseph John Gurney, exhibit the modern Evangelical Quakerism. The *Book of Discipline* of the Society, in its successive editions from 1782 to 1883, is the only authoritative statement of the views of the Society on Christian practice and church government, and a comparison of the different editions would throw light on the changes of sentiment in the body. The *Inner Life of the Religious Societies of the Commonwealth* (London, 1876), by Robert Barclay, a descendant of the apologist, contains much curious information about the Quakers. Smith's *Descriptive Catalogue of Friends' Books* (London, 1867) gives the information which its title promises. Bancroft's *History of the Colonization of the United States* may be consulted for the American history of Quakers. The periodicals now issued by members of the Quaker body in Great Britain are *The Friend*, *The British Friend*, *Friends' Quarterly Examiner*, and *Friends' Review*. (E. F.)

QUANTAMPOH, or **KUNTAMPOH**, a town of the Gold Coast region of western Africa, situated about 80 miles north-east of Coomassie, in 7° 36' N. lat. and 1° 4' W. long. According to Captain Brandon Kirby, who was the first white man to reach the place, it had in 1881 a resident population of 15,000, and traders passed through it to the number of about 25,000. Formerly it was one of the great ivory-marts of this part of Africa, and it is still a centre of the cola-nut trade, the slave trade, &c.

QUARANTINE (Fr. *quarantaine*, a period of forty days) is, in the original sense of the term, a thing of the past in the United Kingdom and in several of the other states of Europe, as well as in America. Its interest is therefore largely historical, and a sketch of the history will be given at the end of this article. But, in common usage, the same word is applied to the modern substitutes for quarantine, although these are a complete departure in principle or theory from the indiscriminate system of detention of ships and men, unloading of cargo in lazarets, fumigation of susceptible articles, and the like, which used to be carried to great lengths on account of the plague and in connexion with the Levantine trade.

Substitute for Quarantine in the United Kingdom.—The modern practice is to detain or refuse "pratique" to no ship unless there be a communicable form of sickness on board, or there had been such during the voyage. It is the duty of the officers of customs to question the captain as to the existence of any catching disease among the passengers or ship's company; if there be any evidence or suspicion of communicable infection, the officers of customs report the same to the port sanitary authorities, who have power to deal with the case under the Public Health Act, and according to an order of the Local Government Board first issued in 1873. The medical officer of health proceeds at once to make an inspection, detaining the ship and all on board only until such time as the inspection can be satisfactorily made, the sick removed to hospital, and disinfectants applied. This practice was adopted with success in the case of several arrivals from Baltic and North Sea ports with cholera on board in 1873, no extension of the disease on shore ensuing, and again in 1884 in the case of a troopship arrived at Portsmouth direct from Bombay, and of at least two arrivals (at Liverpool and Cardiff) from Marseilles, with cholera on board. It is also adopted from time to time on account of small-pox cases, and of other catching importations at the discretion of the port sanitary authority.

The last importation of yellow fever into the United Kingdom was at Swansea in September 1865, by a wooden vessel with copper ore from St Jago de Cuba. There had been cases of yellow fever on board during the voyage; but at Swansea (as in many other instances) the infection spread rather from the ship's hull and the unladed cargo than from the crew or their effects, and some fifteen deaths ensued. If such a case were to occur again, it would be dealt with, like any other communicable disease, by the port sanitary authority under the Public Health Act. The yellow-fever incident of 1865 at Swansea is the last occasion on which the sanction of the Quarantine Acts has been appealed to. The privy council merely directed the board of customs to warn the parties implicated of their liability to prosecution, although no prosecution would be instituted. The Quarantine Acts are still unrepealed, but they may be said to have become practically obsolete during the past twenty years.

Quarantine or its Substitutes in other European Countries.

—The principle of inspection, and of isolation of the sick, as stated above for the United Kingdom, was accepted with small reservation by the sanitary conference of Vienna in 1874, and it is now more or less consistently acted upon by all the larger European maritime states except Spain and Portugal. In times of cholera panic, quarantine of the original kind has been imposed against all arrivals from an "infected country" by ports of the Levant and Black Sea, and by several Mediterranean states besides Spain. But it is only in the ports of the Iberian Peninsula that the old quarantine traditions remain in force from year to year; and it is only for them that any special account need be given.

The principal occupation of the quarantine establish-

ment at Lisbon all the year round is with arrivals from Brazil, where yellow fever is endemic. The lazaretto of Lisbon, which is probably the largest and in ordinary times the busiest in the world, is situated on a hill opposite the Belem Tower, 4 miles below the city. The present establishment was erected by the Portuguese Government at a cost of over £200,000. It consists of seven perfectly distinct pavilions standing radially in a semicircle with the convexity to the river. It is managed by an inspector who is under the minister of the interior. Public tenders are invited every year, or every two years, for boarding and lodging the passengers according to their classes on board ship (1st, 2d, and 3d), the contract being given to the lowest bidder. The present prices for board and lodging *per diem* are about 5s. 6d. 1st class, 3s. 2nd class, and 1s. 6d. steerage. The establishment is carried on at a loss to the Government. Quarantine is imposed, as a matter of fact, on all ships, passengers, luggage, and cargo coming from the Brazils. The term varies from five days to seven days, according as the Brazilian port is considered infected or suspected. A bill of health is issued to the captain by the Portuguese consul at the port of sailing, which usually bears on it that so many deaths from yellow fever had occurred during the previous eight or ten days. If clean bills of health were issued, the quarantine would be raised; and this has happened for short periods at rare intervals. During the winter months (December, January, February), when the cold makes a development of the yellow fever virus at Lisbon improbable, if not impossible, the baggage and cargo only are subject to quarantine, the passengers being allowed to go ashore at once with their hand baggage. Throughout the rest of the year all passengers from the Brazils have to go to the lazaretto and stay there the allotted time, their effects being aired, fumigated, or disinfected. If Lisbon be the port of discharge, the cargo from an infected ship will be landed at the lazaret for purification if so directed. There is a schedule of "susceptible articles," which includes cotton, hair, hemp, letters, parcels, and other correspondence, hides, fresh meat, wool and linen, skin, feathers, and silk. These articles are fumigated with chlorine; the inside of the ship is washed with chloride of lime or other disinfectant. In the case of a mail steamer on her way to England, the passengers and effects for Lisbon are landed at the quarantine grounds, and the vessel proceeds to her destination (Liverpool or Southampton) "in quarantine," which means nothing as regards the English ports.

This rigorous routine is a concession to the popular recollection of the terrible epidemic of yellow fever in the hot summer of 1857, when there were 19,000 cases in and around Lisbon, with about 6000 deaths, a large proportion being among the well-to-do. The importation was traced to a tainted ship and cargo from Rio. For many years, no cases of yellow fever have developed among the suspected passengers landed; and in only two or three instances have there been cases among the employes of the establishment who are occupied with the baggage and merchandise. The Lisbon chamber of commerce is now in favour of a modification of the quarantine law, and of regulations in conformity with the prominent facts of experience—namely, that the fever is not started on shore through personal contact, but solely by emanations from a ship's hull, ballast, cargo, or passengers' effects, and that high-class iron steamships are not, in the nature of things, under the same suspicion as old wooden sailing vessels.

The quarantine practices of Lisbon are copied faithfully at the Azores, Madeira, and the Cape Verd Islands.

For Spain there are two chief quarantine stations or "foul lazarets," one for the Atlantic seaboard at Vigo, and another for the Mediterranean coast at Port Mahon,

Minorca. Vessels arriving at Spanish ports with foul bills of health (from Havana, &c., in ordinary times, and from various ports in cholera times) must proceed to one or other of these appointed stations to perform their quarantine. A "quarantine of observation," which is usually for six or three days, and is imposed on vessels with clean bills, may be performed at any port. It is a routine maxim of the Madrid board of health that any country, such as the United Kingdom, which does not practise quarantine, is *ipso facto* suspected when a foreign epidemic is in any part of Europe to which its vessels trade; and all arrivals from its ports may be subjected to a quarantine of observation. This abstract doctrine, which can hardly be approved by responsible medical authority, was acted on for a short time as recently as 1883 and 1884, when cholera was in Egypt and in Provence.

Next to Spain and Portugal, Turkey and Greece are the countries in Europe where the old quarantine traditions have most vitality, owing doubtless to their nearness to former seats of plague in the Levant. The lazarets at the Piræus and in the Dardanelles are considerable establishments, mostly used now in times of cholera. Ships bound inwards for Turkish ports take health-guards on board in the Dardanelles. There are many other lazarets at Mediterranean, Adriatic, and Levantine ports, including Malta and Gibraltar, surviving from the days of the plague, whose machinery is furbished up from time to time when cholera breaks out.¹ For the whole of northern Europe, including the Atlantic seaboard of France, quarantine is now practically obsolete; by Holland it was never seriously practised even for the plague, and by the states bordering on the Baltic it was given up about the same time as it fell into disuse in Great Britain.² In Norwegian ports subsequent to 1866 there were 3128 arrivals from countries infected with cholera, on board which 25 cases of cholera were found and 29 cases of cholera; but the malady obtained no footing on shore although quarantine was not enforced. In 1873, when cholera was prevalent in several ports of the Baltic and North Seas, there were 550 arrivals at Norwegian ports from infected countries, among which were 12 cases of cholera; but importation of the epidemic to the shore was prevented simply by inspection and isolation of the sick. In Italian ports, again, 800 vessels were quarantined in 1872, in not one of which was any case of cholera found. The immunity of the United Kingdom in 1873 and 1884, notwithstanding the arrival of ships with cholera on board, and even (in 1873) the unobserved landing of cholera cases, has been mentioned already.

Land Quarantine.—A land quarantine on a frontier is still enforced on account of cholera from time to time in southern Europe, *e.g.*, in 1884 by Italy against France at Ventimiglia and Modena and by Spain against France in the passes of the Pyrenees, and in 1885 by Portugal against Spain. The experiment occasionally succeeds. A "sanitary cordon" is the rigorous isolation (by troops) of a pestilence-stricken place from the country around. It is a survival from the times of the plague, and is of no use in cholera.

Quarantine or its Substitutes in the Western Hemisphere.—Apart from the visitations of cholera now and then, the

¹ Sir William Pym, the superintendent-general of quarantine, who visited most of them officially in 1844, narrates a case at Messina which illustrates the abuses that these establishments might be put to: "it is only very lately that the board of health at Messina placed a vessel (the 'Rapid') from England under quarantine, because a report had appeared in the papers of a fever having prevailed at Glasgow, and subjected her to a charge of about 8 per cent. upon the value of her cargo for quarantine fees" (*Correspondence respecting the Quarantine Laws*, Parl. Paper, 1846, p. 16).

² The lazaret for all the Baltic states was on the Swedish island of Kansa at the entrance of the Cattegat opposite Gothenburg.

chief occasion of quarantine on the American continent and adjacent islands is the endemic existence of yellow fever in Brazilian and West Indian harbours, particularly Havana and Rio de Janeiro (and, since 1853, in Callao and other Peruvian ports). During the yellow-fever season from April to November, the ports of the United States are on the outlook, under the quarantine laws of each State, to detain vessels with yellow fever on board arriving from Gulf ports or from the West Indies and Brazil. In like manner the ports of the River Plate would protect themselves against foul arrivals from Brazil; and some of the Mexican Gulf and West Indian harbours will even practise quarantine against each other according as the fever happens to be epidemic here or there. The practice at New York, Boston, Philadelphia, Baltimore, and other United States ports is to detain only the sick, or those who are reasonably suspected, the lazaret (usually on an island in the harbour) being practically a hospital for sailors, immigrants, and other newly-arrived persons suffering from communicable disease. In some years the cases of yellow fever arriving at New York have been numerous, and an epidemic has now and again arisen among the residents near the lazaret. Experience has shown that the ship's hull, foul ballast, and the like have been the real sources of infection, cases occurring at New York every year among the labourers on infected ships. It is only occasionally that the unloading of the cargo of a yellow-fever ship into the quarantine barges has been insisted on. The classification of ships according as they carry clean or foul bills of health has been found to be practically unworkable in the United States, a foul bill being a rare thing. The severity of the quarantine is left, accordingly, very much to the discretion of the medical officer of the port. According to the definition of the National Board of Health, quarantine is "the administration employed to determine the presence or absence of the causes of contagious or infectious diseases, and to secure the removal or destruction of such causes;" and it does not imply detention for any specified time, nor for more time than is necessary for the above purposes. Notwithstanding the creation of a National Board of Health for the Federal Union, quarantine is still an affair of the States acting independently. The detection and isolation of small-pox cases is one of the chief occupations of the quarantine officers at United States ports.

As regards the introduction of cholera into the United States, Billings says:—"The present quarantine systems of the United States are now probably unable to prevent the introduction of this disease, as they have been heretofore. Unless the disease had actually occurred on board ship, very little precaution would be taken, and very few of our ports have the necessary facilities for properly dealing with a large passenger ship having cholera on board, in such a manner as to obtain a reasonable amount of security without causing unreasonable delay, involving unnecessary suffering and danger on the part of those not actually sick" (*Trans. Internat. Med. Congress*, London, 1881, iv. 416).

In several instances, when cholera has broken out among emigrants in a transatlantic steamship, the vessel has put into Halifax, N. S., where there are facilities for quarantining passengers; and more than once the epidemic, although of the most threatening kind, has gone no farther. New Orleans has proved itself a more likely port of entry for cholera than any of the Atlantic ports.

In the ports of South America and the West Indies the quarantine practice is variable and empirical. Sometimes an absolute cordon has been established, as in the instance of Dominica against Guadeloupe in 1865-66 during the cholera. The smaller and healthier the community the more severe is the quarantine likely to be. In the West Indies, the Bermudas, &c., the very remarkable disease of

dengue (probably a modern hybrid form) is considered to be an importable infection which quarantine can keep out.

Quarantine in the Red Sea and at Suez.—Cholera having come to Europe in 1865 by a new route, by the pilgrim traffic to Mecca, the conference of Constantinople in 1866 took into consideration the question of a quarantine at the Straits of Bab-el-Mandeb. Since that time such a quarantine has been instituted for pilgrim ships at the island of Xamaran on the Arabian side of the Red Sea, some 200 miles within the straits. Since the severe outbreak of cholera at Mecca in the end of 1881, the quarantine for pilgrim ships at Xamaran has become more stringent. The slight outbreak at Mecca in 1882 is said, without good reason, to have arisen owing to three English steamships with pilgrims having evaded that quarantine. All pilgrim ships whatsoever are required to stop at Xamaran,¹ and the pilgrims from cholera-stricken countries in the East are disembarked and kept under observation in the lazarets on the island for ten or fifteen days.²

On the dispersal of the hajj at Mecca, another quarantine is performed by the pilgrims returning by way of Suez, who are usually only a small fraction of the whole assemblage. They are disembarked either at Wejh on the Arabian coast half way between Jeddah and Suez, or at Tor on the Sinaitic side of the Gulf of Suez, sometimes even at both places. After the epidemic at Mecca from September to December 1881, it was not until the 19th February 1882 that the last company of pilgrims was allowed to re-embark at Wejh for Suez, by the authority of an inspecting sanitary commission from Egypt. If no suspicious cases occur, the detention is for fourteen days; but a single case subjects the whole group in which it had appeared to a further term of quarantine. Pilgrims bound for Smyrna, Beyrout, or other ports in the Levant are subjected to another term of quarantine in the lazaret of the port of arrival. Those proceeding landwards to Damascus undergo a quarantine at Moses' Wells.

The usefulness of this control over the movements of the Mecca pilgrims has been much debated. Regarding the advantages of the quarantine after the breaking up of the hajj there has been a good deal of positive evidence since 1865; but the detention at Xamaran is a much more questionable affair. In a great assemblage at Mecca, such as that of 1881, there are all the conditions for the fresh breeding of a choleraic form of sickness, which shall be communicable to others, just as there have often been (in the common-

¹ The working of the quarantine at Xamaran will be best understood from a particular instance. The steamship "Hesperia" sailed in July 1882 from Bombay for Jeddah with 498 pilgrims, who had been inspected under the Native Passengers Act. She arrived on the 26th July at Aden, where she was quarantined for ten days owing to the death of one of the firemen from cholera. Xamaran was reached on the 8th of August, and the pilgrims landed for a ten days' quarantine. Deaths having occurred among the pilgrims on shore, a second quarantine of ten days was imposed; and towards the expiry of that time the health officer again placed the ship in quarantine for ten days owing to more deaths on shore. On September 8, when the vessel was still in quarantine, it became necessary to proceed to Aden for coals, steam having been kept up continually owing to the dangerous nature of the quarantine moorings. In leaving Xamaran the ship broke her quarantine, and only escaped the threatened fire of the Turkish gunboat by her speed. She returned from Aden on the 19th September, and re-embarked her passengers for Jeddah on the 23d, two of them dying in the boats during the embarkation. The drinking-water of the quarantine camp at Xamaran was credibly stated to be in a fetid condition, causing vomiting and purging, and the food insufficient and inferior. Each pilgrim had to pay 10 rupees, and the ship 12,000 piastres of sanitary dues. After landing her passengers at Jeddah, the "Hesperia" proceeded on her voyage to Liverpool, undergoing a twenty-four hours' quarantine of observation at Suez.—*Brit. Med. Journ.*, 1882, ii. 952.

² The international sanitary conference of Rome (1885) has proposed a relaxation of the rule: each ship with more than thirty pilgrims to carry a doctor, and no ship to be detained more than 24 hours, nor the pilgrims disembarked, unless there be or has been cholera on board.

sense view) the elements of its *de novo* origin under precisely similar circumstances among a multitude of Hindus at Hurdwar, or other religious places of resort in India; and the excessive pains taken to exclude hypothetical cases of the communicable disease coming from India, Java, or other endemic centre are disproportionate so long as there is no assurance that the soil of Mecca is not itself about to become a breeding-place of the poison *de novo*. On the other hand the dispersal from Mecca is obviously an occasion for sanitary precautions.

For the general traffic from the East a quarantine of observation of twenty-four hours is imposed on arrivals at Suez from time to time when cholera is formally declared to be epidemic in Bombay or other Eastern port. Under such circumstances, ships pass through the canal in quarantine, having their canal pilots either on board the ship "in quarantine," or, under an older and more cumbersome arrangement, navigating the vessel from a steam-launch. In like manner, the coaling at Port Said is done in quarantine, and the mails and passengers landed at Brindisi under the same restrictions and formalities. The question of a more searching quarantine at Suez for the general Eastern traffic has been much discussed in the French Academy of Medicine, and has been taken up more recently at Berlin; but the weight of opinion (led by M. de Lesseps) is against any such interference with the quick despatch of vessels, as at once futile and impracticable.¹ During all the years that the canal has been open, cholera has become epidemic in Europe only once owing to direct importation from the East, namely in 1884, when the vehicle was a transport returned from Saigon; and the circumstances in that case were such that a quarantine at Suez, unless it had included the ship's hull and the personal effects on board, would have made no real difference. On the other hand, transports with recognized cholera on board have on two or three previous occasions been passed through the canal with all despatch, and no harm done on shore either in the isthmus of Suez or at the port of arrival (Portsmouth, Toulon).

PRINCIPLES OF QUARANTINE.—Plague, yellow fever, and Asiatic cholera are the three great spreading diseases which have been successively the subject of quarantine restrictions.

Plague. For many years *plague* has ceased to have any practical interest in this connexion; the last occasion of alarm in the Mediterranean ports was the outbreak of 1859, at Benghazi, in Tripoli; and at the present date the sole concern is about the land quarantine along the Turko-Persian and Russo-Persian frontiers. It is for yellow fever and Asiatic cholera, therefore, that the principles of quarantine have chiefly to be discussed, the epidemiological principles being somewhat different in the two cases. But one or two remarks have to be made about the theory of preventing the introduction of other communicable diseases.

Small-pox. In the draft of an international bill of health which was adopted by the international sanitary congress at Washington in 1881 small-pox and typhus are scheduled along with plague, yellow fever, and cholera. Although there are few countries where *small-pox* has not obtained a footing, yet every seaport finds it advisable to prevent the free entrance of fresh cases. Thus Denmark, in 1884, took precautions against the importation of small-pox from the Thames. It is mostly in Australia, New Zealand, the Cape, and other colonies that quarantine against small-pox is rigorously carried out. Except for a limited outbreak in Sydney in 1884, that disease has been absolutely excluded from the Australasian colonies, thanks to their admirable quarantine establishments. The case is very different at the Cape, owing to the existence of a virulent native centre of variculous disease at no great distance in the interior.

Typhus. As regards *typhus*, the principles of prevention are entirely different from those that apply to small-pox. When the Irish emigration by sailing ships was brisk forty years ago, typhus often came with the new arrivals to New York, Boston, Philadelphia, Quebec, and Montreal; and a similar state of things now goes on in

connexion with the Italian and other European emigration to Brazil and the River Plate. Filth, overcrowding, and want are the causes of such outbreaks; and it is only where those conditions obtain on shore that the imported disease spreads. A period of detention amidst clean and wholesome surroundings after landing has much to recommend it, the best argument for such general precaution being the fact that the disease in some instances had not occurred during the voyage, but only after the emigrants had landed in the new country. Another illustration of the need of quite special rules for typhus, and of the need of freedom from dogmatic bias about pre-existing disease germs, is the remarkable outbreak at Liverpool in 1859. The epidemic was clearly traced to an Egyptian frigate with four hundred souls on board, many of them convicts in chains. The vessel arrived in the Mersey from Alexandria in an indescribable state of filth; about one hundred of the crew and others were on the sick list from diarrhoea, dysentery, and the like; but none of the cases were typhus, nor was there a single case of that disease among the ship's company from first to last. The typhus occurred in the pilot and others who went on board in the river, among the attendants at a bath to which the filthy crew were sent to be washed, and among the patients of the Southern Hospital, into which some of the Arabs and Nubians were admitted for common complaints. To make quarantine effective against typhus, it is necessary to keep in mind that the specific fever may be vicarious to a common condition of filth and general misery. It is a modified form of the same principle of vicarious infection that, in the historical retrospect, gives us the key to the much more important problem of yellow fever, a disease which is to be regarded as a special form of typhus.

Principles of Quarantine against Yellow Fever.—The first Yellow requirement in the quarantine doctrine of yellow fever is to know where the disease is endemic, that is to say, where its poison exists in such a form that it may rise in exhalations from the harbour mud, alluvial foreshores, or wharves and shipping quarters in general, or may enter the bilges of ships with the water. There is a natural reluctance on the part of seafaring communities in the western hemisphere to admit that they harbour the seeds of yellow fever; but some of the endemic foci of the disease are beyond dispute. The principal are Havana and Rio de Janeiro. But if we take the whole historical period of yellow fever into our view, from 1640 onwards, we shall find that there is hardly a single great slave port in the New World that has not been at one time or another a native seat and source of the miasmatic virus of yellow fever. Some of these have long since got rid of the poisonous exhalations, such as Philadelphia and Baltimore; others, such as Norfolk, Charleston, and Savannah, have in all probability seen the worst days of the fever, and are now practically free from the taint in their harbours and their soil; but there are other United States ports, such as New Orleans, for which the like assurance cannot as yet be given. In the West Indies the ports of the Spanish Antilles are the worst primary breeding-places of the poison at the present day; although in the 17th and 18th centuries Bridgetown (Barbados), English Harbour (Antigua), Fort Royal (Martinique), and Basse Terre (Guadeloupe) were poisonous to the crews of the stationary men-of-war to an almost incredible extent. On the mainland, Georgetown, Demerara, is in the same rank; and the Brazilian ports (particularly Rio) have been so since 1849. Besides these harbours, all of them among the principal slave-ports at one time or another, there are others, such as Vera Cruz, Tampico, Chagres, and Porto Bello, which would seem to have lurking in their soil or shore-mud the specifically noxious thing that produces yellow fever; but it is a question whether these have not got the virus at second-hand from other centres in the Gulf. Again, it is probable that the occasional outbreaks at Monte Video had been caused by material quantities of the specifically noxious filth carried thither in trading bottoms. The great epidemics in the ports of Spain in the first quarter of this century were certainly due either to reshipment of the virus from the West Indies in the bilges of merchantmen, or to an original deposition of it from contraband slave-ships making the return voyage to Europe with cargoes of produce (see an article by the writer in the *North American Review*, Oct. 1884). The rare outbreaks in Europe within the last fifty years have been due to foul arrivals from slave-ports like Havana and Rio.

Wherever the line be drawn between endemic and non-endemic ports of yellow fever, it is only the latter that can in reason seek to impose quarantine against the disease. Of such are now the ports on the Atlantic seaboard of the United States, the ports of the River Plate, and the whole European seaboard; for these the history is full of instances of true importations traceable to particular vessels, and from such instances the principles of an efficacious quarantine may be deduced. It is not a passenger steamship arriving at New York or Lisbon with a case or cases of yellow fever on board that calls for quarantine (as distinguished from isolation and care of the sick); no real epidemic can be shown to have ever arisen from purely personal importation of that kind. The great epidemics in Spain and Portugal, and the more recent and smaller outbreaks in New York and in some ports of northern

¹ A large majority of the medical delegates to the conference of Rome (1885) voted in favour of detaining at Suez for at least five days such vessels as might be judged by an officer of the International Sanitary Commission to be suspect,—the passengers to be disembarked and isolated in groups.

Europe, have been traced to other sources than the persons of the sick. Even a ship with a fever-stricken crew is dangerous, not so much because of the fever among the crew, but on account of those lurking causes of yellow fever in the ship through which the crew themselves were infected. There is an overwhelming mass of testimony that the real risk of importing the yellow-fever virus is always in the foul bilges of wooden ships, which had been lying in one of the endemic yellow-fever harbours. The poison is sucked in through the ship's seams; it ferments or multiplies in her bilges, rises as miasmata to infect the hold or 'tween decks, sometimes clinging to cargo, and perhaps making no sign until the cargo is all out. Again, in temperate latitudes, the virus may be imported and do no harm, unless it meet with a tract of exceptionally hot weather, such as happened at Swansea in 1865. According to this principle, all iron ships, which have little or no bilge-water, and all clean ships whatsoever, are practically free from the risk of importing an epidemic of yellow fever, even although one or more of their passengers or crew may have developed the malady on the voyage, having come on board in the stage of its incubation. The only question of practical consequence in the case of iron steamships arises in connexion with the modern practice of carrying water-ballast in tanks or compartments of the ship's bottom. On the other hand a wooden ship from a yellow-fever port, especially if she have open seams and had lain long in the harbour or "carenage," is not above suspicion on arriving during hot weather, even if no cases of yellow fever had occurred on board during the voyage. Such vessels have often carried the yellow-fever poison in their bilges; in some cases they had not been suspected until it was too late, and in other cases of mysterious outbreaks they have never been suspected at all because they had no actual cases on board. The grand lesson of experience in yellow fever is that the ship's hull is infinitely more dangerous than the persons of yellow-fever patients; and a ship's hull is dangerous only because there is a material quantity of specifically poisonous filth fermenting in the recesses of the hold. All high-class iron ships, and clean ships in general, are, for common-sense purposes, above suspicion. The persons of the sick are little likely to introduce the fever; but foul linen, bedding, and clothes are a source of danger, especially if they have been in a box or bundle for some time (witness the slight outbreak at Madrid in 1878 on the unpacking of soldiers' baggage brought *via* Santander from Cuba).

Cholera.

Principles of Quarantine against Cholera.—The peculiar dangers of cholera diffusion arise from the vomited and purged matters which are characteristic of the common type of the malady. Under certain circumstances the discharges of the sick are infective; they are probably not infective as they come from the body; but even minute quantities of the choleraic matters, if they have fermented in the ground, or in boxes and bundles of foul linen, bedding, or clothes, may exhale a virus which is often suddenly prostrating in its action. Thus every person with cholera, or even with choleraic diarrhoea in times of epidemic, is a source whence many more may be poisoned. When the choleraic matters percolate into wells or reservoirs the poisoning may be on a great scale. Cholera with such infective properties is an exotic to the soil of Europe and probably of all countries except south-eastern Asia; and, if the infective discharges of cholera patients from the East were kept out of Western soil, no choleraic disease would be likely to become epidemic on the latter. Such exclusion has been more or less the endeavour of all Western states from the time of the first invasion through Central Asia in 1831. The only question is whether, by attempting too much, they have not lost the opportunity of controlling the spread of the disease by less drastic means. The instances where cholera has been kept out by a rigid cordon, or the strictest form of quarantine, are few: it is probable that Spain owed her immunity in 1849, when all the rest of Europe suffered, to her policy of exclusion; there was a strikingly successful instance of the same in the case of Dominica in 1865, during a frightful cholera mortality in Guadeloupe, only 22 miles distant; and it has happened more than once for Portugal to keep out the epidemic and for Sicily to protect herself for a time against the mainland of Italy. But in the great majority of instances the quarantines against cholera have been "elaborate illustrations of leakiness." Island communities have the best chances of succeeding; but in the case of the British Islands the attempt has been abandoned as impracticable. The British policy of attempting a good deal less was justified by success in 1873, when the Baltic and North Sea trade went on uninterruptedly, notwithstanding the presence of cholera at various ports across the water. In 1874 the international sanitary conference of Vienna adopted an abstract resolution by a large majority approximately in favour of the British practice, though the conference of Rome in 1885 was slightly reactionary. According to this practice a case of cholera is received into the country with much the same sort of assurance as a case of typhoid fever would be. There is much reason to believe that in both cases the agency of the soil or other *tertium quid* is needed to give potency to the poison, and that the diffusion of both diseases can be limited by disposing of the discharges of the sick in

such a way that they shall neither taint the soil or the water, nor ferment on unwashed linen or bedding. Wherever a filth-sodden soil receives the choleraic matters, poisonous miasmata will rise from it; and such miasmata will also arise even in houses or on board ship, or from bundles and boxes of effects, if cleanliness be thoroughly overpowered by the stress of events. In India such cholera-soils exist from year to year, or are capable of being made on occasion, as at great religious fairs; and in that respect some Indian soils are to cholera what certain of the harbours and foreshores of the western hemisphere are to yellow fever. Both diseases in their native seats are primarily caused by specific miasmata from the tainted soil. But in Europe the spreading power of cholera is infinitely greater than that of yellow fever because the choleraic matters are more copious, and more likely to ferment under all circumstances of climate, locality (coast and interior), states of weather, and differences of race. But there is still a reasonable prospect of finding a good substitute for quarantine against cholera in the fact that its power of spreading is certainly made subject to conditions. The maxim for cholera is—Take care of the conditions, and the disease will take care of itself. Cholera is what Pettenkofer calls an "exogenous" infection: the infective matter acquires its virulence, not in or upon the body, as in a case of small-pox, but outside the body, amidst filth or other sanitary neglect. The reason why cholera is more difficult to manage than typhoid fever is that it is peculiarly a disease of the poor; "poverty has always been the true quartermaster of cholera." The virus is transported (in the West at least) from place to place largely by emigrants, religious pilgrims (as in Russia), fugitives, tramps, or others hard pressed by circumstances; one of the most remarkable instances of that kind is its alleged transmission, in 1833, from Kansas across the Rocky Mountains to the Pacific by parties of Indians successively infected. The danger from the wandering poor is all the greater that they would be naturally unwilling under any circumstances to sacrifice their small belongings of clothes, bedding, and the like, which are often the real media of infection. It is not to be denied that the old-fashioned detention for a week or more in a lazaret has still something to recommend it for such poor classes of travellers; but the detention will be more likely to give vitality to any lurking virus of the disease than to extinguish it, unless the lazaret be particularly well found in all the conveniences of living.

HISTORY OF QUARANTINE.—The first lazarets in Europe were constructed for the plague; and that disease was the only one for which quarantine was practised (not to mention the earlier isolation of lepers, and the attempts to check the invasion of syphilis in northern Europe about 1490) down to the advent of yellow fever in Spain at the beginning of the 19th century, and the arrival of Asiatic cholera in 1831. Venice took the lead in measures to check the spread of plague, having appointed three guardians of the public health in the first years of the Black Death (1348). The next record of preventive measures comes from Reggio in Modena in 1374. The first lazaret was founded by Venice in 1403, on a small island adjoining the city; in 1467 Genoa followed the example of Venice; and in 1476 the old leper hospital of Marseilles was converted into a plague hospital, the great lazaret of that city, perhaps the most complete of its kind, having been founded in 1526 on the island of Pomègue.

The practice at all the Mediterranean lazarets was not different from the English procedure in the Levantine and North-African trade, to which the rest of this sketch will be confined. On the approach of cholera in 1831 some new lazarets were set up at Western ports, notably a very extensive establishment near Bordeaux, afterwards turned to another use.

The plague had disappeared from England, never to return, for more than thirty years before the practice of quarantine against it was definitely established by an Act of Parliament of Queen Anne's reign (1710). The first Act was called for, owing to an alarm lest plague should be imported from Poland and the Baltic; the second Act of 1721 was due to the disastrous prevalence of plague at Marseilles and other places in Provence; it was renewed in 1733 owing to a fresh outbreak of the malady on the Continent, and again in 1743 owing to the disastrous epidemic at Messina. In 1752 a rigorous quarantine clause was introduced into an Act regulating the Levantine trade; and various arbitrary orders were issued during the next twenty years to meet the supposed danger of infection from the Baltic. Although no plague cases ever came to England all those years, the restrictions on traffic became more and more stringent (following the movements of medical dogma), and in 1788 a very oppressive Quarantine Act was passed, with provisions affecting cargoes in particular. The first year of this century marks the turning point in quarantine legislation; a parliamentary committee sat on the practice, and a more reasonable Act arose on their report. In 1805 there was another new Act, and in 1823-24 again an elaborate inquiry followed by an Act making the quarantine only at discretion of the privy council, and at the same time recognizing yellow fever "or other highly infectious disorder" as calling for quarantine measures along with plague. The steady approach of cholera in 1831 was the last occasion in

England of a thorough-going resort to quarantine restrictions. The pestilence invaded every country of Europe despite all efforts to keep it out. In England the experiment of hermetically sealing the ports was not seriously tried when cholera returned in 1849, 1853, and 1865-66. In 1847 the Privy Council ordered all arrivals with clean bills from the Black Sea and the Levant to be admitted to free pratique, provided there had been no case of plague during the voyage; and therewith the last remnant of the once formidable quarantine practice against plague may be said to have disappeared. The quarantine establishment fell gradually into disuse, and is now represented by a hulk at the Motherbank (Portsmouth), which is kept up solely for formal reasons.

For a number of years after the passing of the first Quarantine Act (1710) the protective practices were of the most haphazard and arbitrary kind. In 1721 two vessels laden with cotton goods, &c., from Cyprus, then a seat of plague, were ordered to be burned with their cargoes, the owners receiving £23,935 as indemnity. By the clause in the Levant Trade Act of 1752 vessels for the United Kingdom with a foul bill (*i.e.*, coming from a country where plague existed) had to repair to the lazaretto of Malta, Venice, Messina, Leghorn, Genoa, or Marseilles, to perform their quarantine or to have their cargoes "sufficiently opened and aired." Since 1741 Stangate Creek (on the Medway) had been made the quarantine station at home; but it would appear from the above clause that it was available only for vessels with clean bills. In 1755 lazarets in the form of floating hulks were established in England for the first time, the cleansing of cargo (particularly by exposure to dews) having been done previously on the ship's deck. There was no medical inspection employed, but the whole routine left to the officers of customs and quarantine. In 1780, when plague was in Poland, even vessels with grain from the Baltic had to lie forty days in quarantine, and unpack and air the sacks; but owing to remonstrances, which came chiefly from Edinburgh and Leith, grain was from that date declared to be a "non-susceptible article." About 1788 an order of council required every ship liable to quarantine, in case of meeting any vessel at sea, or within four leagues of the coast of Great Britain or Ireland, to hoist a yellow flag in the day time and show a light at the maintopmast head at night, under a penalty of £200. After 1800 ships from plague-countries (or with foul bills) were enabled to perform their quarantine on arrival in the Medway instead of taking a Mediterranean port on the way for that purpose; and about the same time an extensive lazaret was built on Chetney Hill near Chatham at an expense of £170,000, which was almost at once condemned owing to its marshy foundations, and the materials sold for £15,000. The use of floating hulks as lazarets continued as before. In 1800 two ships with hides from Mogador (Morocco) were ordered to be sunk with their cargoes at the Nore, the owners receiving £15,000. About this period it was merchandise that was chiefly suspected: there was a long schedule of "susceptible articles," and these were first exposed on the ship's deck for twenty-one days or less (six days for each instalment of the cargo), and then transported to the lazaret, where they were opened and aired forty days more. The whole detention of the vessel was from sixty to sixty-five days, including the time for reshipment of her cargo. Pilots had to pass fifteen days on board a "convalescent ship." The expenses may be estimated from one or two examples. In 1820 the "Asia," 763 tons, arrived in the Medway with a foul bill from Alexandria, laden with linseed; her freight was £1475 and her quarantine dues £610. The same year the "Pilato," 495 tons, making the same voyage, paid £200 quarantine dues on a freight of £1060. In 1823 the "William Parker" from Alexandria paid £188, or 5½ per cent. on the value of her cargo. In 1823 the expenses of the quarantine service (at various ports) were £26,090, and the dues paid by shipping (nearly all with clean bills) £22,000; in 1824 the figures were respectively £23,704 and £14,419. A parliamentary return moved for by Mr Forster showed the expenses of the quarantine establishments at Rochester, Portsmouth, Bristol, Milford, Liverpool, and Bo'ness for the year ending 6th January 1846 to be £15,590. A return for the United Kingdom and colonies moved for by Mr Joseph Hume in 1849 showed, among other details, that the expenses of the lazaret at Malta for ten years from 1839 to 1848 had been £53,553. Under the direction of Sir W. Pym, the superintendent-general of quarantine, the home establishments were gradually reduced from 1846 onwards; and the reports of the Board of Health (signed by Chadwick, Southwood Smith, and others) in 1849 and 1852, which argued against quarantine, although not always on sound epidemiological principles, gave a further impetus in the same direction. The most recent appeal to the quarantine law (at Swansea in 1865) has been referred to above.

Literature.—The most considerable treatise on quarantine is the article (pp. 166) by Léon Colin in the *Dict. Encycl. des Sc. Méd.*, 3d section, vol. I, Paris, 1874 (with a bibliography). There is also a general article by Reimke in Eulenburg's *Handbuch des Gesundheitswesens*. A quarantine committee of the Social Science Association collected, in 1880-81, valuable consular returns on the practice of quarantine in all parts of the world; these were edited by Milroy and ordered to be printed (with the report and summary) as three parliamentary papers communicated to the board of trade. The third paper (6th August 1881, No. 544)

contains, in an appendix, an *Historical Sketch of Quarantine Legislation and Practice in Great Britain*, by Dr Milroy, from which the above historical notes have been largely taken. See also Sherston Baker, *Law of Quarantine*, Lond., 1873. Russell's *Treatise of the Plague* (4to, London, 1791) contains "remarks on quarantines, lazarettoes, &c.," and an account of the mode of "shutting up" practised by households in Aleppo on the outbreak of plague in the town. On plague-quarantines, see also Hirsch, in the *Vierteljahrsschrift für Offentl. Gesundheitspflege*, 1880, xii. 6. The inexpediency of quarantine in the United Kingdom is discussed by John Simon in the eighth *Report of the Medical Officer of the Privy Council* for 1865, p. 35. The fifth *Report* (new series), 1875, contains an abstract by Seaton of *Proceedings of the International Sanitary Conference at Vienna, 1874*. (C. C.)

QUARANTINE, CATTLE. The importation of foreign cattle into England was forbidden at a comparatively early period. Thus 18 Car. II. c. 2 made such importation a common nuisance. In 1869 previous legislation was consolidated by the Contagious Diseases (Animals) Act, 1869, which applied to the United Kingdom. In 1878 this Act was repealed and new provisions made by the Contagious Diseases (Animals) Act, 1878, amended by two Acts passed in 1884. By this Act the privy council is empowered to make from time to time such general or special orders as they think fit for prohibiting the landing of animals brought from a foreign country. Foreign animals can be landed only at certain ports named by the privy council, and must be slaughtered on landing, unless they are intended for exhibition or other exceptional purposes, in which case they are subject to the quarantine rules given in the fifth schedule of the Act. In the United States the importation of neat cattle is forbidden by the Act of 1883, c. 121, except as allowed by the secretary of the treasury. The appropriation Acts since 1881 have made annual grants of sums of \$50,000 to enable the secretary of the treasury to cooperate with State and municipal authorities in making regulations for the establishment of cattle quarantine stations. The cattle quarantine system of Canada is said to be one of the most perfect existing. In 1876 a quarantine of eight days was established, raised to ninety days in 1879. The chief Canadian Act is 42 Vict. c. 23. The effect of the Canadian precautions has been that English orders in council have allowed Canadian cattle to be imported into the United Kingdom for breeding and exhibition purposes.

QUARANTINE, WIDOW'S, is the right of a widow to remain in the principal house belonging to her husband for forty days after his death. It is specially recognized in Magna Carta and in some of the State laws in the United States.

QUARE IMPEDIT, in English law, is a form of action by which the right of presentation to a benefice is tried. It is so called from the words of the writ formerly in use which directed the sheriff to command the person disturbing the possession to permit the plaintiff to present a fit person, or to show cause "why he hinders" the plaintiff in his right. The action is one of the few surviving real actions preserved by 3 & 4 Will. IV. c. 27. As a real action it could before the Judicature Acts have been brought only in the Court of Common Pleas. The effect of recent legislation has been to assimilate proceedings in *quare impedit* as far as possible to those in an ordinary action. It is now usually brought against a bishop to try the legality of his refusal to institute a particular clerk. The bishop must fully state upon the pleadings the grounds on which he refuses. *Quare impedit* is peculiarly the remedy of the patron; the remedy of the clerk is the proceeding called *duplex querela* in the ecclesiastical court. At common law no damages or costs were recoverable in *quare impedit*; 13 Edw. I. st. 1, c. 5, provided for damages up to two years' value of the benefice, and 4 & 5 Will. IV. c. 39 for costs. The action is not barred till the expiration of sixty years, or of three successive incumbencies adverse to the plaintiff's right, whichever period be the longer (3 & 4 Will. IV. c. 27, § 29). Where the patron of a benefice is a Roman Catholic, one of the universities

presents in his place (1 Will. and Mary, sess. 1, c. 26). By 13 Anne c. 13 during the pendency of a *quare impedit* to which either of the universities is a party in right of the patron being a Roman Catholic the court has power to administer an oath for the discovery of any secret trust, and to order the *cestui que trust* to repeat and subscribe a declaration against transubstantiation.

QUARLES, FRANÇOIS (1592–1644), a sacred poet of the 17th century, enjoyed considerable celebrity in his own day, and some of his works have shared in the recent revival of interest in our older literature. The work by which he is best known, his *Emblemes*, was originally published in 1635, with grotesque illustrations, engraved by Marshall, and borrowed from the *Pia Desideria* of Hermann Hugo. The poems, which are diffuse meditations upon Scriptural texts, seem, in modern phrase, to have been “written up” to the illustrations, and are quite in keeping with their quaint mixture of sublime and familiar thoughts. An edition of the *Emblems*, with new illustrations by C. H. Bennett, was published in Edinburgh in 1857, and these illustrations are reproduced in Mr Grosart’s complete edition in the Chertsey Worthies Library. The incongruous oddities of Quarles’s verse are more obvious than the higher qualities that recent admirers claim for him. The following stanza, in a paraphrase of Job xiv. 13, has often been referred to as the supreme example of his occasional sublimity of thought:—

“’Tis vain to flee; till gentle Mercy show
Her better eye, the farther off we go
The swing of Justice deals the mightier blow.”

Quarles would seem to have been a man of good family, and he boasts of his “long-lived genealogy.” He was born at Romford in Essex in 1592, and, after a regular education at school, Christ’s College, Cambridge, and Lincoln’s Inn, had influence enough at court to get the office of cup-bearer to the queen of Bohemia. He was afterwards (about 1621) appointed secretary to Ussher, the primate of Ireland, and later on, returning at an uncertain date to England, obtained (in 1639) the post of city chronologer, which had been held before him by Middleton and Ben Jonson. Upon the outbreak of the Civil War he wrote on the Royalist side, and died in 1644, in consequence, his widow suggests, of his harsh treatment by the king’s enemies. Quarles’s first publication, with the suggestive title of *The Feast of Wormes*, appeared in 1620, and from that date till his death he was a busy and prolific writer of verse and prose. His *Divine Poems*, collected in 1630, were published separately at intervals in the course of the preceding ten years. *Divine Fancies* followed in 1632; then the *Emblems*, which might well come under that general designation. The earlier poem of *Argalus and Parthenia* (1622) was in a different vein: the substance was imitated from Sidney’s *Arcadia*, and the verse from Marlowe’s *Hero and Leander*. The speeches are spun out to a most tedious length, but the poem contains more fine lines and fewer incongruous fancies than any other of the author’s productions. Quarles also published many *Elegies*, in the fashion of memorial verses of which Milton’s *Lycidas* was the contemporary masterpiece. His *Hieroglyphics*, in the same vein as his *Emblems*, appeared first in 1638. His principal prose work was the *Enchyridion* (1640), a collection of four “centuries” of miscellaneous aphorisms. This was followed two years later by more “observations” of the same kind “concerning princes and states.” Lovers of commonplace wisdom dressed in a garb always studiously quaint and sometimes happily epigrammatic, may turn to Quarles with every prospect of enjoyment.

QUARTER SESSIONS (in full, GENERAL QUARTER SESSIONS OF THE PEACE) is the name given to a local court with civil and criminal jurisdiction. In England the

court consists in counties of two or more justices of the peace, one of whom must be of the quorum (see JUSTICE OF THE PEACE), in cities and boroughs of the recorder alone. The quarter sessions are a court of record. The records in a county are nominally in the custody of the *custos rotulorum*, the highest civil officer in the county, practically in that of the clerk of the peace, who is nominated by the *custos* and removable by the quarter sessions. In a city or borough he is appointed by the council and removable by the recorder. The original jurisdiction of quarter sessions seems to have been confined to cognizance of breaches of the peace. By a series of statutes passed in the reign of Edward III. the time of the holding of the sessions was fixed, and their jurisdiction extended to the trial of felonies and trespasses. The jurisdiction now depends upon a mass of legislation reaching from 1344 to the present time. The dates at which the county sessions must meet are fixed, by 2 Geo. IV. and 1 Will. IV. c. 70, to be the first weeks after the 11th of October, the 28th of December, the 31st of March, and the 24th of June. Quarter sessions in a city or borough depend upon the Municipal Corporations Act, 1882, 45 & 46 Vict., c. 50. A grant of quarter sessions to a city or borough is made by the crown in council on petition of the town council. The main points in which borough differ from county quarter sessions are these:—(1) the recorder, a barrister of five years’ standing, is sole judge in place of a body of laymen; (2) the recorder has a discretion to fix his own dates for the holding of a court, as long as he holds it once every quarter of a year; it may be held more frequently if the recorder think fit or a secretary of state so direct; (3) the recorder has no power to levy a borough rate or to grant a licence for the sale of exciseable liquors by retail. In some few boroughs the recorder is judge of the borough civil court. Quarter sessions in the counties of Middlesex, Kent, and Lancaster, as also in London and the Cinque Ports, are governed by special legislation.

The jurisdiction of quarter sessions is either original or appellate.

Original Jurisdiction.—*Civil.*—This includes the levying of a county rate and its application, the appointment of a county licensing committee, and of public officers, such as the county treasurer, the public analyst, and the inspectors of weights and measures, the confirmation of bye-laws made by local authorities, the increase or alteration of polling places and petty sessional divisions, the regulation of police, and powers under various Acts of Parliament, such as the Highway Acts, and the Contagious Diseases (Animals) Act. The quarter sessions of the metropolitan counties have by 25 Geo. II. c. 36 the power of licensing music-halls, &c., within 20 miles of London.

Criminal.—Apart from statute, the commissions of justices of the peace provide that they shall reserve the graver felonies for trial at assizes. They are now forbidden by several Acts of Parliament to try a prisoner for treason or murder, or for any felony punishable without a previous conviction by penal servitude for life (such as burglary and rape), or for any of the offences enumerated in 5 & 6 Vict. c. 38, the most practically important of which are perjury, forgery, bigamy, abduction, concealment of birth, libel, bribery, and conspiracy. The procedure is by indictment, as at assizes, and the trial of offences by jury. In the case of incorrigible rogues and of sureties of the peace the quarter sessions exercise a quasi-criminal jurisdiction without a jury. They may also estreat recognizances entered into for appearance in a court of summary jurisdiction, but this part of their jurisdiction may be considered practically obsolete, as the Summary Jurisdiction Act, 1879, gives the court of summary jurisdiction power to estreat the recognizances itself.

Appellate Jurisdiction.—*Civil.*—The principal cases in which this jurisdiction is exercised are in appeals from orders of a court of summary jurisdiction as to the assessment of the poor-rate and the removal and settlement of paupers, and orders made under the Highway, Licensing, and Bastardy Acts.

Criminal.—An appeal lies to quarter sessions from a court of summary jurisdiction only where such an appeal is expressly given by statute. The appellate jurisdiction has been considerably increased by the Summary Jurisdiction Act, 1879 (42 & 43 Vict. c. 49), which allows an appeal (with certain exceptions) from every conviction or order of a court of summary jurisdiction inflicting imprisonment without the option of a fine. The appeal may be

brought in accordance with either the Act giving the appeal or the Summary Jurisdiction Act.

There is no appeal from quarter sessions on the facts, but their decision may be reviewed by the High Court of Justice by means of *certiorari*, *mandamus*, prohibition, or a case stated under 12 & 13 Vict. c. 45, § 11. A case may be stated for the opinion of the court of criminal appeal under 11 & 12 Vict. c. 78, § 1.

Ireland.—In Ireland the chairman of quarter sessions is a salaried professional lawyer, and has important civil jurisdiction corresponding very much to that of a county court judge in England. His jurisdiction depends chiefly upon 14 & 15 Vict. c. 57. The recorders of Dublin and Cork are judges of the civil bill courts in those cities.

Scotland.—In Scotland quarter sessions were established by the Act 1661, c. 338, under which justices were to meet on the first Tuesday of March, May, and August, and the last Tuesday of October to "administrate justice to the people in things that are within their jurisdiction and punish the guilty for faults and crimes done and committed in the preceding quarter." The jurisdiction of quarter sessions in Scotland is more limited than in England, much of what would be quarter-sessions work in England being done by the sheriff or the commissioners of supply. Quarter sessions have appellate jurisdiction in poaching, revenue, and licensing cases, and under the Pawnbrokers and other Acts. All appeals from proceedings under the Summary Jurisdiction Acts are taken to the High Court of Justiciary at Edinburgh or on circuit (44 & 45 Vict. c. 33). The original jurisdiction of quarter sessions is very limited, and almost entirely civil. Thus they have power to divide a county and to make rules for carrying into effect the provisions of the Small Debts Act, 6 Geo. IV. c. 48. The decision of quarter sessions may be reviewed by advocacy, suspension, or appeal.

United States.—In the United States courts of quarter sessions exist in many of the States; their jurisdiction is determined by State legislation, and extends as a rule only to the less grave crimes. They are in some States constituted of professional judges.

QUARTZ, the name of a mineralogical species which includes nearly all the native forms of silica. It thus embraces a great number of distinct minerals, several of which are cut as ornamental stones or otherwise used in the arts. For a general description of the species, see MINERALOGY, vol. xvi. p. 389; and for its chief varieties, see AGATE, vol. i. p. 277; AMETHYST, vol. i. p. 736; FLINT, vol. ix. p. 325; and JASPER, vol. xiii. p. 596. The crystallography of quartz has been fully investigated by Des Cloizeaux in his classical *Mémoire sur la cristallisation et la structure intérieure du Quartz*, Paris, 1855.

QUASSIA, the generic name given by Linnæus to a small tree of Surinam in honour of the negro Quassi or Coissi, who employed the intensely bitter bark of the tree as a remedy for fever. This bark was introduced into European medicine about the middle of the last century, and was officially recognized in the *London Pharmacopœia* of 1788. In 1809 it was replaced by the bitter wood or bitter ash of Jamaica, *Picræna excelsa*, Lindl., which was found to possess similar properties and could be obtained in pieces of much larger size. Since that date this wood has continued in use in Britain under the name of quassia to the exclusion of the Surinam quassia, which, however, is still employed in France and Germany. *Picræna excelsa*, Lindl. (*Quassia excelsa*, Swartz) is a tree 50 to 60 feet in height, and resembles the common ash in appearance. It has imparipinnate leaves composed of four or five pairs of short-stalked, oblong, blunt, leathery leaflets, and inconspicuous green flowers. The fruit consists of shining drupes about the size of a pea. It is found also in Antigua and St Vincent. *Quassia amara*, L., is a shrub or small tree belonging to the same natural order as *Picræna*, viz., *Simarubaceæ*, but is readily distinguished by its large handsome red flowers arranged in terminal clusters. It is a native of Panama, Venezuela, Guiana, and northern Brazil. Jamaica quassia is imported into England in logs several feet in length and often nearly one foot in thickness, consisting of pieces of the trunk and larger branches. The thin greyish bark is usually removed. The wood is nearly white, or of a yellowish tint, but sometimes exhibits blackish markings due to the

mycelium of a fungus. The wood has a pure bitter taste, and is without odour or aroma. It is usually to be met with in the form of turnings or raspings, the former being obtained in the manufacture of the "bitter cups" which are made of this wood. The medicinal properties are due to the presence of quassiin (first obtained by Winckler in 1835), which exists in the wood to the extent of $\frac{1}{10}$ th per cent. It is a neutral crystalline substance, soluble in hot dilute alcohol and chloroform and in 200 parts of water. It is also readily soluble in alkalies, and is reprecipitated by acids. It is almost insoluble in ether, and forms an insoluble compound with tannin.

Quassia is used in medicine in the form of infusion and tincture as a pure bitter tonic and febrifuge, and in consequence of containing no tannin is often prescribed in combination with iron. An infusion of the wood sweetened with sugar is also used as a fly poison, and forms an effectual injection for destroying thread worms. Quassia also forms a principal ingredient of several "hop substitutes," for which use it was employed as long ago as 1791, when John Lindsay, a medical practitioner in Jamaica, wrote that the bark was exported to England "in considerable quantities for the purposes of brewers of ale and porter."

QUATERNIONS. The word quaternion properly means "a set of four." In employing such a word to denote a new mathematical method, Sir W. R. HAMILTON (*q.v.*) was probably influenced by the recollection of its Greek equivalent, the Pythagorean Tetractys, the mystic source of all things.

Quaternions (as a mathematical method) is an extension, or improvement, of Cartesian geometry, in which the artifices of coordinate axes, &c., are got rid of, all directions in space being treated on precisely the same terms. It is therefore, except in some of its degraded forms, possessed of the perfect isotropy of Euclidian space.

From the purely geometrical point of view, a quaternion may be regarded as *the quotient of two directed lines in space*—or, what comes to the same thing, as *the factor, or operator, which changes one directed line into another*. Its analytical definition cannot be given for the moment; it will appear in the course of the article.

History of the Method.—The evolution of quaternions belongs in part to each of two weighty branches of mathematical history—the interpretation of the *imaginary* (or *impossible*) quantity of common algebra, and the Cartesian application of algebra to geometry. Sir W. R. Hamilton was led to his great invention by keeping geometrical applications constantly before him while he endeavoured to give a real significance to $\sqrt{-1}$. We will therefore confine ourselves, so far as his predecessors are concerned, to attempts at interpretation which had geometrical applications in view.

One geometrical interpretation of the negative sign of algebra was early seen to be mere *reversal* of direction along a line. Thus, when an image is formed by a plane mirror, the distance of any point in it from the mirror is simply the negative of that of the corresponding point of the object. Or if motion in one direction along a line be treated as positive, motion in the opposite direction along the same line is negative. In the case of time, measured from the Christian era, this distinction is at once seen by the letters A.D. or B.C., prefixed to the date. And to find the position, in time, of one event relatively to another, we have only to subtract the date of the second (taking account of its sign) from that of the first. Thus to find the interval between the battles of Marathon (490 B.C.) and Waterloo (1815 A.D.) we have

$$+1815 - (-490) = 2305 \text{ years.}$$

And it is obvious that the same process applies in all cases in which we deal with quantities which may be regarded as of one directed dimension only, such as distances along a line, rotations about an axis, &c. But it

is essential to notice that this is by no means necessarily true of operators. To turn a line through a certain angle in a given plane, a certain operator is required; but when we wish to turn it through an equal negative angle we must not, in general, employ the negative of the former operator. For the negative of the operator which turns a line through a given angle in a given plane will in all cases produce the negative of the original result, which is not the result of the reverse operator, unless the angle involved be an odd multiple of a right angle. This is, of course, on the usual assumption that the sign of a product is changed when that of any one of its factors is changed, —which merely means that -1 is commutative with all other quantities.

The celebrated Wallis seems to have been the first to push this idea further. In his *Treatise of Algebra* (1685) he distinctly proposes to construct the imaginary roots of a quadratic equation by going out of the line on which the roots, if real, would have been constructed.

In 1804 the Abbé Buée,¹ apparently without any knowledge of Wallis's work, developed this idea so far as to make it useful in geometrical applications. He gave, in fact, the theory of what in Hamilton's system is called *Composition of Vectors in one plane*—i.e., the combination, by $+$ and $-$, of coplanar directed lines. His constructions are based on the idea that the imaginaries $\pm\sqrt{-1}$ represent a unit line, and its reverse, perpendicular to the line on which the real units ± 1 are measured. In this sense the imaginary expression $a + b\sqrt{-1}$ is constructed by measuring a length a along the fundamental line (for real quantities), and from its extremity a line of length b in some direction perpendicular to the fundamental line. But he did not attack the question of the representation of products or quotients of directed lines. The step he took is really nothing more than the kinematical principle of the composition of linear velocities, but expressed in terms of the algebraic imaginary.

In 1806 (the year of publication of Buée's paper) Argand published a pamphlet² in which precisely the same ideas are developed, but to a considerably greater extent. For an interpretation is assigned to the product of two directed lines in one plane, when each is expressed as the sum of a real and an imaginary part. This product is interpreted as another directed line, forming the fourth term of a proportion, of which the first term is the real (positive) unit-line, and the other two are the factor-lines. Argand's work remained unnoticed until the question was again raised in *Gergonne's Annales*, 1813, by Français. This writer stated that he had found the germ of his remarks among the papers of his deceased brother, and that they had come from Legendre, who had himself received them from some one unnamed. This led to a letter from Argand, in which he stated his communications with Legendre, and gave a résumé of the contents of his pamphlet. In a further communication to the *Annales*, Argand pushed on the applications of his theory. He has given by means of it a simple proof of the existence of n roots, and no more, in every rational algebraic equation of the n th order with real coefficients. About 1828 Warren in England, and Mourey in France, independently of one another and of Argand, reinvented these modes of interpretation; and still later, in the writings of

Cauchy, Gauss, and others, the properties of the expression $a + b\sqrt{-1}$ were developed into the immense and most important subject now called the *theory of complex numbers* (see NUMBERS, THEORY OF). From the more purely symbolical view it was developed by Peacock, De Morgan, &c., as *double algebra*.

Argand's method may be put, for reference, in the following form. The directed line whose length is a , and which makes an angle θ with the real (positive) unit line, is expressed by

$$a(\cos \theta + i \sin \theta),$$

where i is regarded as $+\sqrt{-1}$. The sum of two such lines (formed by adding together the real and the imaginary parts of two such expressions) can, of course, be expressed as a third directed line—the diagonal of the parallelogram of which they are conterminous sides. The product, P , of two such lines is, as we have seen, given by

$$1 : a(\cos \theta + i \sin \theta) :: a'(\cos \theta' + i \sin \theta') : P,$$

or $P = aa' \{ \cos(\theta + \theta') + i \sin(\theta + \theta') \}$. Its length is, therefore, the product of the lengths of the factors, and its inclination to the real unit is the sum of those of the factors. If we write the expressions for the two lines in the form $A + Bi$, $A' + B'i$, the product is $AA' - BB' + i(AB' + BA')$; and the fact that the length of the product line is the product of those of the factors is seen in the form

$$(A^2 + B^2)(A'^2 + B'^2) = (AA' - BB')^2 + (AB' + BA')^2.$$

In the modern theory of complex numbers this is expressed by saying that the *Norm* of a product is equal to the product of the norms of the factors.

Argand's attempts to extend his method to space generally were fruitless. The reasons will be obvious later; but we mention them just now because they called forth from Servois (*Gergonne's Annales*, 1813) a very remarkable comment, in which was contained the only yet discovered trace of an anticipation of the method of Hamilton. Argand had been led to deny that such an expression as i^2 could be expressed in the form $A + Bi$,—although, as is well known, Euler showed that one of its values is a real quantity, the exponential function of $-\pi/2$. Servois says, with reference to the general representation of a directed line in space:—

“L'analogie semblerait exiger que le trinôme fût de la forme $p \cos \alpha + q \cos \beta + r \cos \gamma$; α, β, γ étant les angles d'une droite avec trois axes rectangulaires; et qu'on eût

$$(p \cos \alpha + q \cos \beta + r \cos \gamma)(p' \cos \alpha + q' \cos \beta + r' \cos \gamma)$$

$= \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$. Les valeurs de p, q, r, p', q', r' qui satisfaisaient à cette condition seraient absurdes; mais seraient-elles imaginaires, reductibles à la forme générale $A + B\sqrt{-1}$? Voilà une question d'analyse fort singulière que je soumets à vos lumières. La simple proposition que je vous en fais suffit pour vous faire voir que je ne crois point que toute fonction analytique non réelle soit vraiment reductible à la forme $A + B\sqrt{-1}$.”

As will be seen later, the fundamental i, j, k of quaternions, with their reciprocals, furnish a set of six quantities which satisfy the conditions imposed by Servois. And it is quite certain that they cannot be represented by ordinary imaginaries.

Something far more closely analogous to quaternions than anything in Argand's work ought to have been suggested by De Moivre's theorem (1730). Instead of regarding, as Buée and Argand had done, the expression $a(\cos \theta + i \sin \theta)$ as a directed line, let us suppose it to represent the operator which, when applied to any line in the plane in which θ is measured, turns it in that plane through the angle θ , and at the same time increases its length in the ratio $a : 1$. From the new point of view we see at once, as it were, why it is true that

$$(\cos \theta + i \sin \theta)^m = \cos m\theta + i \sin m\theta.$$

For this equation merely states that m turnings of a line through successive equal angles, in one plane, give the same result as a single turning through m times the common angle. To make this process applicable to any plane in space, it is clear that we must have a special value of i for each such plane. In other words, a unit line, drawn in any direction whatever, must have -1 for its square. In such

² *Essai sur une manière de représenter les Quantités Imaginaires dans les Constructions Géométriques*. A second edition was published by Hoüel (Paris, 1874). There is added an important *Appendix*, consisting of the papers from *Gergonne's Annales* which are referred to in the text above. Almost nothing can, it seems, be learned of Argand's private life, except that in all probability he was born at Geneva in 1768.

a system there will be no line in space specially distinguished as the *real unit line*: all will be alike imaginary, or rather alike real. We may state, in passing, that every quaternion can be represented as $a(\cos\theta + \epsilon\sin\theta)$,—where a is a real number, θ a real angle, and ϵ a directed unit line whose square is -1 . Hamilton took this grand step, but, as we have already said, without any help from the previous work of De Moivre. The course of his investigations is minutely described in the preface to his first great work¹ on the subject. Hamilton, like most of the many inquirers who endeavoured to give a real interpretation to the imaginary of common algebra, found that at least two kinds, orders, or ranks of quantities were necessary for the purpose. But, instead of dealing with points on a line, and then wandering out at right angles to it, as Buée and Argand had done, he chose to look on algebra as the science of *pure time*,² and to investigate the properties of “sets” of time-steps. In its essential nature a set is a linear function of any number of *distinct* units of the same species. Hence the simplest form of a set is a *couple*; and it was to the possible laws of combination of couples that Hamilton first directed his attention. It is obvious that the way in which the two separate time-steps are involved in the couple will determine these laws of combination. But Hamilton’s special object required that these laws should be such as to lead to certain assumed results; and he therefore commenced by assuming these, and from the assumption determined how the separate time-steps must be involved in the couple. If we use Roman letters for mere numbers, capitals for instants of time, Greek letters for time-steps, and a parenthesis to denote a couple, the laws assumed by Hamilton as the basis of a system were as follows:—

$$(B_1, B_2) - (A_1, A_2) = (B_1 - A_1, B_2 - A_2) = (\alpha, \beta);$$

$$(a, b)(\alpha, \beta) = (a\alpha - b\beta, b\alpha + a\beta).^3$$

To show how we give, by such assumptions, a real interpretation to the ordinary algebraic imaginary, take the simple case $a=0, b=1$, and the second of the above formulæ gives

$$(0, 1)(\alpha, \beta) = (-\beta, \alpha).$$

Multiply once more by the number-couple $(0, 1)$, and we have

$$(0, 1)(0, 1)(\alpha, \beta) = (0, 1)(-\beta, \alpha) = (-\alpha, -\beta)$$

$$= (-1, 0)(\alpha, \beta) = -(\alpha, \beta).$$

Thus the number-couple $(0, 1)$, when twice applied to a step-couple, simply changes its sign. That we have here a perfectly *real* and intelligible interpretation of the ordinary algebraic imaginary is easily seen by an illustration, even if it be a somewhat extravagant one. Some Eastern potentate, possessed of absolute power, covets the vast possessions of his vizier and of his barber. He determines to rob them both (an operation which may be very satisfactorily expressed by -1); but, being a wag, he chooses his own way of doing it. He degrades his vizier to the office of barber, taking all his goods in the process; and makes the barber his vizier. Next day he repeats the operation. Each of the victims has been restored to his former rank, but the operator -1 has been applied to both.

Hamilton, still keeping prominently before him as his great object the invention of a method applicable to space of three dimensions, proceeded to study the properties of *triplets* of the form $x + iy + jz$, by which he proposed to represent the directed line in space whose projections on

the coordinate axes are x, y, z . The composition of two such lines by the algebraic addition of their several projections agreed with the assumption of Buée and Argand for the case of coplanar lines. But, assuming the *distributive* principle, the product of two lines appeared to give the expression

$$xx' - yy' - zz' + i(yx' + xy') + j(xz' + zx') + i(yz' + zy').$$

For the square of j , like that of i , was assumed to be negative unity. But the interpretation of ij presented a difficulty,—in fact *the main difficulty* of the whole investigation,—and it is specially interesting to see how Hamilton attacked it. He saw that he could get a hint from the simpler case, already thoroughly discussed, provided the two factor lines were in one plane through the real unit line. This requires merely that

$$y : z :: y' : z'; \text{ or } yz' - zy' = 0;$$

but then the product should be of the same form as the separate factors. Thus, in this special case, the term in ij ought to vanish. But the numerical factor appears to be $yz' + zy'$, while it is the quantity $yz' - zy'$ which really vanishes. Hence Hamilton was at first inclined to think that ij must be treated as *nil*. But he soon saw that “a less harsh supposition” would suit the simple case. For his speculations on sets had already familiarized him with the idea that multiplication might in certain cases not be commutative; so that, as the last term in the above product is made up of the two separate terms $ijyz'$ and $jizy'$, the term would vanish of itself when the factor-lines are coplanar provided $ij = -ji$, for it would then assume the form $ij(yz' - zy')$. He had now the following expression for the product of any two directed lines

$$xx' - yy' - zz' + i(yx' + xy') + j(xz' + zx') + ij(yz' - zy').$$

But his result had to be submitted to another test, the Law of the Norms. As soon as he found, by trial, that this law was satisfied, he took the final step. “This led me,” he says, “to conceive that perhaps, instead of seeking to *confine* ourselves to *triplets*, . . . we ought to regard these as only *imperfect forms* of Quaternions, . . . and that thus my old conception of *sets* might receive a new and useful application.” In a very short time he settled his fundamental assumptions. He had now three distinct space-units i, j, k ; and the following conditions regulated their combination by multiplication:—

$$i^2 = j^2 = k^2 = -1, \quad ij = -ji = k, \quad jk = -kj = i, \quad ki = -ik = j.^4$$

And now the product of two quaternions could be at once expressed as a third quaternion, thus—

$$(a + ib + jc + kd)(a' + ib' + jc' + kd') = A + iB + jC + kD,$$

where

$$A = aa' - bb' - cc' - dd',$$

$$B = ab' + ba' + cd' - dc',$$

$$C = ac' + ca' + db' - bd',$$

$$D = ad' + da' + bc' - cb'.$$

Hamilton at once found that the Law of the Norms holds,—not being aware that Euler had long before decomposed the product of two sums of four squares into this very set of four squares. And now a directed line in space came to be represented as $ix + jy + kz$, while the product of two lines is the quaternion

$$-(xx' + yy' + zz') + i(yx' - zy') + j(xz' - zx') + k(xy' - yx').$$

To any one acquainted, even to a slight extent, with the elements of Cartesian geometry of three dimensions, a glance at the extremely suggestive constituents of this expression shows how justly Hamilton was entitled to say—“When the conception . . . had been so far unfolded and fixed in my mind, I felt that the *new instrument for applying calculation to geometry*, for which I had so long

¹ *Lectures on Quaternions*, Dublin, 1853.

³ Compare these with the long-subsequent ideas of Grassmann, presently to be described.

⁴ It will be easy to see that, instead of the last three of these, we may write the single one $ijk = -1$.

sought, was now, at least in part, attained." The date of this memorable discovery is October 16, 1843.

We can devote but a few lines to the consideration of the expression above. Suppose, for simplicity, the factor-lines to be each of unit length. Then x, y, z, x', y', z' express their direction-cosines. Also, if θ be the angle between them, and x'', y'', z'' the direction-cosines of a line perpendicular to each of them, we have $xx' + yy' + zz' = \cos \theta$, $yz' - zy' = x'' \sin \theta$, &c., so that the product of two unit lines is now expressed as $-\cos \theta + (ix'' + jy'' + kz'') \sin \theta$. Thus, when the factors are parallel, or $\theta = 0$, the product, which is now the square of any (unit) line, is -1 . And when the two factor lines are at right angles to one another, or $\theta = \pi/2$, the product is simply $ix'' + jy'' + kz''$, the unit line perpendicular to both. Hence, and in this lies the main element of the symmetry and simplicity of the quaternion calculus, *all systems of three mutually rectangular unit lines in space have the same properties as the fundamental system i, j, k* . In other words, if the system (considered as rigid) be made to turn about till the first factor coincides with i and the second with j , the product will coincide with k . This fundamental system, therefore, becomes unnecessary; and the quaternion method, in every case, takes its reference lines solely from the problem to which it is applied. It has therefore, as it were, a unique internal character of its own.

Hamilton, having gone thus far, proceeded to evolve these results from a train of *a priori* or metaphysical reasoning, which is so interesting in itself, and so characteristic of the man, that we briefly sketch its nature.

Let it be supposed that the product of two directed lines is something which has quantity; *i.e.*, it may be halved, or doubled, for instance. Also let us assume (*a*) space to have the same properties in all directions, and make the convention (*b*) that to change the sign of any one factor changes the sign of a product. Then the product of two lines which have the same direction *cannot be*, even in part, a directed quantity. For, if the directed part have the same direction as the factors, (*b*) shows that it will be reversed by reversing either, and therefore will recover its original direction when both are reversed. But this would obviously be inconsistent with (*a*). If it be perpendicular to the factor lines, (*a*) shows that it must have simultaneously every such direction. Hence it *must* be a mere number.

Again, the product of two lines at right angles to one another cannot, even in part, be a number. For the reversal of either factor must, by (*b*), change its sign. But, if we look at the two factors in their new position by the light of (*a*), we see that the sign must not change. But there is nothing to prevent its being represented by a directed line if, as farther applications of (*a*) and (*b*) show we must do, we take it perpendicular to each of the factor lines. Hamilton seems never to have been quite satisfied with the apparent *heterogeneity* of a quaternion, depending as it does on a numerical and a directed part. He indulged in a great deal of speculation as to the existence of an *extra-spatial unit*, which was to furnish the *raison d'être* of the numerical part, and render the quaternion *homogeneous* as well as linear. But, for this, we must refer to his own works.

Hamilton was not the only worker at the theory of sets. The year after the first publication of the quaternion method, there appeared a work of great originality, by Grassmann,¹ in which results closely analogous to some of those of Hamilton were given. In particular two species of multiplication ("inner" and "outer") of directed lines in one plane were given. The results of these two

kinds of multiplication correspond respectively to the numerical and the directed parts of Hamilton's quaternion product. But Grassmann distinctly states in his preface that he had not had leisure to extend his method to angles in space. Hamilton and Grassmann, while their earlier work had much in common, had very different objects in view. Hamilton, as we have seen, had geometrical application as his main object; when he realized the quaternion system, he felt that his object was gained, and thenceforth confined himself to the development of his method. Grassmann's object seems to have been, all along, of a much more ambitious character, *viz.*, to discover, if possible, a system or systems in which every conceivable mode of dealing with sets should be included. That he made very great advances towards the attainment of this object all will allow; that his method, even as completed in 1862, fully attains it is not so certain. But his claims, however great they may be, can in no way conflict with those of Hamilton, whose mode of multiplying *couples* (in which the "inner" and "outer" multiplication are essentially involved) was produced in 1833, and whose quaternion system was completed and published before Grassmann had elaborated for press even the rudimentary portions of his own system, in which the veritable difficulty of the whole subject, the application to angles in space, had not even been attacked. Grassmann made in 1854 a somewhat savage onslaught on Cauchy and De St Venant, the former of whom had invented, while the latter had exemplified in application, the system of "*clefs algébriques*," which is almost precisely that of Grassmann. But it is to be observed that Grassmann, though he virtually accused Cauchy of plagiarism, does not appear to have preferred any such charge against Hamilton. He does not allude to Hamilton in the second edition of his work. But in 1877, in the *Mathematische Annalen*, xii., he gave a paper "On the Place of Quaternions in the *Ausdehnungslehre*," in which he condemns, as far as he can, the nomenclature and methods of Hamilton. There are many other systems, based on various principles, which have been given for application to geometry of directed lines, but those which deal with products of lines are all of such complexity as to be practically useless in application. Others, such as the *Barycentric Calcul* of Möbius, and the *Méthode des Equipollences* of Bellavitis, give elegant modes of treating space problems, so long as we confine ourselves to projective geometry and matters of that order; but they are limited in their field, and therefore need not be discussed here. More general systems, having close analogies to quaternions, have been given since Hamilton's discovery was published. As instances we may take Goodwin's and O'Brien's papers in the *Cambridge Philosophical Transactions* for 1849.

Relations to other Branches of Science.—Even the above brief narrative shows how close is the connexion between quaternions and the ordinary Cartesian space-geometry. Were this all, the gain by their introduction would consist mainly in a clearer insight into the mechanism of coordinate systems, rectangular or not—a very important addition to theory, but little advance so far as practical application is concerned. But we have now to consider that, as yet, we have not taken advantage of the *perfect symmetry* of the method. When that is done, the full value of Hamilton's grand step becomes evident; and the gain is quite as extensive from the practical as from the theoretical point of view. Hamilton, in fact, remarks,² "I regard it as an inelegance and imperfection in this calculus, or rather in the state to which it has hitherto been unfolded, whenever it becomes, or *seems* to become, necessary to have recourse to the resources of ordinary algebra, for the solution of equations in quaternions." This refers to the use of the x, y, z coordinates,—associated, of course, with i, j, k . But when, instead of the highly artificial expression $ix + jy + kz$, to denote a finite directed line, we employ a single letter, a (Hamilton uses the Greek alphabet for this purpose), and find that we are permitted to deal with it exactly as we should have dealt with the more complex expression, the immense gain is at least in part obvious. Any quaternion may now be expressed in numerous simple forms. Thus we may regard it as the sum of a number and a line, $a + a$, or as the product, $\beta\gamma$, or the quotient, $\delta\epsilon^{-1}$, of two directed lines, &c., while, in many cases, we may represent it, so far as it is required, by a single letter such as q, r , &c.

¹ *Die Ausdehnungslehre*, Leipsic, 1844; 2d ed., "*vollständig und in strenger Form bearbeitet*," Berlin, 1862. See also the collected works of Möbius, and those of Clifford, for a general explanation of Grassmann's method.

² *Lectures on Quaternions*, § 513.

Perhaps to the student there is no part of elementary mathematics so repulsive as is spherical trigonometry. Also, everything relating to change of systems of axes, as for instance in the kinematics of a rigid system, where we have constantly to consider one set of rotations with regard to axes fixed in space, and another set with regard to axes fixed in the system, is a matter of troublesome complexity by the usual methods. But every quaternion formula is a proposition in spherical (sometimes degrading to plane) trigonometry, and has the full advantage of the symmetry of the method. And one of Hamilton's earliest advances in the study of his system (an advance independently made, only a few months later, by Cayley) was the interpretation of the singular operator $q()$ q^{-1} , where q is a quaternion. Applied to *any* directed line, this operator at once turns it, *conically*, through a definite angle, about a definite axis. Thus rotation is now expressed in symbols at least as simply as it can be exhibited by means of a model. Had quaternions effected nothing more than this, they would still have inaugurated one of the most necessary, and apparently impracticable, of reforms.

The physical properties of a heterogeneous body (provided they vary *continuously* from point to point) are known to depend, in the neighbourhood of any one point of the body, on a quadric function of the coordinates with reference to that point. The same is true of physical quantities such as potential, temperature, &c., throughout small regions in which their variations are continuous; and also, without restriction of dimensions, of moments of inertia, &c. Hence, in addition to its geometrical applications to surfaces of the second order, the theory of quadric functions of position is of fundamental importance in physics. Here the symmetry points at once to the selection of the three principal axes as the directions for i , j , k ; and it would appear at first sight as if quaternions could not simplify, though they might improve in elegance, the solution of questions of this kind. But it is not so. Even in Hamilton's earlier work it was shown that all such questions were reducible to the *solution of linear equations in quaternions*; and he proved that this, in turn, depended on the determination of a certain operator, which could be represented for purposes of calculation by a single symbol. The method is essentially the same as that developed, under the name of "matrices" by Cayley in 1858; but it has the peculiar advantage of the simplicity which is the natural consequence of entire freedom from conventional reference lines.

Sufficient has already been said to show the close connexion between quaternions and the theory of numbers. But one most important connexion with modern physics must be pointed out, as it is probably destined to be of great service in the immediate future. In the theory of surfaces, in hydrokinetics, heat-conduction, potentials, &c., we constantly meet with what is called *Laplace's operator*, viz., $\frac{d^2}{dx^2} + \frac{d^2}{dy^2} + \frac{d^2}{dz^2}$. We know that this is an *invariant*; i.e., it is independent of the particular directions chosen for the rectangular coordinate axes. Here, then, is a case specially adapted to the isotropy of the quaternion system; and Hamilton easily saw that the expression $i \frac{d}{dx} + j \frac{d}{dy} + k \frac{d}{dz}$ could be, like $ix + jy + kz$, effectively expressed by a single letter. He chose for this purpose ∇ . And we now see that the square of ∇ is the negative of Laplace's operator; while ∇ itself, when applied to any numerical quantity conceived as having a definite value at each point of space, gives the *direction and the rate of most rapid change* of that quantity. Thus, applied to a potential, it gives the direction and magnitude of the force; to a distribution of

temperature in a conducting solid, it gives (when multiplied by the conductivity) the flux of heat, &c. No better testimony to the value of the quaternion method could be desired than the constant use made of its notation by mathematicians like Clifford (in his *Kinematic*) and by physicists like Clerk-Maxwell (in his *Electricity and Magnetism*). Neither of these men professed to employ the calculus itself, but they recognized fully the extraordinary clearness of insight which is gained even by merely translating the unwieldy Cartesian expressions met with in hydrokinetics and in electrodynamics into the pregnant language of quaternions.

Works on the Subject.—Of course the great works on this subject are the two immense treatises by Hamilton himself. Of these the second (*Elements of Quaternions*, London, 1866) was posthumous—incomplete in one short part of the original plan only, but that a most important part, the theory and applications of ∇ . These two works, along with Hamilton's other papers on quaternions (in the *Dublin Proceedings and Transactions*, the *Philosophical Magazine*, &c.), are storehouses of information, of which but a small portion has yet been extracted. A German translation of Hamilton's *Elements* has recently been published by Glan.

Other works on the subject, in order of date, are Allegrè, *Essai sur le Calcul des Quaternions* (Paris, 1862); Tait, *An Elementary Treatise on Quaternions* (Oxford 1867, 2d ed. 1873; German translation by v. Scherff, 1880, and French by Plarr, 1882–84); Kelland and Tait, *Introduction to Quaternions* (London, 1873, 2d ed. 1882); Houël, *Éléments de la Théorie des Quaternions* (Paris, 1874); Unverzagt, *Theorie der Quaternionen* (Wiesbaden, 1876); Laisant, *Introduction à la Méthode des Quaternions* (Paris, 1881); Graefe, *Vorlesungen über die Theorie der Quaternionen* (Leipzig, 1884).

An excellent article on the "Principles" of the science, by Dillner, will be found in the *Mathematische Annalen*, vol. xi., 1877. And a very valuable article on the general question, *Linear Associated Algebra*, by the late Prof. Peirce, was unfortunately lithographed for private circulation only. Sylvester and others have recently published extensive contributions to the subject, including quaternions under the general class *matrix*, and have developed much farther than Hamilton lived to do the solution of equations in quaternions. Several of the works named above are little more than compilations, and some of the French ones are painfully disfigured by an attempt to introduce an improvement of Hamilton's notation; but the mere fact that so many have already appeared shows the sure progress which the method is now making. (P. G. T.)

QUATREMÈRE, ÉTIENNE MARC (1782–1857), one of the most learned of modern Orientalists, came of an eminent family of Parisian merchants. His father was a victim of the Revolution, his mother a pious woman devoted to works of charity and venerated after her death almost as a saint. The son retained much of what was best in the old spirit of the Parisian *bourgeoisie*—its industry, sobriety, and independence of character, along with a certain narrowness of view. He was sincerely religious, with strong Jansenist and Gallican tendencies, a touch of rationalism, and a great dislike of modern growths of Catholicism. His whole life was spent alone among his books, and his works always display the most extensive and accurate erudition—in which indeed, and not in criticism or original ideas, his strength lay. Employed in 1807 in the manuscript department of the imperial library, he passed to the chair of Greek in Rouen in 1809, entered the academy of inscriptions in 1815, taught Hebrew and Aramaic in the Collège de France from 1819, and finally in 1827 became professor of Persian in the School of Living Oriental Languages.

Quatremère's first work was *Recherches sur la langue et la littérature de l'Égypte* (1808), showing that the language of ancient Egypt must be sought in Coptic. His *Mém. sur les Nabatéens* (1835) has been mentioned under NABATÆANS, and his translation of MAKRIZI's history of the Mameluke sultans in the article on that author. The valuable notes to the latter book show his erudition at the best. He published also among other works a translation of Rashid al-Din's *Hist. des Mongols de la Perse* (1836); *Mém. géog. et hist. sur l'Égypte* (1810); the text of Ibn Khaldūn's *Prolegomena*; and a vast number of useful memoirs in the *Jour. As.* His numerous reviews in the *Jour. des Savants* should also be mentioned. Quatremère made great lexicographic collections in Oriental languages, fragments of which appear in the notes to his

various works. His MS. material for Syriac has been utilized in Payne Smith's *Thesaurus*; of the slips he collected for a projected Arabic, Persian, and Turkish lexicon some account is given in the preface to Dozy, *Suppl. aux Dict. Arabes*. They are now in the Munich library.

Plate II.

QUEBEC, a province of Canada in British North America, lying between 52° 30' and 45° N. lat., and between 57° 7' and 79° 33' 20" W. long., and bounded on the N. by Labrador and Hudson's Bay, on the E. by Labrador and the Gulf of St Lawrence, on the S. by the Bay of Chaleurs, New Brunswick, and the States of Maine, New Hampshire, Vermont, and New York, and on the S.W. and W. by the river Ottawa and the province of Ontario. Its length, from Lake Temiscamingue to Anse au Sablon in the Straits of Belle Isle, is nearly 1000 miles on a due east and west course, and from Lake Temiscamingue to Cape Gaspé it is 700 miles; its breadth is 300 miles, and the area 188,694 square miles (120,764,651 acres). The surface of the country is exceedingly varied and picturesque, embracing several ridges of mountains and lofty hills, diversified by numerous rivers, lakes, and forests. There are many islands of great fertility and beauty, cascades and falls of considerable height, and extensive tracts of cultivable land, rendering the scenery everywhere bold and striking. Mountain ranges extend from south-west to north-east and run parallel to each other. The Notre Dame or Green Mountains, which are a continuation of the Appalachian range, extend along nearly the whole of the south side of the St Lawrence, terminating at the gulf of the same name, between the Bay of Chaleurs and Gaspé Point, where they form an elevated table-land 1500 feet high. Their chief summits are Mount Logan and Mount Murray, very nearly 4000 feet high. In the eastern townships the mountains of this range are capable of cultivation. The Laurentian range (called by Garneau the Laurentides) skirts the northern bank of the St Lawrence, forming undulating ridges of 1000 feet in elevation, and extending from Labrador to the vicinity of Quebec, where it leaves the river. Keeping nearly parallel with it until within 30 miles west of Montreal, it rounds the Ottawa for 100 miles, crosses it, and curves in the direction of Kingston. From this point the range extends north-westward to the shores of Lakes Huron and Superior. The Mealy Mountains, stretching from 75° W. lat. to Sandwich Bay, are always covered with snow, and are about 1500 feet high. There are many rocky masses connected with the mountain chains lining the St Lawrence which form precipitous cliffs, often rising to a considerable height. Some of the hills of the Laurentian range are 1300 feet high, and below the city of Québec their altitude is 3000 feet. They enclose numberless small lakes, many of which are still unexplored.

Mountains.

Rivers.

The whole country is exceptionally well watered, and abounds in numerous large rivers, bays, and lakes. The principal river is the ST LAWRENCE (*q.v.*), which flows through the entire length of the province. A short distance above Montreal it receives from the north-west the Ottawa, an interesting and beautiful stream over 600 miles in length, with its tributaries the Gatineau, the Lièvre, and the Rouge. The St Lawrence is navigable for ships of the line as far as Quebec, and for steamships of over 5000 tons to Montreal. Between Montreal and Lake Ontario the navigation is interrupted by rapids, the most important of which are the Cedar and Lachine Rapids, the latter about 9 miles above Montreal. The total elevation between tide water and Lake Ontario is about 230 feet. This is overcome by eight canals, varying from $\frac{3}{4}$ mile to $11\frac{1}{2}$ miles in length, in the aggregate only 41 miles of canals, with locks 200 feet long between the gates, and 45 feet wide. The St Maurice, rising in Lake Oskelaneo near the Hudson's Bay Territory, and flowing into the St

Lawrence at Three Rivers, is over 400 miles long. It has many tributaries, and drains an area of 21,000 square miles. Twenty-four miles above Three Rivers is the fall of Shawenegan, 150 feet high. The Batiscan river enters the St Lawrence at Batiscan. Jacques Cartier, Ste Anne, and Montmorency are all on the northern side of the St Lawrence. The Montmorency is famous for its falls—situated about 8 miles from Quebec city, 250 feet high—and the natural steps on its rocky bank, $1\frac{1}{2}$ miles above the cataract. Near the falls is Haldimand House, once the residence of the duke of Kent, father of Queen Victoria. The Saguenay, sometimes called the River of Death, is one of the most remarkable bodies of water in the world.¹ It rises in Lake St John, and discharges into the St Lawrence at Tadousac, after a course of 100 miles. At its mouth the Saguenay is $2\frac{1}{2}$ miles wide, and the depth exceeds 100 fathoms. The depth in other parts varies from 100 to 1000 feet. In the upper part of the river are many pretty falls and rapids. The Saguenay is navigable for large vessels as far as Chicoutimi, 98 miles from the mouth of the river. Fifteen miles south of Chicoutimi there recedes from the Saguenay Ha Ha Bay, at the head of which is the village of St Alphonse. On the south side of the St Lawrence is the Richelieu river, which drains Lake Champlain, and enters Lake St Peter at Sorel, and flows in a northerly direction for 75 miles. Champlain sailed up this river in 1609. Other important streams are the St Francis, rising in Lake Memphremagog; the Chaudière, the outlet of Lake Megantic, with its beautiful falls, 125 feet high, and situated 10 miles above Quebec; the Chateauguay, Yamaska, Etchemin, Loup, Assumption, Becancour, and North. All these rivers are navigable, and contain fish. Besides the rapids mentioned, there are situated a short distance above Rigaud on the Ottawa the Carillon Falls, a series 12 miles in length. Near Ottawa city are the Chaudière Falls, or "boiling pot," less than 40 feet in height, and extending over 6 miles. Les Chats, a series of rapids 30 miles further up the Ottawa, are striking and grand. At Calumet there is another rapid. The Falls of Ste Anne are on the north shore of the St Lawrence, 22 miles below Quebec; the Falls of St Fereol, the Long Sault, Cedars, and Lachine Rapids by no means complete the list.

The principal lakes are Lake St John, which possesses an area of 360 square miles, Lake Temiscamingue, 126 miles, St Peter, Metapedia, Kempt, Megantic, Memphremagog, Pimpuakan, the northern part of Lake Champlain, Manouan, Grand Wayagamack, Asturagamicook, Piscatonque, Kakebonga, Mijizowaja, Keepawa, Papimonagace, Edward, Matawin, St Louis, Massawipi, Pamouscachiou, Graves, Grand, St Francis, and hundreds of others of lesser note, and all stocked with fish. The chief bays along the coasts are Chaleurs (in part), with its bold and precipitous cliffs, Malbaie, Mille Vaches, Ha Ha, &c. Quebec's principal islands are Anticosti, sterile and almost uninhabited, Bonaventure, an important fishing station to the east of Gaspé, and the Magdalen Islands, situated in the Gulf of St Lawrence, about 50 miles north of Prince Edward Island. This group is inhabited by about 3200 persons, mostly French fishermen. Other islands are the island of Montreal, St Helen's, Jesus, the island of Orleans, 22 miles long, below Quebec, Grosse Isle, Isle aux Coudres, Hare, Bic Island,—all in the St Lawrence; and the islands of Calumet and Allumette in the Ottawa river.

¹ Bayard Taylor says it is "not properly a river. It is a tremendous chasm, like that of the Jordan Valley and the Dead Sea, cleft for 60 miles through the heart of a mountainous wilderness. Everything is hard, naked, stern, silent. Dark grey cliffs of granite gneiss rise from the pitch-black water; firs of gloomy-green are rooted in their crevices and fringe their summits; loftier ranges of a dull indigo hue show themselves in the background; and over all bends a pale, cold, northern sky."

Geology
and
minerals.

Beginning with the oldest rocks, the more northern part of the province of Quebec is based on the Laurentian system of Sir William Logan. This includes both the Laurentian proper and an overlying formation largely composed of Labrador and anorthite felspars, to which Sir William Logan gave the name Upper Laurentian, though it is now more usually known by the name Norian, applied to similar rocks in Scandinavia. This Upper Laurentian formation occupies but limited areas, one of which is near Lake St John, and another to the east of St Jerome, not far from Montreal. The Lower Laurentian of Logan, on the other hand, including the Ottawa or Trembling Mountain group and the Grenville series, extends from the Straits of Belle Isle to the Ottawa river in a continuous belt. It consists largely of gneiss and crystalline schists, and holds thick beds of limestone and beds of iron ore and veins of apatite. It is the chief seat of the iron and phosphate mining industries, and contains also the principal deposits of graphite or plumbago. It is on this formation that the remarkable forms, discovered by Dr Dawson (now Sir William), known as *Eozoon canadense*, and supposed to be the earliest form of animal life, occur.

The Laurentian formation is succeeded in the western part of the province by the Potsdam sandstone, a probable equivalent in age of the Upper Cambrian of Britain. On this rests a dolomitic limestone—the Calciferous formation,—and on this the great and richly fossiliferous limestones of the Lower Silurian (Ordovician) age known as the Chazy and Trenton groups. These limestones afford the best building-stone of the province, while the Potsdam sandstone also affords a good stone of construction. Above the Trenton is the Utica shale, a dark-coloured argillaceous deposit, rich in graptolites and trilobites, and on this is the Hudson River group, consisting largely of sandstones and calcareous beds.

To the south-west of these rocks lie Upper Silurian and Devonian beds, the latter holding fossil plants and fishes, and at the extreme south-eastern part of the province, on the Bay of Chaleurs, is the outlier of the Lower Carboniferous area of New Brunswick. It is not likely that any true coal occurs in the province, though veins of hardened bitumen are found locally in the beds next to be noticed.

From Quebec eastward along the St Lawrence occurs a great series of argillaceous and arenaceous beds, the equivalents of the Upper Cambrian and Lower Silurian of the interior districts, but deposited under different conditions, and abounding in some peculiar forms of trilobites and graptolites. In their extension to the southward they pass into the United States. Near the boundary they begin to be associated with various crystalline rocks. These were regarded by Sir William Logan as altered Silurian beds of the Quebec group; but later observers (MacFarlane, Selwyn, and Hunt) have maintained that they are, in part at least, of greater age. They contain several important economic minerals—gold, copper, and iron ores, chrysolite used as asbestos, chromic iron, and serpentine; marble and roofing slates are found in associated beds believed to be of Silurian age.

A large part of the country, more especially on the lower levels, is covered with Pleistocene deposits of the so-called Glacial age. The lower part of these beds consists of tile or boulder-clay with local and Laurentian boulders, and in some places a few marine shells of northern species. On this rests a finer blue clay, in some places rich in fossil shells, and known as the Leda clay. It affords a good material for the manufacture of bricks and tiles. Above the Leda clay are sands and gravels, often with travelled boulders, and named the Saxicava sand, from a shell found very abundantly in some portions of their lower part. These superficial deposits appear to imply submergence

and driftage of thick ice-fields with local glaciers descending from the mountains. The prevalent directions of glacial striations is north-east and south-west or parallel to the course of the St Lawrence valley.

In certain alluvial deposits in the vicinity of the St Maurice river there occur workable deposits of bog iron ore, which have been worked for many years.

The climate of Quebec is variable. In winter the cold Climate is generally steady, and the atmosphere is clear and bracing. The thermometer often registers 20° below zero. Snow lies on the ground from the end of November until the middle of April, affording good sleighing for five months of the year. The inhabitants enjoy with zest and spirit all the out-door sports common to the country, such as skating, curling, tobogganing, snow-shoeing, coasting, and sliding. In Montreal winter carnivals are held which attract from all parts of Canada and the United States thousands of spectators. Snow falls to a very great depth, and though the winds are often sharp they are not often raw or damp, nor is there any fog. The summer is warm and pleasant, and the extreme heat is indicated at 90°. The finest season of the year is the autumn, which lasts about six or eight weeks.

Vegetation develops rapidly in Quebec. Much of the Agriculture country is well adapted for agricultural purposes, the soil being rich and loamy, and well suited for the growth of cereals, hay, and fruit crops, all of which ripen perfectly. Wheat, barley, oats, rye, flax, pulse, buckwheat, maize, potatoes, turnips, carrots, beets, parsnips, celery, and the various roots thrive well. The principal fruits are plums, apples, melons, grapes, strawberries, raspberries, blueberries, gooseberries, cranberries, currants, and cherries. Hay has always been considered a leading crop, and much of it is exported to the United States, where it finds a ready market. Farming is carried on extensively in the eastern townships, and in all parts of the country agriculture is prosecuted with more or less activity.

The amount of land under crops in 1881 was 4,147,984 acres, and in pasture, 2,207,422 acres. The crops raised were—spring wheat, 1,999,815 bushels; winter wheat, 19,189; barley, 1,751,539; oats, 19,990,205; rye, 430,242; pease and beans, 4,170,456; buckwheat, 2,041,670; maize, 888,169; potatoes, 14,873,287; turnips, 1,572,476; other roots, 2,050,904 bushels; hay, 1,614,906 tons; grass and clover seeds, 119,306 bushels. The number of horses in 1881 was 273,852; of working oxen, 49,237; of milch cows, 490,977; of other cattle, 490,119; of sheep, 889,833; of swine, 329,199. In 1881 2,730,546 lb of wool and 559,024 lb of honey were produced.

Dense forests cover enormous tracts of territory, and afford a principal means of revenue to the province, as well as a source of industry for the people. The chief trees are white and red pine, spruce, ash, elm, beech, birch, maple, butternut, black walnut, fir, poplar, cedar, oak, cherry, hickory, basswood, &c. Upwards of fourteen hundred varieties of plants may be found, of which two hundred possess medicinal virtues. Lumbering is extensively carried on, and large quantities of dressed lumber and square timber are annually shipped to England.

The total value of the forest products exported in 1882–83 was Exports \$11,050,002; of the fisheries, \$719,799; of the mines, \$516,837; of and in animals and their produce, \$11,714,674; of agricultural products, ports. \$7,795,427; of manufactures, \$1,437,254. The grand total value of the exports was \$41,591,939, whereof produce of the province, \$33,339,549. Of late years an active trade has sprung up in the exportation of beef and cattle to England. The imports in the same year amounted to \$42,166,729 dutiable goods, and \$13,743,142 free goods; total \$55,909,871.

Shipbuilding, once a leading industry of the province, has fallen off considerably, steamships and iron vessels having superseded wooden ships in the carrying trade. The number of vessels built in Quebec during 1883 was 42, tonnage 6594. On the 31st of December 1883, the vessels registered in the province, and remaining on the registry books of the several ports, were 1733, tonnage 216,577. There were engaged in the coasting trade, including steamers and sailing vessels, 6943 craft, representing a tonnage of 1,648,550. The number of saw and grist mills in the province in 1881 was 1729, employing 12,461 hands. There were also 419 tanneries, employing 2968 hands. Other industries are shingle-making, manufactures of wool and cloth, cheese and butter making, iron-working, sash, door, and blind factories, sugar-

refining, boat-building, brewing and distilling, and the manufacture of edge tools, india-rubber goods, and boots and shoes. In 1871 the amount invested in industries in the province was \$28,071,868; in 1881 it reached \$59,216,992, when 85,673 men, women, and children were employed in the various industries, \$18,333,162 were paid out in wages, raw material to the value of \$62,563,967 was consumed, and the value of the articles produced was \$104,662,258.

Fish-eries. Quebec derives great importance from its fisheries, which are extensive and valuable, particularly those of the St Lawrence, which consist principally of cod, haddock, holi-but, salmon, mackerel, shad, white fish, herrings, lobsters, and seals. In the lakes and rivers there are salmon, trout, and bass, and the sporting streams are among the best in the world. The right of fishing in inland waters belongs to the owners of the lands in front of or through which such waters flow. The provincial government holds a large number of ungranted lands bordering on rivers and lakes, and derives an income from the leasing of fishing privileges. A fish-breeding establishment is maintained by the Dominion Government at Tadoussac, from which there are encouraging results. In 1881 there were 110 vessels and 801 men and 4779 boats and 6929 men engaged in the fisheries. The product netted in 1882 was \$1,976,515; in 1883 it was \$2,188,997.

Game. Game is plentiful in Quebec (wild duck, teal, wild geese, partridges, woodcocks, snipe, pigeons, plover, &c.). About 295 different birds exist. Of wild animals the principal are bears, wolves, cariboo, deer, lynxes, foxes, musk rats, minks, martens, squirrels, beavers, and hares.

Mineral pro-duce. Gold, iron, and copper ores abound in notable quantities. The former is found chiefly on the banks of the Chaudière in the county of Beauce. In 1881 the quantity produced was 3411 oz.; in 1883 the product was 7902 oz., realizing \$140,262. Copper is obtained in the eastern townships, and iron of superior quality abounds almost everywhere throughout the province. In 1881 the yield of this ore was 11,326 tons; of iron, 92,001; pyrites, 2300; peat, 14,597; plumbago, 270; mica, 4000 tons; building stone for dressing, 1,674,362 cubic feet; roofing slate, 4593 squares. In some sections small quantities of lead are found.

Com-munica-tion. Good wagon roads intersect the province wherever there is a settlement. In 1883 the amount expended on colonization roads by the local government was \$71,892. Telegraphic lines are established throughout the province, each line of railway, besides the great roads, having special wires. The postal facilities are excellent, and regular mails penetrate every part. Railway communication is ample and extensive, the chief lines being the Grand Trunk, the Canadian Pacific, and the Intercolonial. In 1884 Quebec had 1942 miles of railways in operation, while other lines are under construction and projected. The canal system is very complete, and commerce is greatly helped by the several waterways in operation. These are the Lachine Canal extending from Montreal to Lake St Louis; the Beauharnois Canal, uniting Lakes St Francis and St Louis; the Chambly Canal uniting Lake Champlain with the Richelieu river; and the Carillon and Grenville Canals.

Popula-tion. The province is divided into sixty-three counties, with a total area of 120,764,651 acres. Up to the 30th of June 1883 the total superficies of disposable lands surveyed and subdivided into farm lots was 6,539,160 acres. The population was 1,191,516 in 1871; in 1881 it was 1,359,027 (678,175 males and 680,852 females). The prevailing religion is that of the Roman Catholic Church, of which there are seven dioceses, viz., the archdiocese of Quebec, and the dioceses of Montreal, Three Rivers, St Hyacinthe, Sherbrooke, Rimouski, and Chicoutimi. The Protestant dioceses are two in number—Quebec and Montreal. According to the census of 1881 the religious denominations in the province were as follows:—

Church of Rome.....	1,170,718	Adventists.....	4,210
Church of England.....	68,797	Other denominations.....	5,647
Presbyterians.....	50,287	Of no religion.....	432
Methodists.....	39,220	No creed stated.....	2,609
Baptists.....	8,853	Jews.....	989
Congregationalists.....	5,244		
Universalists.....	2,021	Total.....	1,359,027

The greater portion of the population is composed of French-speaking people, natives of the soil. There are also a good many Scotch, English, and Irish, and their descendants. The Indians, mostly of the Algonquin, Iroquois, Huron, Abenakis, and Micmac tribes, number 7515, scattered in various parts of the province on reservations which they cultivate with more or less assiduity. They are peaceably disposed, and live in harmony.

Adminis-tration. The affairs of the province are administered by a lieutenant-governor and an executive council composed of six members with portfolios, assisted by a legislative assembly of sixty-five members, and a legislative council of twenty-four councillors. The latter hold their appointments for life, and the former are elected by the people every five years. The lieutenant-governor is appointed by the governor-general in council. Quebec returns to the Dominion House of Commons sixty-five representatives, and twenty-four appointees to the Dominion Senate.

The public revenue in 1883 amounted to \$4,655,757, and the Finance expenditure was \$3,962,015. The principal source of revenue is the annual subsidy granted to the province, under the terms of the B.N.A. Act of 1867, by the Dominion Government. This subsidy in 1883 amounted to \$959,252, and interest on trust funds in the hands of the Dominion Government, \$55,469. The remainder of the revenue is derived from the crown domain and timber limits, licences, stamps on law and registration documents, and other miscellaneous receipts. The administration of justice cost in 1883 the sum of \$372,400.

The judiciary consists of a Court of Queen's Bench, with a chief justice and five assistants; a superior court, with a chief justice and twenty-eight assistants; a court of review, with three judges forming a quorum; a court of vice-admiralty; courts of quarter sessions; and courts for the summary trial of petty causes. The provincial legislature meets at Quebec.

The militia (military districts Nos. 5, 6, and 7, operating under Militia the Canada Militia Act of 1883) consists of an active force by arms of the following:—cavalry, officers and men, 448; field artillery, 321; garrison artillery, 593; engineers, 87; infantry, 9885; rifles, 924; total, 12,258. The number of active militia men authorized for annual drill during 1883 was 7965. Schools of cavalry and gunnery, situated at Quebec, and one of infantry at St John's, have been established for the purpose of training officers and non-commissioned officers of the militia.

Education in Quebec is under the control of a superintendent Education and a council of public instruction appointed by the Government. The council is divided into two sections, called Roman Catholic and Protestant committees, who act independently, and, through the superintendent, control the Roman Catholic and Protestant institutions respectively. The province is divided into school municipalities containing from one to twenty-five schools each, under five commissioners elected by the people. As the school system includes religious instruction, the religious minority (Catholic or Protestant) in any municipality may separate from the majority, and organize schools of their own, under three trustees, and receive their proper share of the Government grant. Every citizen pays a tax which is levied on his property for the support of primary schools. In Montreal, Quebec, and Sherbrooke the Roman Catholics and Protestants are entirely separate for educational purposes. Thirty-six inspectors visit the schools twice a year, and report to the Government, by whom they are appointed and paid. In 1883 there were in the province 1071 municipalities, including 4404 elementary schools, 333 model schools, 246 academies, 31 colleges, 18 special schools, 3 normal schools, and 3 universities, making a total of 5038 institutions, attended by 245,225 pupils, under 6871 teachers. In support of these schools, the local contributions amounted to \$2,609,739, and the Government grant to \$352,677. The two Protestant universities are McGill University at Montreal, founded in 1821, and Bishops College at Lennoxville, founded in 1843. The Roman Catholic university (Laval) was founded by the Quebec seminary in 1852. It has a succursale at Montreal.

The public charitable institutions receiving aid from the Government are Beauport, St Ferdinand de Halifax, and St Jean de Dieu lunatic asylums. Grants are annually made to about ninety other institutions, including industrial schools and reformatories, the total amount reaching in 1883 \$301,121.

The capital is QUEBEC (*q.v.*). The largest and most important city is MONTREAL (*q.v.*). Other chief towns are Three Rivers, population 8670, so-called from the St Maurice, which here joins the St Lawrence by three mouths (it is one of the oldest cities, and the seat of a large lumber and iron trade); St Hyacinthe, 5321; Lévis, 7597, where the quarantine for cattle is situated; Sorel, 5791; St John's, 4314; St François, Beauce, 4181; Sherbrooke, 7227; Valley Field, 3906; Malbaie, 3014; Baie St Paul, 3794; St Henri, 6415; Hull, 6890; St Jean Baptiste, 5874.

The quarantine station is at Grosse Isle, an island in the river St Lawrence, 31½ miles below Quebec. It is 2½ miles long by 1 mile in width.

History.—Quebec was first visited by the French, under Jacques Cartier, in 1535, and a second time in 1536, though it is said that Sebastian Cabot discovered the country in 1497. The regular settlement of the province, however, was not made until 1608, when Samuel de Champlain landed at the site now occupied by Quebec city. Here he established military and trading posts, and it was not long before the new possession became the seat of the Récollet and Jesuit missions, which were zealously carried on under the most trying circumstances for nearly a century and a half. The early settlers endured countless hardships from the incursions of the Indians, and the frequent wars in which they were forced to engage with the English and Dutch. In 1759 the marquis of Montcalm was defeated at Quebec by an English army under General Wolfe. A year later the French surrendered all their important ports, and the colony passed under English rule. In 1763 the treaty of Paris was signed, by the terms of which, and the conditions laid down a few years later in the memorable Quebec Act of 1774, the French were guaranteed by England their

laws, language, and religion. In 1791 the province was divided into Upper and Lower Canada, but in 1841, after a series of internal dissensions, including the rebellion of 1837, and several political quarrels, the country was again united. In 1867 the provinces of old Canada, under the names of Ontario and Quebec, were erected with New Brunswick and Nova Scotia into the Dominion of Canada. (G. ST.)

QUEBEC, the ancient capital of Canada, and present capital of the province of Quebec, is situated on the north-west bank of the river St Lawrence at its junction with the St Charles, about 300 miles from the Gulf of St Lawrence and 180 miles below Montreal, in 46° 49' 6" N. lat. and 71° 13' 45" W. long. It is the most picturesque and most strongly fortified city on the continent. Quebec is built on the northern extremity of an elevated table-land which forms the left bank of the St Lawrence for a distance of 8 miles. The highest part of the headland is Cape Diamond, 333 feet above the level of the water, and crowned by the citadel, which covers an area of forty acres, and presents a bold and precipitous front on the south-east side, while towards the north and west the declivity is more sloping and gradual. The harbour of Quebec is spacious and capable of accommodating ships of the largest tonnage, and its docks and tidal basin, when completed, will rank among the most perfect works of the kind in the world. They are constructed of limestone and iron, and, including the graving dock on the Levis side of the river, will cost very nearly three millions of dollars. The harbour is protected towards the north-east by the island of Orleans, on either side of which there is an approach. The spring tides rise and fall about 18 feet. Quebec is divided into upper and lower town,—access to the former being obtained by a steep and winding street, several flights of narrow steps, and an elevator. In the lower town are situated the principal banks, merchants' offices, and wholesale and retail stores. The streets, with one or two exceptions, are narrow and irregular. In the upper town, where the streets are wider and well-paved, are the better class of dwelling houses, the public buildings, most of the churches, the public walks and gardens, retail stores and small shops. To the west are the suburbs of St John, St Louis, and St Roche. The latter occupies the lower plain, and is rapidly becoming a place of commercial importance. The other two suburbs are on the same level with the upper town. South-west of St John stretch the historic Plains of Abraham. On this battle-ground a column 40 feet high has been erected to mark the spot where General Wolfe in 1759 died victorious. In the governor's garden, which overlooks the St Lawrence, is a stately monument 65 feet in height, which is dedicated to the memory of Wolfe and Montcalm. An iron pillar surmounted by a bronze statue, the gift of Prince Napoleon Bonaparte, stands on St Foye road, and commemorates the achievements of the British and French troops in 1760. Four martello towers occupy commanding positions. A point of interest in the upper town is Dufferin Terrace, a magnificent promenade 1400 feet long and 200 feet above the level of the river. Part of this terrace occupies the site of the old Château St Louis, which was destroyed by fire in 1834. The view from the platform is very striking and beautiful. The Grand Battery also affords a fine prospect. Québec was once the walled city of the north, but several of its ancient fortifications have been dismantled, and the old gates

Environs of Quebec.

taken down. There are three gates now, instead of five as in former years, viz., St Louis, Kent, and St John's, each of which is very handsome and massive. Among the principal edifices are the parliamentary and departmental buildings,—a stately pile situated on Grande Allée,—the new court house now building, the post office, custom-house, city hall, masonic hall, the Basilica, or Roman Catholic cathedral (an irregular cut-stone building 216 feet long by 180 feet wide, and containing many fine oil paintings), the archiepiscopal palace, the Anglican cathedral (a plain structure in the Roman style), the skating rink, and the hall of the Young Men's Christian Association; four large markets supply the people with meat and country produce. There are eight Roman Catholic churches, five Church of England, two Presbyterian, one Methodist, one Baptist, one Lutheran, one Congregational, one Scandinavian, one French Protestant, and a Jewish synagogue, which is situated in the

Plan of Quebec.

Masonic Hall. Laval University, which derives its name from the first bishop of Quebec, who founded in 1663 the seminary for the training of priests, is the principal educational establishment of the Roman Catholics. It was instituted in 1852 by a royal charter from Queen Victoria and a charter from Pope Pius IX. The building is large and spacious, and the university, which is held in high esteem, is well equipped with apparatus, a library of over 85,000 volumes, a museum, geological specimens, and a picture gallery. Laval has a strong staff of professors, lay and clerical, and the faculties are theology, law, medicine, and arts. In connexion with this institution are the grand seminary founded in 1663, where theology is taught, and the minor seminary for literature and philosophy. Laval Normal and Model School, the Ursuline Convent,—a very large establishment for the education of young ladies, founded in 1641,—the Convent of the Good Shepherd, and several nunneries complete the list of

Masonic Hall. Laval University, which derives its name from the first bishop of Quebec, who founded in 1663 the seminary for the training of priests, is the principal educational establishment of the Roman Catholics. It was instituted in 1852 by a royal charter from Queen Victoria and a charter from Pope Pius IX. The building is large and spacious, and the university, which is held in high esteem, is well equipped with apparatus, a library of over 85,000 volumes, a museum, geological specimens, and a picture gallery. Laval has a strong staff of professors, lay and clerical, and the faculties are theology, law, medicine, and arts. In connexion with this institution are the grand seminary founded in 1663, where theology is taught, and the minor seminary for literature and philosophy. Laval Normal and Model School, the Ursuline Convent,—a very large establishment for the education of young ladies, founded in 1641,—the Convent of the Good Shepherd, and several nunneries complete the list of

Roman Catholic educational institutions. Morrin College (Presbyterian) was founded by Dr Morrin, and is affiliated with McGill University. Other Protestant schools are the boys' high school, the girls' high school, a number of academies, and public and private schools, all in a state of efficiency. In 1881 the number of children attending the various schools in Quebec was 9889, of whom half were girls. There is no free public library in the city, but the Literary and Historical Society,—the oldest chartered institution of the kind in Canada, founded by Lord Dalhousie in 1824,—the Canadian Institute, the Geographical Society, the Young Men's Christian Association, the Advocates' Library, and the Parliamentary Library have valuable collections of books. The principal benevolent institutions are the marine hospital, the Hôtel Dieu, founded in 1639 by the duchess of Aiguillon, the general hospital (1693), the Finlay Asylum, the Jeffrey Hale Hospital, the Church of England Female Orphans' Asylum, the Ladies' Protestant Home, St Bridget's Asylum, Grey Nunnery, and the lunatic asylum at Beauport. Nine daily newspapers are published at Quebec, six of which are in the French language. A good supply of water is afforded from Lake St Charles, but the city has suffered so severely from devastating fires in the past that in 1883 the common council ordered an additional pipe to be laid at a cost of half a million of dollars. Quebec is well lighted with gas and the electric light. Connexion is had with all parts of Canada and the United States by several railway lines, and the city is at the head of ocean steamship navigation to Europe. There are two lines of street cars. The head offices of three banks are situated in Quebec, viz., the Quebec Bank, the Union Bank of Lower Canada, and La Banque Nationale. Besides these there are two savings banks, the Post Office Savings Bank, and the agencies of the Bank of Montreal, the Bank of British North America, and the Merchants' Bank. The population of the city in 1871 was 59,699; in 1881, 62,446 (28,923 males and 33,523 females),—6200 being Protestants.

Shipbuilding was formerly one of the chief industries of Quebec, but of late years very few wooden ships have been built. In 1883 the number was twenty-five, representing a total tonnage of 4596 tons. Manufacturing is carried on to some extent, the principal manufactures being iron castings, machinery, cutlery, nails, leather, musical instruments, boots and shoes, paper, india-rubber goods, ropes, tobacco, steel, &c.

Quebec's staple export is timber, the greater portion of the shipments reaching town from the Ottawa and St Maurice districts. The rafts floating down the river are collected in the coves, and fastened by booms are moored along the banks. These coves extend along the river for upwards of 6 miles above the city. On the right bank of the stream, not far from Quebec, are extensive sawmills. The port is one of the leading emporiums of the export trade between Canada and Great Britain. The number, tonnage, and crews of the vessels entered and cleared at Quebec for several years is as follows:—

Year.	Entered.			Cleared.		
	No.	Tons.	Crews.	No.	Tons.	Crews.
1880	657	675,634	17,221	611	572,562	14,587
1881	783	802,186	19,888	851	847,615	20,225
1882	642	676,327	17,675	680	681,235	17,162
1883	682	737,059	18,687	653	631,213	15,652
1884	693	767,395	19,351	698	686,790	16,408

Large quantities of timber—especially white pine (10,427,000 feet in 1883), oak, and red pine—are exported from Quebec. The total value of exports in 1883 was \$9,268,983; of imports \$4,976,713, and of import duty received \$823,213·68. The value of the real estate is set down at \$24,000,000.

The city returns three members to the Canadian House of Commons, and three to the provincial House of Assembly. It is governed by a mayor, eight aldermen, and sixteen councillors, who hold their offices for two years. Quebec is the seat of the Roman Catholic archbishop, and the see of the bishop of the Church of England.

Quebec was first visited by the French navigator Jacques Cartier in 1535, when it consisted of a sparsely-settled Indian village called

Stadacona. In July 1608 the city was founded by Champlain, who bestowed on it its present name. Its growth was slow, and the numerous wars with the Indians and the English rendered the work of colonization and settlement precarious and difficult. In 1629 the English captured it, but three years later it was restored to the French. In 1663 the colony was created a royal government, and Quebec became the capital. In 1690 Sir William Phips with a numerous fleet attempted to reconquer it, but the French governor, Count de Frontenac, destroyed many of his vessels and forced the English to fly. The French held possession until 1759, when it fell into the hands of the British under Wolfe, and it was finally ceded to Britain by the treaty of Paris in 1763. In 1775 General Montgomery with an American force attacked the city, but he perished before its walls and his troops were dispersed. Since then its capture has not been again attempted. (G. ST.)

QUEDAH or KEDAH. See MALAY PENINSULA, vol. xv. p. 322.

QUEDLINBURG, an ancient town of Prussian Saxony, in the district of Magdeburg, is pleasantly situated on the Bode, near the north-west base of the Harz Mountains. It is still partly surrounded by a turreted wall. On the west it is commanded by the old chateau of the imperial abbesses of Quedlinburg, with the interesting abbey church, the body of which was erected in the 11th century. In the crypt, dating from the 10th century, are interred Henry the Fowler and his wife Matilda. The Late Gothic town-house, with additions of the 18th century, contains a good collection of local antiquities. The town also possesses several other churches and numerous schools and charitable foundations. Quedlinburg is famous for its nurseries and market-gardens, and exports vegetable and flower seeds to all parts of Europe and America. It supplies most of the seed used for the cultivation of beet-root for sugar in Silesia, Austria, and Poland. It also carries on manufactures of cloth, iron, and chemicals, and a trade in grain and cattle. The poet Klopstock was a native of Quedlinburg. The population in 1880 was 18,437, almost all Protestants.

The town of Quedlinburg, which was founded by Henry the Fowler about the year 930, on the site of the old village of Quitlingen, became a favourite residence of the Saxon emperors, and was the scene of several diets and assemblies of princes. It afterwards joined the Hanseatic League, and attained its greatest prosperity in the 13th or 14th century. The convent was established a few years after the town, and was also richly endowed with lands and privileges. The abbesses, who were frequently members of the imperial house, ranked among the independent princes of the German empire and had no ecclesiastical superior except the pope. The town at first strove zealously to maintain its independence against the abbess, and to this end called in the aid of the bishops of Halberstadt. In 1477, however, the abbess Hedwig, aided by her brothers Ernest and Albert of Saxony, forced the bishops to renounce their claims; and for the next two centuries both town and abbey remained under the protection of the electors of Saxony. In 1539 the Reformation was embraced, and the nunnery was converted into a Protestant sisterhood. In 1697 the elector of Saxony sold his rights over Quedlinburg to the elector of Brandenburg, whose troops forthwith entered the town. The abbesses retained their right of private jurisdiction, and the disputes between them and the Prussian Government were not finally settled till the secularization of the abbey in 1803. The last two abbesses were the Princess Anna Amelia (1755–1787), sister of Frederick the Great, and the Princess Sophia Albertina, daughter of King Adolphus Frederick of Sweden.

QUEEN ANNE'S BOUNTY is the name applied to a perpetual fund of first-fruits and tenths granted by a charter of Queen Anne, and confirmed by statute in 1703 (2 & 3 Anne, c. 11), for the augmentation of the livings of the poorer Anglican clergy. First-fruits (*annates*) and tenths (*decimæ*) formed originally part of the revenue paid by the clergy to the papal exchequer. The former consist of the first whole year's profit of all spiritual preferments, the latter of one-tenth of their annual profits after the first year. Benefices under the annual value of £50 are now exempt from the tax. The income derived from first-fruits and tenths was annexed to the revenue of the crown in 1535 (26 Hen. VIII. c. 3), and so continued

until 1703. Since that date there has been a large mass of legislation dealing with Queen Anne's Bounty, the effect of which it is impossible to deal with fully in this place. The governors consist of the archbishops and bishops, some of the principal officers of the Government, and the chief legal and judicial authorities. The augmentation proceeds on the principle of assisting the smallest benefices first. All the cures not exceeding £10 per annum must have received £200 before the governors can proceed to assist those not exceeding £20 per annum. In order to encourage benefactions, the governors may give £200 to cures not exceeding £45 a year, where any person will give the same or a greater sum. The average income from first-fruits and tenths is a little more than £14,000 a year. In 1883 the trust funds in the hands of the governors amounted to £4,306,717. The grants in 1883 amounted to £15,400, the benefactions to £20,195. The accounts are laid annually before the queen in council and the Houses of Parliament. The duties of the governors are not confined to the augmentation of benefices. They may in addition lend money for the repair and rebuilding of residences and for the execution of works required by the Ecclesiastical Dilapidations Acts, and may receive and apply compensation money in respect of the enfranchisement of copyholds on any benefice. The governors are unpaid; the treasurer and secretary receives a salary of £1000 a year. He is appointed by patent under the great seal, and holds office during the pleasure of the crown.

QUEEN CHARLOTTE ISLANDS, a group of islands lying off the west coast of British Columbia, to which they belong. They were so called by Captain Dixon, who visited them in the "Queen Charlotte" in 1787, and spent more than a month on their coasts. They are composed of two chief islands, Graham Island to the north and Moresby Island to the south, separated by a very narrow channel; but around these, especially in the south, are innumerable smaller islands. The whole group has the form of a wedge with the point towards the south. The extreme length is about 180 miles, and the greatest breadth 60 miles. The total area cannot be determined, as the longitude of the west coast has not yet been definitely ascertained. See vol. iv. Pl. XXXV.

The islands are mountainous, and appear to be a partially submerged continuation of the mountain chain traversing Vancouver's Island, which lies to the south, separated from the group by Queen Charlotte Sound. The mountains are situated more particularly in the southern island, which is little more than a skeleton of mountains washed at their base by the waters of numerous inlets. Many summits here rise above 5000 feet in height. The larger island to the north, which has a length of about 77 miles and a breadth equal to the maximum breadth of the group, is in general lower, though here also there are hills rising to between 2000 and 3000 feet. Both the mountains and lowlands are well wooded, but in general the timber is not found in accessible spots in sufficient quantity to encourage attempts to develop the lumber trade. At present the principal commercial resources of the islands are derived from the fish that frequent these shores. Immense shoals of dog-fish visit the north and north-east, and they are utilized for their oil by a company established on Skidegate Inlet on the east side of Moresby Island. Holibut, herring, salmon, cod, and coal-fish or "skil" (this last also rich in oil and a valuable food-fish) are likewise abundant. The climate is extremely moist, especially on the west side of the watershed.

Geologically the group appears to be composed mainly of Triassic, Cretaceous, and Tertiary strata, with intrusive masses here and there of granite and other igneous rocks. The Triassic deposits occupy almost the whole of the

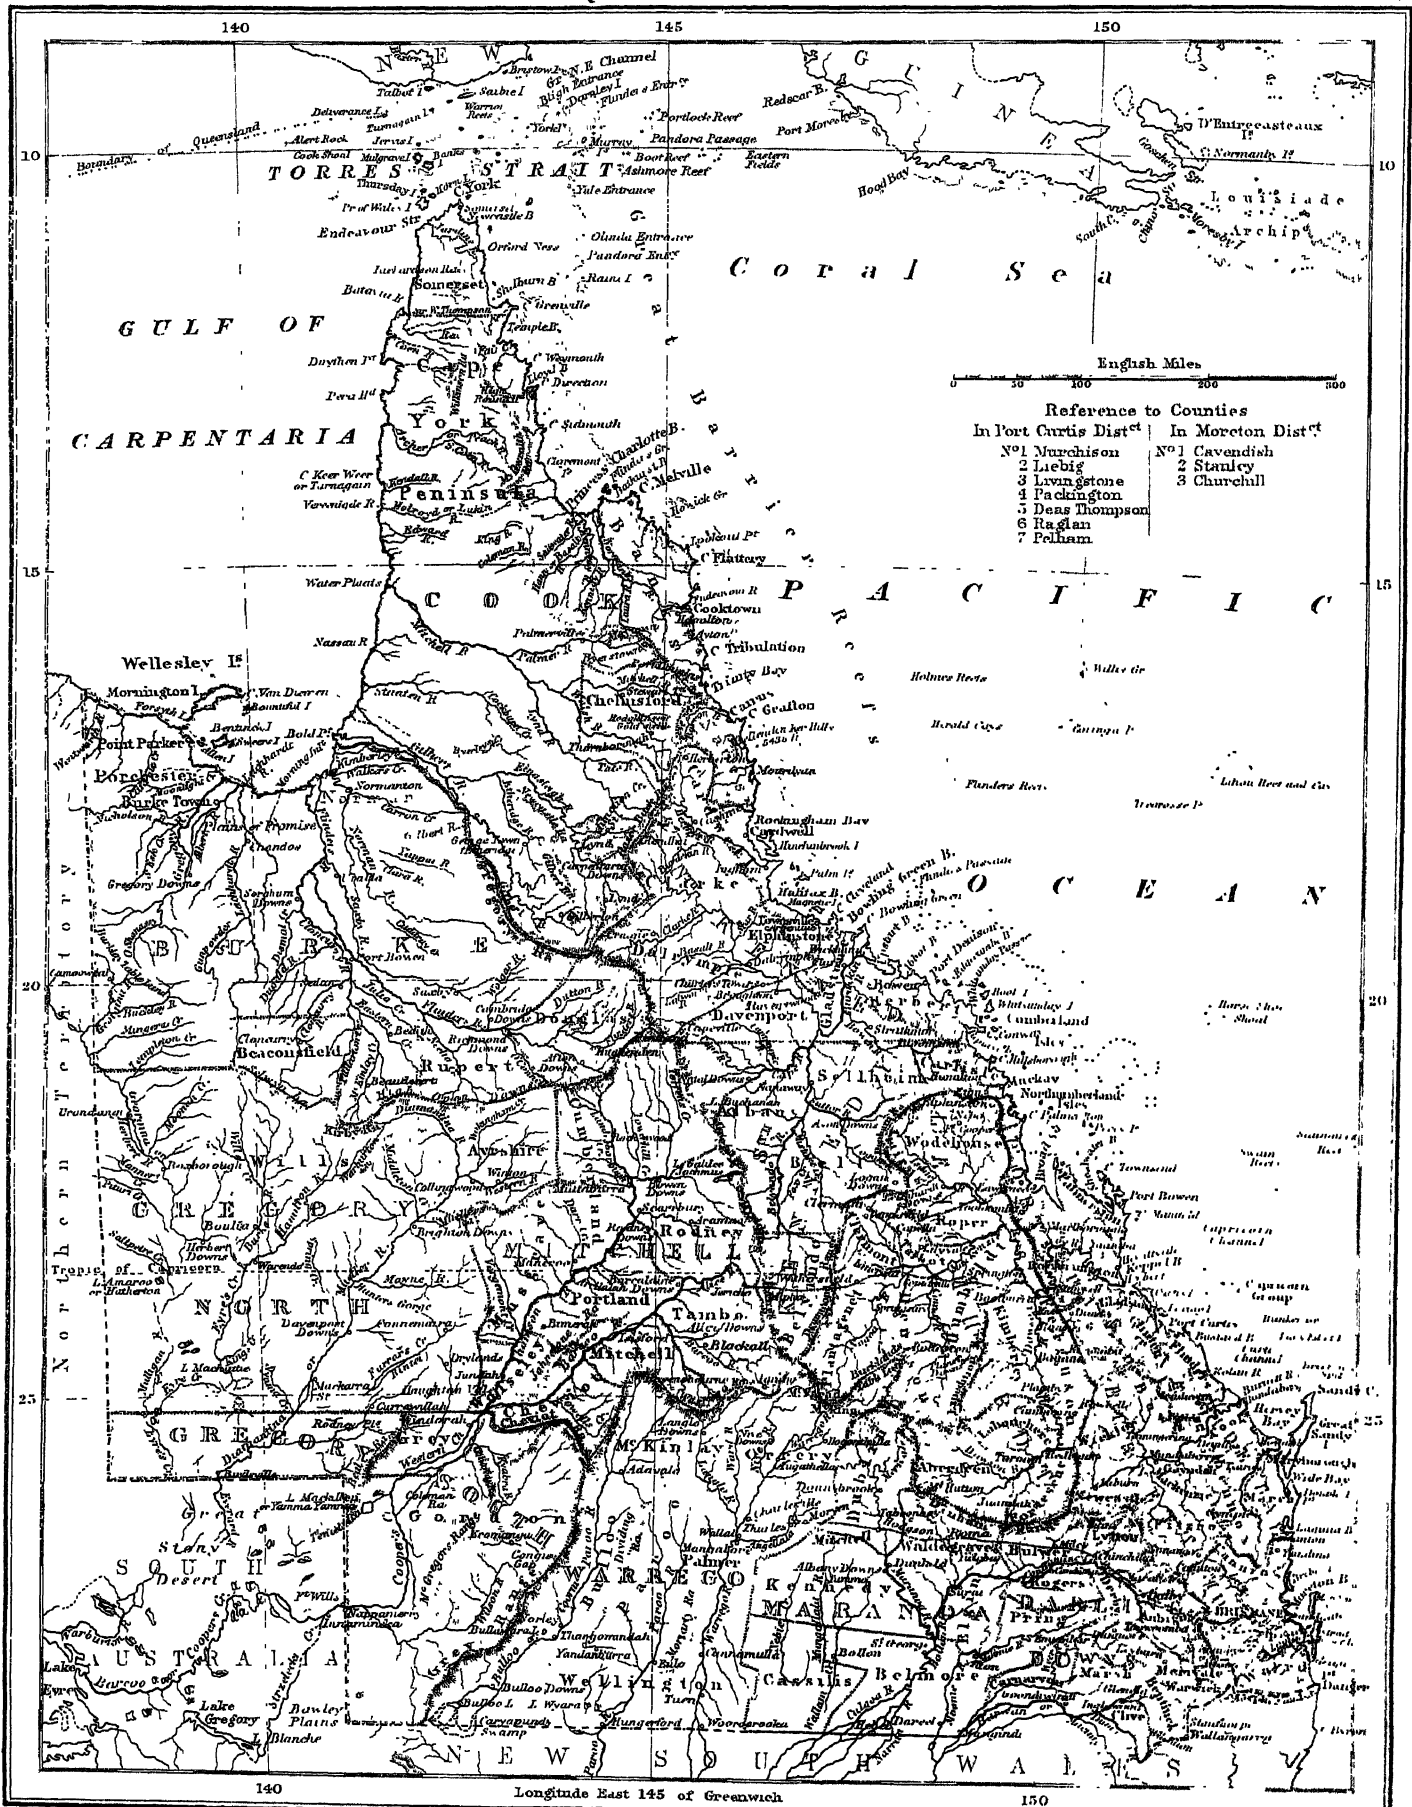

southern part of the group, and it is uncertain whether some Palæozoic rocks may not be exposed at certain points, as they are in corresponding situations on the mainland of British Columbia. The Cretaceous deposits lie unconformably on those of Triassic age on both sides of Skidegate Inlet and Channel (in the south of Graham Island and north-east of Moresby Island), and are interesting geologically from containing a bed of anthracitic coal. These deposits are again unconformably overlaid by those of Tertiary age extending over the greater part of Graham Island; and the unconformity in this case is accompanied by evidence of great disturbance, indicating that this was the chief period of mountain-making in the group.

The islands are inhabited by an interesting race of Indians called the Haidas, who are chiefly found on the coasts, where they support themselves by fishing, partly also by the cultivation of the potato, which was probably introduced among them by some of the early voyagers. They tattoo their bodies, sometimes paint their faces, and have many singular customs; but their greatest peculiarity consists in their habit of erecting great numbers of carved posts as ornaments in front of their dwellings. Their number is rapidly decreasing, and in the last official report on the exploration of this group (Victoria, 1884), it is estimated at only eight hundred.

The fullest account of the Queen Charlotte Islands and their inhabitants is to be found in the report of George M. Dawson in the *Report of Progress for 1878-79* of the Geological Survey of Canada.

QUEENSBERRY, JAMES DOUGLAS, SECOND DUKE OF (1662-1711), was the eldest son of William, third earl and first duke, high treasurer of Scotland, and Isabel Douglas, sixth daughter of William, first marquis of Douglas. He was born at Sanquhar Castle 18th December 1662, and educated at the university of Glasgow, after which he spent some time in foreign travel. He sided with the prince of Orange at the Revolution, and was appointed a privy councillor, and colonel of the Scotch troop of horse guards. On the death of his father in 1695 he succeeded him as extraordinary lord of session, and was also appointed keeper of the privy seal. In 1702 and 1703 he was appointed by Queen Anne secretary of state, and commissioner to the parliament of Scotland. In the latter year he was deprived of his offices, but he was again restored in 1705, and in the following year was constituted high commissioner on the part of Scotland for carrying out the Treaty of Union between the two kingdoms, which, chiefly owing to his influence and skill, was completed in 1707. In recognition of his services he received a pension of £3000 per annum, and on the 26th May 1708 was created a British peer by the title of duke of Dover. On 9th February 1709 he was appointed third secretary of state. He died 6th July 1711.

QUEEN'S COUNTY, an inland county in the province of Leinster, Ireland, is bounded N.W. and N. by King's County, E. by Kildare and a detached portion of King's County, S. by Carlow and Kilkenny, and W. by Tipperary. Its greatest length from east to west is about 35 miles, and its greatest breadth from north to south about 30 miles. The area is 424,854 acres, or about 663 square miles. The surface is for the most part level or gently undulating, but in the north-west rises into the elevations of the Slieve Bloom Mountains, the highest summit being Ardern, 1733 feet. Like the level country, they belong to the limestone formation, but are wrapped round with folds of Old Red Sandstone. In the central part of the county there is a large extent of bog. The south-east portion is included in the Leinster coal-field. Iron ore, copper, and manganese are found in small quantities. Potter's clay is plentiful; and slate, sandstone, and marble are quarried in some places. Nearly the whole of the

county is drained either by the Barrow, which has its source in the Slieve Bloom Mountains, and forms at various points the boundary with King's County, Kildare, and Carlow, or by the Nore, which enters the county from Tipperary near Borris-in-Ossory, and flows east and then south till it reaches Kilkenny. The lakes are few and small, the largest being Lough Anaghmore on the north-western boundary. The Grand Canal enters the county at Portarlinton, and runs southwards to the Barrow in Kildare, a branch passing westwards 12 miles to Mountmellick.

Agriculture.—The climate is dry and salubrious. Originally a great extent of the surface was occupied with bog, but by draining much of it has been converted into good land. For the most part it is very fertile except in the hilly districts towards the north, and there is some remarkably rich land in the south-east. The total extent under crops in 1884 was 129,617 acres, of which 73,536 acres were under tillage and 56,081 acres under meadow and clover. Of the 42,755 acres under corn crops 639 acres were under wheat, 24,467 acres under oats and 17,689 acres under barley. Of the 30,601 acres under green crops, 15,888 were under potatoes, and 12,077 under turnips. Dairy farming is extensively carried on. The total number of cattle in 1883 was 78,496, of which 20,421 were milch cows. There were 70,530 sheep, 33,834 pigs, 5433 goats, and 249,619 poultry. Horses and mules numbered 14,494, and asses 5742.

Agriculture forms the chief occupation, but the manufacture of woollen and cotton goods is carried on to a small extent.

Railways.—The Great Southern and Western Railway crosses the country from north-east to south-west with stations at Portarlinton, Maryborough, Mountrath, and Ballybrophy. At Portarlinton a branch passes westward to Mountmellick; there is also a branch passing southward from Maryborough, and another passing westward from Ballybrophy.

Administration.—The county is divided into eleven baronies, and contains 53 parishes and 1156 townlands. Ecclesiastically it is in the dioceses of Leighlin and Ossory, with portions in those of Kildare, Killaloe, and Dublin. Judicially it is in the home circuit. Assizes are held at Maryborough, the county town, and quarter sessions at Abbeyleix, Borris-in-Ossory, Carlow-Graigue, Maryborough, Mountmellick, and Stradbally. There are fifteen petty sessions districts. The poor-law unions of Abbeyleix and Donaghmore are wholly within the county, and portions of those of Athy, Carlow, Mountmellick, and Roscrea. The county is included in the Dublin military district, and there is a barrack station at Maryborough.

Population.—Within the last forty years the population has diminished by more than one-half. In 1841 it numbered 153,930, which in 1871 had diminished to 79,765, and in 1881 to 73,121. The following were the largest towns:—Mountmellick (3126), Maryborough (2872), Portarlinton (partly in King's County) (2357), and Mountrath (1865).

History.—Anciently the territory now included in Queen's County was divided between the districts of Leix, Offaly, Clannaliere, and Ossory. In the reign of Philip and Mary, it was made shire ground under the name of Queen's County, in honour of the sovereign, the place chosen for the county town being named Maryborough. Three miles south of Stradbally is Dun of Clopook, an ancient dun or fort occupying the whole extent of the hill, and there is another large fort at Lugacurren. Aghaboe, where there are the ruins of the abbey, was formerly the seat of the bishopric of Ossory. There are no remains of the Abbey of Timahoe founded by St Mochua in the 6th century, but in the neighbourhood of the site there is a fine round tower. Among the principal old castles are the fortress of the O'Moores in ruins occupying the precipitous rock of Dinamase, three miles east of Maryborough, Borris-in-Ossory on the Nore, and Lea castle on the Barrow, 2 miles below Portarlinton, erected by the Fitzgeralds in 1260, burnt by Edward Bruce in 1315, again rebuilt, and in 1650 laid in ruins by the soldiers of Cromwell.

Plate III.

QUEENSLAND, a British colony, the north-eastern portion of Australia, is situated between New South Wales and Torres Strait, and between the Pacific Ocean and the Northern Territory of South Australia. Its southern boundary is about 29° S. lat.; its western is 141° E. long. from 29° to 26° S. lat., and 138° E. thence to the Gulf of Carpentaria; its northern is about 9° S. including the Torres Straits islands. In extreme length it is 1400 miles; in breadth, 1000. Its area is 669,520 square miles, or about 5½ times that of the United Kingdom. The population is under 300,000.

With a seaboard of over 2500 miles, it is well favoured with ports on the Pacific side. Moreton Bay receives the Brisbane river, on whose banks Brisbane, the capital, stands. Maryborough port is on the Mary, which flows into Wide Bay; Bundaberg, on the Burnett; Gladstone, on Port Curtis; Rockhampton, up the Fitzroy (Keppel Bay); Mackay, on the Pioneer; Bowen, on Port Denison; Townsville, on Cleveland Bay. Cairns and Port Douglas are near Trinity Bay; Cardwell is on Rockingham Bay; Cooktown, on the Endeavour; Thursday Island port, near Cape York; and Normanton, near the Gulf of Carpentaria. The new gulf port is at Point Parker. The quiet Inner Passage, between the shore and the Great Barrier Reef, 1200 miles long, favours the north-eastern Queensland ports. Ipswich, Toowoomba, Oxley, Beenleigh, Maryborough, and Mackay are farming centres; Warwick, Roma, Clermont, Blackall, Aramac, Hughenden, and Mitchell are pastoral ones. Gympie, Charters Towers, Ravenswood, and Palmerville are gold-mining towns; while Stanthorpe and Herberton have tin mines. Townships are laid out by Government as occasion requires. There are fifteen large districts, viz., Moreton, Darling Downs, Wide Bay, Burnett, Maranoa, Warrego, and South Gregory, southward; Port Curtis, Leichhardt, South Kennedy, Mitchell, and North Gregory, central; North Kennedy, Burke, and Cook, northward. Cape York Peninsula is the northern limit. A few persons were sent to the Brisbane in 1826; but the Moreton Bay district of New South Wales was thrown open to colonization in 1842. It was named "Queensland" on its separation from the mother colony in 1859. A natural but unfounded prejudice against its supposed warmer position retarded its progress, or confined its few inhabitants to pastoral pursuits. The discovery of abundant wealth in minerals and sugar-lands, with the growing conviction of its singular salubrity, greatly advanced the immigration prospects of the colony. A broad plateau, of from 2000 to 5000 feet in height, extends from north to south, at from 20 to 100 miles from the coast, forming the Main Range. This region is the seat of mining, and will be of agriculture. The Coast Range is less elevated. A plateau goes westward from the Great Dividing Range, throwing most of its waters northward to the gulf. The Main Range sends numerous but short streams to the Pacific, and a few long ones south-westward, lost in earth or shallow lakes, unless feeding the river Darling. Going northward, the leading rivers, in order, are the Logan, Brisbane, Mary, Burnett, Fitzroy, Burdekin, Herbert, Johnstone, and Endeavour. The Fitzroy receives the Mackenzie and Dawson; the Burdekin is supplied by the Cape, Belyando, and Suttor. The chief gulf streams are the Mitchell, Flinders, Leichhardt, and Albert. The great dry western plains have the Barcoo, Diamantina, Georgina, Warrego, Maranoa, and Condamine. There are few lakes. A succession of elevated and nearly treeless downs of remarkable fertility contrasts with the heavily timbered country favoured by the rains. Cape York Peninsula is an epitome of Queensland. There is good land alternating with bad. The hills are rich in gold, silver, copper, tin, and coal. The forests are valuable, and the scrub is dense. Flats near the mouths of the many streams are admirable for sugar-cane and rice, while rising slopes suit coffee trees. West of the range dividing the gulf waters from the Pacific is a sandy grassless region where the only vegetation is a poisonous pea. Suddenly the traveller passes from this desert to the glorious downs around Hughenden, a garden-land beside the Flinders. Farther north-west is the charming Leichhardt river district, and the marvellous mineral Cloncurry highland. Southward of that again is the country of the Diamantina and

Georgina, with little rain, but having vast tracts of good black soil threaded by slight ridges of barren sandstone. Droughts are there followed by floods from thunder showers. The south-western portion is inferior to all, having heavy sand-rises between the grassy belts. Still the pastoral settlers are taking up areas there. All that dry warm west is remarkably healthy for man and beast. The productive and better-watered part between the Main Range and the Pacific has the principal population.

Climate.—The coast-lands, with an annual rainfall of from 40 to 130 inches, are favoured by the south-east trade-winds and the summer north-west monsoons. During 1882 there fell at Johnstone river, 17° S., nearly 160 inches on one hundred and ninety-seven days. Northern Queensland, up to the ranges, is well watered. Central and southern districts are not so aided by the monsoons. The highlands have on their eastern side from 30 to 70 inches, but on their western only from 15 to 30. The gulf region has from 30 to 60. The southern hills have far less rain than the northern ones. The arid western area depends on occasional thunderstorms, though nature provides a grass that long resists the drought. The low south-west basin, trending to the depressed lake region of South Australia, has repeatedly seasons of intense dryness. In temperature, Brisbane has a mean of 69°—between 34° and 105°. The hilly districts, even in the tropics, have slight frosts in winter, but a high barometer in the dry warm weather. North Queensland has less heat than its latitude would seem to threaten. Tropical ports show a lower summer thermometer than may sometimes be seen in Sydney, Adelaide, and Melbourne. The western heat is stimulating in its dryness and electrical condition. The oppression on the northern coast is felt during the rainy season, though the showers cool the air. The prevalence of south-east winds off the sea mitigates the trials of summer. The dreaded "hot wind," brought southward by the usual course from central Australian deserts, descends upon the southern colonies, avoiding Queensland. Still the ordinary western breeze, passing over so great an expanse of land, while positively cold on winter nights, is sufficiently hot during the summer.

In a recent year the colonial registrar-general gave the death-rate of Brisbane municipality at 13 in the thousand, Toowoomba 17, and Rockhampton 15. In the tropics it was 12 at Charters Towers and Cooktown, 15 at Townsville; but 29 at Mackay, where the sickly Polynesians abound. The prevalent diseases are rather from disordered liver and bowels than lungs and throat. Low fevers, seldom fatal, continue for a time in all newly opened-up country throughout Australia, as in America. Female mortality, even in the tropical ports, is considerably less than that of males. Infants, as a rule, thrive better in the colony, according to numbers, than in England. Cooktown, in lat. 16° S., is regarded by some as the sanatorium of the future. Queensland can give invalids any climate they may desire—moist and equable, dry and exhilarating, warm days and cool nights, soft coast airs for bronchial affections, and more bracing ones for other consumptives.

Geology.—Queensland is geologically connected with New South Wales and Victoria by the great chain of hills continued through the eastern portion of Australia, from Cape York to Bass's Strait. That immense range consists largely of Palæozoic formations with igneous rocks. The granites, porphyries, and basalts have greatly tilted and metamorphosed the sedimentary deposits of Silurian, Devonian, Carboniferous, and Oolitic ages. The width of this elevated and mineral part of the colony varies from 50 to 400 miles. Ancient formations, however, rise in the broad western plains, and everywhere indicate metallic

treasures. Nearer the eastern coast granite and porphyritic rocks appear in greater force than in the Dividing Range, and the voyager rarely loses sight of them all the way from Moreton Bay to Cape York. They add much to the attractiveness of the scenery, especially in Whitsunday Passage. The old sedimentary strata consist of sandstones, limestones, conglomerates, and slates of various kinds. The Carboniferous beds are of great extent, occupying thousands of square miles (perhaps as many as 100,000), on the highlands, and on both sides of the Main Chain. It is in north and central Queensland that the mineral is found of the true Palæozoic character, bearing the distinctive floral features of the English and New South Wales Newcastle formation. The Jurassic and Liassic rocks of the southern hilly districts are rich in cannel coal. The Wollumbilla beds are similar to the Upper Wiannamatta ones of New South Wales. The Mesozoic or Secondary formations prevail largely to the westward. Ammonites, belemnites, and ichthyosauri declare the same condition of things as once existed in the English midlands. The Cretaceous and Oolitic series on the western plains occupy nearly a third of Queensland, and their grassy surface is being rapidly covered with flocks of sheep. A descent below the ocean level produced the Tertiary beds. The so-called "desert sandstone" may have once covered nearly the whole of the colony, though suffering great denudation afterwards, to the decided satisfaction of settlers. It still stretches over much of the extensive plateau and both slopes. In some places it is hundreds of feet thick. The favourite Downs have got free from this arid incubus. Tertiary freshwater beds, not marine ones, are seen towards the coast. The volcanic element is very distinguishable, and is a source of the large area of fertile soil. Throughout the ranges, and over many of the downs, basalts and lavas abound. Though no eruptive cone appears, there are hundreds of well-defined extinct craters, some being 4000 feet above sea-level, surrounded by sheets of lava and masses of volcanic ashes. The Great Barrier Reef, following the line of the north-east coast for 1200 miles, preserves the memory of an ancient shore; the coral animalculæ built on the gradually sinking cliffs. The reefs approach the coast-line within five miles northward and one hundred southward, having an area of 30,000 square miles, and protecting eastern Queensland from the violence of Pacific storms. A narrow deep trough in the sea-bottom extends from Moreton Bay to Fiji. Within 100 miles of Cape Moreton the water is 16,000 feet in depth. While the alluvial gold and tin-workings are among the Tertiary and post-Tertiary formations, the veins and lodes of gold, silver, copper, tin, and other metals are in the solid granite, or in the ancient sedimentary rocks, particularly in association with dioritic and other igneous intrusions. Greenstone has there some of the richest of copper lodes. The celebrated tin mines of Tinaroo are in granite mountains 3000 feet high, where Englishmen work without discomfort within the tropics. Some of the tropical coal-fields are also at a considerable elevation, though nowhere are they situated in an insalubrious locality. The more southern coal seams are in districts as healthful as they are beautiful. The Queensland fossils greatly resemble those of other parts of the world. Those, however, of the more recent Tertiary times indicate the presence of animals akin to existing marsupials, though some of the kangaroo order stood a dozen feet in height, and had the bulk of a hippopotamus. The diprotodon, 16 feet in length, may have pulled down branches or young trees for its support. The rise of land would have diminished water-supply in the interior, and caused the gradual disappearance of the gigantic marsu-

pials. A monster bird, like the New Zealand moa, twice as large as the existing emu, once strode over Queensland plains. An ichthyosaurus, computed nearly thirty feet in length, was found on the surface of the Flinders river downs. The Secondary fossils have less resemblance than those of Western Australia to the European species. Near the Condamine a fossil monitor twenty feet long was unearthed. The northern coal-fields display the *Glossopteris*, *Sigillaria*, and *Lepidodendron*. The northern beds exhibit the mesozoic *Thinnfeldia odontopterodes*, *Alethopteris australis*, and *Podozomites distans*. Some existing Queensland fish, as the ceratodus, are allied to those of the Carboniferous age in Great Britain.

Minerals.—Gold is found in alluvial deposits and in quartz veins. The most important of the former were near the northern Palmer river, but auriferous quartz now almost monopolizes the digger's attention. The recognized gold workings are over 7000 square miles. While there were 3454 Europeans, early in 1883, engaged in quartz mining, only 280 were on alluvial ground; in the same year 2046 Chinese worked alluvial claims. Charters Towers in the north and Gympie in the south are the chief gold centres; but Mount Morgan, south of Rockhampton, is the richest mine yet discovered. The gold export realized £1,498,433 in 1875, but only £829,655 in 1882. The decrease is owing to the greater dependence of the miners on blasting rock.¹

Gold is often found mixed with silver, copper, or lead. One lode had to the ton 75 to 120 ounces of silver and from $\frac{1}{2}$ oz. to $\frac{1}{4}$ oz. of gold. Silver ore is being worked to great advantage now near Ravenswood, Star river, and Sellheim river. Copper has been long so low-priced in England that its extraction in the colony, with high-rated labour, has been seriously checked. The cupriferous area is very large there. Mount Perry, Peak Downs, Herberton, and Cloncurry are the leading copper sites. The "Australian" mine of Cloncurry, 200 miles south of the gulf, is very rich. In one place a lode, 80 to 120 feet wide, showed 30 per cent. of bismuth and 40 of copper to the ton. Tin streams were first opened at Stanthorpe, near the southern border. Tin lodes of astonishing richness exist in the Wild river district about 19° S. lat. There are single claims of tin stream, or on tin lodes, besides tin land leases, at Tate river, Wild river, and other localities. The Tinaroo yield in the five years has been £383,350. Called the Cornwall of Australia, this tin district shows gold, silver, copper, and antimony. The tin export of the colony during 1883 was £298,845. Iron ores abound, but with no present prospect of being utilized. Bismuth, graphite, antimony, nickel, cinnabar, and other metals are known. Precious stones are gathered from gold and tin workings. Building stones are plentiful in variety, and good in quality. Granite, porphyry, basalt, sandstone, and marbles are wrought. The coal is, after all, the most important and useful of the minerals. Already steamers, foundries, and railways are being supplied from Queensland pits. Several beds are known near Moreton Bay. About Ipswich and Darling Downs the coal is clean to the touch. Some specimens cake, others do not. All are good for gas and steam purposes. The Darling Downs beds are in an ancient lake, and are valuable for fuel and oil. On 100 lb of that coal being burnt, 529 lb of water were evaporated to 505 from Newcastle coal, leaving 16 lb of ash to 7 for the other. That canal is of Lias age. Much rests under the Eolian sandstone and basalt of the west. The Burrum mineral, between Maryborough and Bundaberg, is true coal, yielding, at the first opening, 3000 tons a month. One seam would give 5,000,000 tons. The Dawson, Bowen, and Mackenzie river basins, of vast extent, are Palæozoic, as in the Drummond range, and westward over the main chain. Coal is found in the York peninsula. On the coal of Queensland the distinguished Australian geologist, the Rev. J. Tenison Woods, expresses himself thus:—"The fact that the coal formations cover so vast an extent of the territory, and so many valuable coal-fields having been discovered, makes me confident in predicting that its resources in coal are enormous, are equal, if not superior, to any other colony, and will raise her shores to be in the end the grand coal emporium of the southern hemisphere."

Agriculture.—Until the last few years little cultivation was to be seen, and only 180,000 acres yet receive such attention. Labour was supposed to pay better in other employments. Still there can be grown in Queensland corn of all varieties, hay, English vege-

tables, sweet potatoes, melons, cassava, cocoa, indigo, arrowroot, ginger, coffee, rice, tobacco, cotton, spices, cinchona, cocoa-nut, bread-fruit, and sugar-cane, with the fruits of England, India, and China. Lucerne is much grown for stud stock, where winter food is needed. Bananas, oranges, grapes, pine-apples, mangoes, guavas, tamarinds, and dates thrive well. Coffee is being extensively produced. Many Ceylon planters have recently settled in the colony. Cotton pods, tended mostly in Moreton district, are now a paying crop. The mulberry success is paving the way for silk culture. The Roma grapes and oranges are much esteemed. Bananas grow on any coast-lands. Arrowroot and tobacco are profitable. Sweet potatoes are extensively used. Rice will be a crop of the future. Farmers in the southern hills raise corn and English fruits. Dairy farming belongs more to a cooler latitude. Wheat can be successfully produced, when labour is cheaper, over an area of 60,000 square miles. Stanthorpe wheat gave 67 lb to the bushel. Maize is a more certain crop. But sugar-cane is now the Queensland farmer's chief resource. From the southern border up to Cape York, if near the coast, it can be raised. All round Moreton Bay, and in the Maryborough and Bundaberg neighbourhood, it does well; but in the more northern parts, as at the Mackay, Cairns, Burdekin, Johnstone, and Herbert fields, the yield is greater, and the plant comes earlier to maturity. In the Mackay sugar district, during 1884, there were 22,000 acres in cane. Coast Queensland has not only warmth, and rich alluvial or scrub soil, but abundance of rain when growth requires it, with fine weather at cane ripening for manufacturing sugar. Some planters have their own appliances for the extraction of juice and the manufacture of sugar, but the small farmers combine to have machinery in their district, or else dispose of cane or juice for cash to the neighbouring sugar-maker. Polynesians or Kanakas have been used for the sugar-house, though Europeans do all the work of growth and manufacture in South Queensland. Chinese merchants are establishing cane grounds, worked by their own countrymen; and Germans and Scandinavians have extensively embarked in this industry.

Pastoral farming is still the leading industry of the colony, and is rapidly extending over all districts. An occasional check to its prosperity comes by drought in the dry western interior. But a few good seasons, in that healthy wilderness, enable the sheepmaster to recoup himself,—especially as, in the remoter parts, he has a securer tenure and a very small rental. In "settled districts," and within 30 miles of the coast, a "run" is subject to resumption by the state, at six months' notice, should any part be required to be cut up for farms. In the more distant "unsettled district" a lease of twenty-one years is fairly secure. The rent advances every seven years of the term from about half a farthing to a penny an acre. In the dry parts, where grass is insufficient, cattle and sheep thrive well on the salt bush and other shrubs. The only really unavailable pastoral region is that portion of the north-western slope of the Main Range already referred to. The spear-grass sometimes sends its barbed tufts into the flesh of sheep. Wild dogs, floods, and droughts have to be encountered, though the animals to be tended are unaffected by ailments plaguing flocks and herds in Britain. The western plains, dry but fertile, are best for sheep; the hills and moist coast-lands for cattle and horses. The merino sheep yields excellent wool on tropical pastures, contrary to former expectations. The sheep had increased from 3,000,000 to 12,000,000 between 1860 and 1883; and cattle, from 430,000 to 4,320,000. To meet future droughts, subterranean streams have been found by artesian wells. In the most arid wastes, and the storage of water after floods will furnish a supply in dry weather.

Flora.—The Queensland flora comprehends most of the forms peculiar to Australia, with the addition of about five hundred species belonging to the Indian and Malayan regions. The eastern portion of New Holland may have a vegetation of a somewhat different type from that of the western, but both have older representatives than those found in the central zone from the gulf to the Southern Ocean. The trees in the north-east of Queensland include the *Cycas* and the screw or *Pandanus*. The pines take an important position in the colony,—as the Moreton Bay pine (*Aracaria Cunninghamii*), the Burnett bunya bunya (*Aracaria Bidwellii*), the kauri or dundathu (*Dammara robusta*), and the she pine (*Podocarpus elata*). The *Callitris* or cypress family like poor soil. The cedar forests are buried in scrub towards the mouths of eastern rivers. Coast-lands are crowded with trees, though brigalow-scrub, with the silver-leaved tops, prevails far inland. There are trees rising above 300 feet. One monster, near the Johnstone river, was seen 88 feet in girth at 55 feet from the ground, and 150 at the base. The Moreton Bay fig-tree has immense wall-like abutments. The bottle or gouty stem tree of the north, *Delabechia Gregori*, is allied to the African baobab. Flowers are numerous, yielding often a powerful fragrance, though most commonly exhibited on shrubs. Queensland is notably a timber region, having both hard and soft woods. Above three hundred useful woods, many taking a fine polish, were sent to a recent exhibition. An active export of some, particularly cedar and pine, is conducted at Maryborough and Port Curtis. Woods there are in use for building purposes,

¹ As an illustration of success the Day Dawn mine of Charters Towers may be cited. Some Germans long struggled in vain, and with difficulty got enough gold to supply them with food. Suddenly they struck a rich reef. After considerable gains they formed a company to work the ground. Upon a paid-up capital of £12,000, the shareholders' dividends in four years came to £138,399. Gympie affords even more remarkable instances of good fortune.

furniture, dyeing, shipbuilding, coachbuilding, hoops and staves, turnery, gunstocks, veneering, &c. Among the *Eucalypti* are those known as Moreton Bay ash, mahogany, yellow box, blackbutt, ironbark, turpentine, bloodwood, messmate, with the blue, red, grey, forest, swamp, scented, and spotted gum trees. The ironwood, brigalow, and myall are of the *Acacia* genera. Among the *Casuarinæ* are the he, she, swamp, forest, and river oaks. Names are found oddly given by colonists. Their red cedar is the *Cedrela Goona*; white cedar, the *Melia composita*; pencil cedar, the *Dysoxylon Muelleri*; white wood, the *Alstonia*; light yellow wood, the *Flindersia orleyana*; dark yellow wood, the *Rhus*; beech, the *Gmelina Leichhardtii*; coachwood, the *Ceratopetalum*; ebony, the *Malba*; musk, the *Marlea*; Leichhardt's tree, the *Sarcocephalus cordatus*; mahogany, the *Tristania*; tulip, the *Stenocarpus sinuatus*; honeysuckle, the *Banksia*; pea-tree, the *Melaleuca*; bottlebrush, the *Callistemon lanceolatus*; beefwood, the *Banksia*; satinwood, the *Xanthoxylum brachyacanthum*; coral tree, the *Erythrina*; apple, the *Angophora subvelutina*; teak, the *Dissiliaria baloghioides*; feverbark, the *Alstonia constricta*; sandalwood, the *Bremophila Mitchellii*; lignum vita, the *Vitex*; silky oak, the *Grevillea robusta*. Among the so-called native fruits, the plum and apple are the *Owenia*; orange and lime are the *Citrus*; cumquatis is the *Atalantia*; cherry, the *Exocarpus*; pomegranate, the *Capparis nobilis*; olive, the *Olea*; chestnut, the *Cantharosperrum australe*; pear, the *Xylomelum pyriforme*; quandong, the *Fusanus*; nut, the *Macadamia ternifolia*; tamarind, the *Diploglottis Cunninghamii*. The nonda, a native fruit, grows up to 60 feet. The nut of the bunya bunya, so prized by the blacks, is reserved over a district 30 miles by 12. Other trees are also protected by Government. The native grasses are nearly a hundred in number. The desert drought-resisting Mitchell grass is *Danthonia pectinata*; the weeping Polly is *Poa cæspitosa*; the dogtooth, *Chloris divaricata*; the blue star, *Chloris ventricosa*; the barcoo or Landesborough, *Anthistria membranacea*; the kangaroo, *Anthistria australis*; another kangaroo, *Andropogon refractus*; the rat-tail, *Andropogon nervosus*; the oat, *Anthistria venacea*; another perennial oat, *Microlæna stipoides*; the umbrella, *Aristida eramosa* and *Panicum virgatum*. The native carrot is *Daucus brachiatus*; the native plantain, *Plantago varia*; the sorghum or rice, *Aryza sativa*; and the bamboo, *Stipa ramosissima*. The salt-bush (*Atriplex*, *Rhagodia*, *Chenopodium*, &c.) is found useful in the absence of grasses. The danthonia and sporobolus strike deep roots. The Burdekin cane is relished by stock. The seeds of *Panicum laevinode* are used as food by the natives. Among plants poisonous to animals are the poison pea, fuchsia, scab-lily, indigo, thorn-apple, box, mistletoe, and nutgrass. Many English and foreign varieties of fodder are being now introduced. Useful fibres are of a number of kinds. Ferns are plentiful on the eastern side. Climbing ferns abound. *Grammitis ampla* has leaves a yard long. A Rockingham Bay fern, one foot high, has the habit of a tree fern. The epiphytes, growing on trees, are often very beautiful in tropical scrubs. Elk's horn, *Platycerium alccorne*, as well as the large stag's horn, are in much esteem. Forest ferns are similar to those in neighbouring colonies, excepting some tufted *Lindsæa*. The Australian bracken is peculiar to the southern hemisphere. Rock ferns are very graceful. The North Queensland *Asplenium laserpitilifolium* is greatly admired. A tropical *Aspidium*, with leaves 6 feet long, throws out runners. The *Grammitis Muelleri*, with scaly hairs, is peculiar to North Queensland. Swamp ferns are mostly seen to the northeast. Tree ferns attain magnificent proportions, rising 20 and 30 feet.

Fauna.—The Queensland fauna is much like that described under NEW SOUTH WALES. But forms are now living there whose allies are elsewhere recognized as Tertiary Fossils. The marsupials constitute a prominent family. The platypus or water mole is duck-billed and web-footed. The dingo is a howling, nocturnal dog. Queensland birds are very beautiful. One is something like the New Guinea bird of paradise. Other species of the feathered order are kindred to some in the Asiatic islands. Bower birds have a satin plumage, and indulge in play-bowers, adorned with shells and stones. The regent bird and rifle bird are peculiarly attractive in colours. Mound builders lay their eggs in sand heaps. The wild turkey and other game may be easily obtained. North Queensland has a fine cassowary. Reptiles consist of alligators, lizards, and snakes; few of the last, particularly of larger species, are hurtful to man.

Fisheries.—The sperm whale has become rare of late in North Australian seas. Deep-sea fishing is unknown in Queensland. About the coasts are the usual edible Australian forms, as whiting, rock cod, bream, flathead, schnapper, guardfish, &c. Sharks and alligators are there. The shell-grinder, *Cestracion*, is similar to a shark found as fossil in Europe. Sword fish grow to a great size. Some Queensland fish resemble varieties in Indian seas. The Chinese are the best fishermen in Australian waters. The huge dugong, or sea cow, feeding on bay grasses, has a delicate flesh, of the flavour of veal, and furnishes an oil with the qualities of cod-liver oil. The fishery of the trepang, *bêche-de-mer*, or sea slug, employs a considerable number of boats about the coral reefs.

Boiled, smoke-dried, and packed in bags, the trepang sells for exportation to China, though its agreeable and most nourishing soup is relished by Australian invalids. At Cooktown and Port Douglas more than £100 per ton may be had for the produce. The pearl fishery is a prosperous and progressive one in or near Torres Straits. A licence is paid, and the traffic is under Government supervision. Thursday Island is the chief seat of this industry. The shells are procured by diving, and fetch from £120 to £200 a ton. Mother-of-pearl and tortoiseshell constitute important exports of the colony, capable of great expansion. Oysters are as fine flavoured as they are abundant. Turtles are caught to the northward.

Commerce.—So extensive a coast-line, and so much of that protected by the Barrier Reef, cannot but be favourable to commerce. The Torres Strait mail service has opened up increased opportunities for trade with China, India, Java, &c. Contiguity to New Caledonia and the Pacific Isles will conduce to mercantile relations. There are several lines of coasting steamers. The great development of the mining, pastoral, and sugar industries, the rapid growth of railways, an easy tariff, and the settlements of York Peninsula are giving a great impetus to commerce. The exports for 1882 were £3,534,452; of which wool brought £1,329,019; gold £829,655; tin £269,904; stock £280,466; sugar £153,188; tallow £129,549; preserved meats £119,343; pearls £105,869; hides £88,359; *bêche-de-mer* £25,032. The imports for that year were £6,318,463. Among these imports some items may be cited:—for manufactured cotton, silk, and woollen goods £839,352; unmanufactured £194,489; for metal goods and hardware £910,029; flour and grain, £453,307; oilman's stores, £376,987; spirits, wines, and beer, £320,925; books and stationery, £113,798; tea, £109,286. Few of these articles are yet re-exported. The exports for 1883 advanced to £4,652,880, to which wool contributed £2,277,878, and sugar £538,785. The shipping exceeds 1,500,000 tons. Dock conveniences, ships, and colonial-made steam dredgers exercise the state care. The development of coal mines is aiding both shipping and railway extension. With the establishment of British rule in New Guinea, a serious danger to Queensland interests will be averted, and a happy opportunity offered for the enlargement of its commerce.

Manufactures.—The colony is too young, its population too scattered, its resources in raw material too extensive, for any great advance at present in the industrial stage. Yet already large foundries are established, in which agricultural instruments, mining machinery, sugar appliances, steam engines, and locomotives are constructed. Tanneries, breweries, sugar-mills, distilleries, tobacco-factories, cotton-ginning, woollen factories, wine-making, meat-preserving, boot-factories, &c., are being carried on. The sawmills near Maryborough are, perhaps, equal to anything in the southern hemisphere, relays of men working at night by electric light.

Roads and Railways.—Nearly ninety divisional boards, throughout the colony, raise means by rates for highway improvements, Government supplementing their revenue, as in the case of municipalities, by special grants in aid. Coaches travel inland 700 miles from the capital. At the end of 1884, besides several hundreds of miles of railway in process of construction, the lines opened to traffic were 1201 miles. The western line is from Brisbane, over Darling Downs, through Roma. The south-west will be reached by Cunnamulla. From Rockhampton westward the railway has gone 350 miles on towards the downs of the Barcoo. The line from Townsville, parallel to the last, after passing Charters Towers, will go on to Hughenden and the Flinders river region. The three great lines will be hereafter connected, and the Cloncurry and gulf country united with the western ports. Maryborough is thus connected with Gympie and Burrum, Bundaberg with Mount Perry, Brisbane with Warwick, and Brisbane with several suburbs. The heavy loans of the colony are mainly devoted to the construction of railways.

Administration.—The governor is appointed by the Queen. The executive council has 8 members, the legislative council 33, and the assembly 55. The term of parliament is five years. There were in January 1884 42 electorates, 18 municipalities, 4 boroughs, 85 divisional boards, 49 police districts. Excepting very occasional difficulties with blacks in remote and scrubby districts, order is thoroughly observed. Numerous religious and temperance organizations are of assistance in securing respect for law. Among official departments are those of the colonial secretary, treasurer, auditor-general, public works and mines, public lands, customs, administration of justice, post office, police, immigration, and medical board.

Revenue.—Of a revenue of £2,102,095 in 1881-2, £866,719 came from taxation. For the year ending June 30, 1884, the total was £2,566,358. Of this, the customs gave £866,475; excise, £34,441; land sales, £365,536; pastoral rents, £246,103; railways, £581,642; post and telegraph, £155,996. The expenditure was £2,317,674. In the settled districts, during 1883, 304 runs had an area of 11,162 square miles, at a rental of £21,419. In the unsettled districts 8939 runs had 475,601 square miles, paying £216,638, averaging less than a farthing an acre. Expired and renewed leases realize in-

creasing rates. The absolute public debt in 1884 was £16,570,850. Of that amount the outlay on railways was about 12 millions; immigration, 2; harbours, 1½. Roads and telegraph lines took other sums.

Education.—Queensland led the way among the Australian colonies, in the establishment of a system of public instruction free, unsectarian, and compulsory. At the same time, however, the parliament declined to grant further state aid to the clergy and religious edifices of Protestant Episcopalians, Presbyterians, Wesleyans, and Roman Catholics, formerly drawing from the treasury. State or provisional schools are formed wherever there is a sufficient gathering of children. The annual public cost was £2, 17s. per scholar. There are, however, self-supporting private schools. Masters and mistresses of state schools are paid by the Government according to their own educational status, the number of children, and the proficiency of instruction. Excellent training schools for teachers are established. Five superior grammar schools are partly supported by the state; the municipal councils have voluntarily aided those institutions, and offered scholarships to their pupils. The Government gives free education in grammar schools to successful scholars in state schools, besides three years' exhibitions to universities to a certain number passing a high examination. State aid is also rendered to schools of art, schools of design, free libraries, and technical schools.

Population.—The estimated population in January 1884 was 290,000, of whom three-fifths were males. Polynesian labourers, imported for three years, are about 8000. The Chinese, now restricted by a heavy poll tax, may be 18,000. The Aborigines, very fast dying out, mainly by contact with civilization, may be from 10,000 to 12,000.

History.—The Portuguese may have known the northern shore nearly a century before Torres, in 1605, sailed through the strait since called after him, or before the Dutch landed in the Gulf of Carpentaria. Captain Cook passed along the eastern coast in 1770, taking possession of the country as New South Wales. Flinders visited Moreton Bay in 1802. Oxley was on the Brisbane in 1823, and Allan Cunningham on Darling Downs in 1827. Sir T. L. Mitchell in 1846–7 made known the Maranoa, Warrego, and Barcoo districts. Leichhardt in 1845–47 traversed the coast country, going round the gulf to Port Essington, but was lost in his third great journey. Kennedy followed down the Barcoo, but was killed by the blacks while exploring York Peninsula. Burke and Wills crossed western Queensland in 1860. Landesborough, Walker, M'Kinlay, Hann, Jack, Hodgkinson, and Favence continued the researches. Squatters and miners have opened new regions. Before its separation in 1859 the country was known as the Moreton Bay district of New South Wales. A desire to form fresh penal depôts led to the discovery of Brisbane river in December 1823, and the proclamation of a penal settlement there in August 1826. The convict population was gradually withdrawn again to Sydney, and the place was declared open to free persons only in 1842. The first land sale in Brisbane was on August 9, 1843. An attempt was made in 1846, under the ministry of Sir James Graham and Mr Gladstone, to establish at Gladstone on Port Curtis the colony of North Australia for ticket-of-leave men from Britain and Van Diemen's Land. Earl Grey's Government under strong colonial appeals arrested this policy, and broke up the convict settlement. In 1841 there were 176 males and 24 females; in 1844, 540 in all; in 1846, 1867. In 1834 the governor and the English rulers thought it necessary to abandon Moreton Bay altogether, but the order was withheld. The first stock belonged wholly to the colonial Government, but flocks and herds of settlers came on the Darling Downs in 1841. In 1844 there were 17 squatting stations round Moreton Bay and 26 in Darling Downs, having 13,295 cattle and 184,651 sheep. In 1849 there were 2812 horses, 72,096 cattle, and 1,077,983 sheep. But there were few persons in Brisbane and Ipswich. The Rev. Dr Lang then began his agitation in England on behalf of this northern district. Some settlers, who sought a separation from New South Wales, offered to accept British convicts if the ministry granted independence. In answer to their memorial a shipload of ticket-of-leave men was sent in 1850. In spite of the objection of Sydney, the Moreton Bay district was proclaimed the colony of Queensland on December 10, 1859. The population was then about 20,000, and the revenue £6475. Little trade, no manufactures, wretched roads, defective wharfrage, struggling townships, and poor schools marked that epoch. Political liberty occasioned a general advance. The first parliament, with the ministry of Mr (now Sir R. G. W.) Herbert, organized a good school system, carried an effective land bill, and established real religious equality. While the pastoral interest rapidly grew, the agricultural and trading classes got firm footing. The revelation of gold and copper treasures increased the prosperity. But a reaction followed; wool prices fell, cotton-growing ceased, early sugar-cane efforts failed, and trouble succeeded excessive speculation in land and mines. A steady application to legitimate pursuits, however, soon restored confidence; and the colony, as its resources have gradually developed, has continued to advance and prosper. (J. BO.)

QUEENSTOWN, formerly **COVE OF CORK**, a market town and seaport in the county of Cork, Ireland, is picturesquely situated, 13 miles east-south-east of Cork, on the south side of Great Island, on the slope of an eminence rising somewhat abruptly above the inner Cork harbour. It consists chiefly of terraces, rising above each other, and inhabited by the wealthier classes. On account of the mildness of the climate it is much frequented by valetudinarians in winter. Previous to the American War the Cove of Cork was a very small fishing village, but within the last fifty years it has rapidly increased. It received its present name on the occasion of the visit of Queen Victoria in 1849. The harbour, which is 4 miles long by 2 broad, and is defended by the Carlisle and Camden Forts at its entrance, and by Fort Westmoreland on Spike Island, can afford shelter to a very large fleet of vessels. The port is the calling station for the American mail steamers. Among the principal buildings are the new Catholic cathedral for the diocese of Cloyne, and the Protestant Episcopal church for the united parishes of Clonmel and Temple Robin. A fine promenade, over a mile in length, connects Queenstown with Rushbrooke, a favourite watering-place. The population of Queenstown in 1871 was 10,334, and in 1881 it was 9755.

QUERCITRON is a yellow dye-stuff obtained from the bark of the quercitron oak, *Quercus tinctoria* (see vol. xvii. p. 693). The tree is a native of the United States, but is now also cultivated in France and South Germany. The dye-stuff is prepared by grinding the bark in mills after it has been freed from its black epidermal layer, and sifting the product to separate the fibrous matter, the fine yellow powder which remains forming the quercitron of commerce. The ruddy-orange decoction of quercitron contains quercitannic acid (vol. xvii. p. 692) and an active dyeing principle, quercitrin, $C_{33}H_{30}O_{17}$. The latter substance is a glucoside, and in aqueous solution under the influence of sulphuric acid it splits up into a rich tinctorial principle, quercetin, $C_{27}H_{18}O_{12}$, and a variety of sugar called isodulcite, $C_6H_{14}O_6$. The reaction may be thus formulated

Quercetin precipitates in the form of a crystalline powder of a brilliant citron yellow colour, entirely insoluble in cold and dissolving only sparingly in hot water, but quite soluble in alcohol. Either by itself or in some form of its glucoside quercitrin, quercetin is found in several vegetable substances, among others in cutch, in Persian berries (*Rhamnus catharticus*), buckwheat leaves (*Polygonum Fagopyrum*), Zante fustic wood (*Rhus Cotinus*), and in rose petals, &c. Quercitron was first introduced as a yellow dye in 1775. For many years it has been used principally in the form of **FLAVIN** (*q.v.*). Flavin is prepared by boiling quercitron in water and precipitating the tinctorial principle by sulphuric acid. By one method soda crystals are added in preparing the solution. The yellow precipitate is washed to free it from acid, pressed, and dried. From 100 parts of quercitron about 85 of flavin are obtained, having a tinctorial power more than twice that of the original bark. Quercitron and its industrial derivatives are principally employed in calico-printing. With alumina (red liquor mordant) they yield a bright canary colour, with tin salt a fine clear yellow, with iron liquor grey, olive, or black according to the strength of the mordant, and with mixed alumina and iron liquor an orange tint.

QUERÉTARO, a city of Mexico, capital of the state of the same name, lies on a plateau 5900 feet above the sea, 152½ miles north-west of Mexico by the Central Mexican Railway. It is a well-built place with a beautiful tree-planted alameda, a cathedral, and several handsome

churches and convents (Santa Clara, worthy of special note), a hospital, and other public buildings; and it is supplied with excellent water from the mountains by a great stone aqueduct erected at the expense of the Marquis de Villar del Aquila whose statue adorns one of the squares. In manufactures it occupies a high place, producing cotton and woollen goods, leather, soap, and wood-carvings. The great Hercules cotton-factory, about 2 miles by rail from the town, is enclosed by a high loop-holed wall and defended by a small company of soldiers; in this way the proprietors have maintained their position since 1840 in spite of all the revolutions that have swept over the country. About 1400 operatives (all Mexicans) are employed, and work is carried on both day and night. Unbleached cotton is the staple product. The population of the city was stated at 38,000 in 1882.

Querétaro was captured by the Spaniards in 1536, and made a city in 1655. In 1848 it was the seat of a congress by which peace between Mexico and the United States was ratified, and in 1867 the emperor Maximilian, unable to hold it against the republicans under Escobedo, was made prisoner and shot on the Cerro de las Campanas to the north of the town.

QUERN. See FLOUR, vol. ix. p. 343-4.

QUESNAY, FRANÇOIS (1694-1774), was one of the most eminent economists of the 18th century. He was born at Mérey, near the village of Montfort l'Amaury, about 28 miles from Paris, on the 4th of June, 1694, a year memorable also for the birth of Voltaire. He was the son of a worthy advocate, who had the reputation of ruining his own practice by reconciling the parties who came to consult him about their suits. The modest resources of the family were derived principally from the cultivation of a small landed estate, Quesnay's mother in particular busying herself much with the details of its management, which she thoroughly understood. His boyish years were thus spent amidst country scenes and the occupations of the farm, and he retained to the end a strong predilection for rural life and a special interest in the welfare of the agricultural population. Little attention was given to his early literary instruction; it is said that he could not read till he was eleven years of age, when he was taught partly by the family gardener, who used as the text book the *Maison Rustique* of Jean Liébault, a work "wherein" (to quote the words of its old English translator, Richard Surfleet, 1606) "is contained whatever can be required for the building or good ordering of a husbandman's house or country farm." This book Quesnay is said to have studied with such assiduity as to have almost known it by heart. He learned Greek and Latin and the elements of several sciences with scarcely any aid from masters. He was possessed with an ardent and untiring desire for knowledge, and we are told that more than once he walked to Paris for a book, which he read on his way back the same day, thus travelling twenty leagues on foot.

At the age of sixteen he became apprentice to a surgeon in the neighbourhood of Mérey, who was not able to teach him much, and he soon went to Paris to continue his professional education. He there devoted himself with great ardour for five or six years to the study of medicine and surgery, diligently attending the hospitals, and following the courses of anatomy, chemistry, and botany; he also learned drawing and engraving, in which he acquired considerable skill, and gave some attention to metaphysics, to which he had been attracted by the reading of Malebranche's *Recherche de la Vérité*. About 1718 he established himself at Mantes, and soon obtained a distinguished *clientèle*. He became known to the Maréchal de Noailles, who conceived a high esteem for him, and persuaded the queen, whenever she came to Maintenon, which was not very far from Mantes, to consult no physician but Quesnay. A celebrated practi-

tioner of the time, named Silva, having published a treatise on bleeding, which, though of little merit, was loudly applauded by his friends, Quesnay wrote a refutation of it, founded on the principles of hydrostatics, which brought his name much into notice. When La Peyronnie had procured about 1730 the foundation of an academy of surgery with the view of elevating that profession, he selected Quesnay for the post of perpetual secretary. Coming to Paris to fill it, he obtained through La Peyronnie's influence the office of surgeon in ordinary to the king. He was the author of the remarkable preface which was prefixed to the first volume of the *Mémoires* of the academy. He was for a long time much occupied with the controversies between the faculty of medicine and the college of surgery concerning the respective limits of the two professions, and wrote most of the pieces in which the claims of the latter were asserted. Finding that frequent attacks of the gout were rendering him incapable of performing manual operations, he procured in 1744 the degree of doctor of medicine from the university of Pont-à-Mousson; but, though thus changing the nature of his practice, he continued to defend the rights of the surgical profession. He soon after purchased the reversion to the office of physician in ordinary to the king, and afterwards became his first consulting physician; in this capacity he was installed in the palace of Versailles, occupying apartments near those of Madame de Pompadour. Louis XV. esteemed Quesnay much, and used to call him his thinker; when he ennobled him, he gave him for arms three flowers of the pansy (*pensée*), with the motto *Propter excogitationem mentis*.

He now devoted himself principally to economic studies, taking no part in the court intrigues which were perpetually going on around him. About the year 1750 he became acquainted with M. de Gournay, who was also an earnest inquirer in the economic field; and round these two distinguished men was gradually formed the philosophic sect of the *Économistes*, or, as for distinction's sake they were afterwards called, the *Physiocrates*. The most remarkable men in this group of disciples were the elder Mirabeau (author of *L'Ami des Hommes*, 1756-60, and *Philosophie Rurale*, 1763), the Abbé Baudeau (*Introduction à la Philosophie Économique*, 1771), Le Trosne (*De l'Ordre Social*, 1777), Morellet (best known by his controversy with Galiani on the freedom of the corn trade), Mercier Larivière, and Dupont de Nemours. Of the writings of the last two, as well as of the general doctrine of the physiocrats, some account has been given in the article *POLITICAL ECONOMY* (see vol. xix. pp. 359 *sq.*). The principal economic work of Quesnay himself was the *Tableau Économique*, which Laharpe called *l'Alcoran des Économistes*. A small *édition de luxe* of this work, with other pieces, was printed in 1758 in the palace of Versailles under the king's immediate supervision, some of the sheets, it is said, having been pulled by the royal hand. Already in 1767 the book had disappeared from circulation, and no copy of it is now procurable; but the substance of it is has been preserved in the *Ami des Hommes* of Mirabeau, and the *Physiocratie* of Dupont de Nemours. In Quesnay's *Maximes Générales du Gouvernement Économique d'un Royaume Agricole*, which was put forward as an *Extrait des Économies Royales de Sully*, and was printed along with the *Tableau* in 1758, besides stating his economic doctrines, he expresses his opinion in favour of a legal despotism as the best form of government. "Let the sovereign authority be single, and superior to all the individuals of society and all the unjust enterprises of private interest. . . . The system of counter-forces in a government is a harmful one, which produces only discord among the great and the oppression of the weak." He had contributed to the *Encyclopédie* in

1756 the articles "Fermiers" and "Grains," which contained the earliest announcement of his principles through the press; and he published a number of minor pieces in the *Journal de l'Agriculture, du Commerce, et des Finances*, and in the *Éphémérides du Citoyen*. His *Droit Naturel*, which was included in the *Physiocratie* of Dupont de Nemours, is especially noteworthy as showing the philosophic foundation of his economic system in the theory of the *jus naturæ*.

Interesting notices of Quesnay's character and habits have been preserved to us in the *Mémoires* of Marmontel and those of Mme. du Hausset, *femme de chambre* to Mme. de Pompadour.¹ His probity and disinterested zeal for the public good did not suffer from the atmosphere of the court; he never abused his credit with the sovereign or the favourite for any selfish end. To raise the national agriculture from the decay into which it had fallen and to improve the condition of the working population were the great aims he kept steadily in view. His conversation was piquant, humorous, and suggestive, often taking the form of moral and political apologues. Some of his weighty sayings are quoted by contemporary writers. Here is one of them. Having met in Madame de Pompadour's salon an official person who, in recommending violent measures for the purpose of terminating the vexatious disputes between the clergy and the parliament, used the words, "C'est la hallebarde qui mène un royaume," Quesnay replied, "Et qu'est ce qui mène la hallebarde?" adding, after a pause, "C'est l'opinion; c'est donc sur l'opinion qu'il faut travailler." Diderot, D'Alembert, Duclos, Helvetius, Buffon, Turgot, Marmontel, used to meet in his rooms in the palace, and also several of the physiocrats above named; and Madame de Pompadour, who affected the patronage of philosophy and science, sometimes came to join them and converse with them. Amongst them, when they were alone, subjects were sometimes discussed in a tone which would not have pleased the royal ear. Thus, one day, Mirabeau having said, "The nation is in a deplorable state," Larivière replied in prophetic words, "It can only be regenerated by a conquest like that of China, or by some great internal convulsion; but woe to those who live to see that! The French people do not do things by halves!" Adam Smith, during his stay on the Continent with the young duke of Buccleuch in 1764-66, spent some time in Paris, where he made the acquaintance of Quesnay and some of his followers; he paid a high tribute to their scientific services in his *Wealth of Nations*, and would have dedicated that work to Quesnay, had the latter been alive at the time of its publication.

At the age of seventy Quesnay went back to the study of mathematics. He thought, we are told, that he had discovered the quadrature of the circle, and was not prevented by the remonstrances of his friends from printing his supposed solution of the problem. He died in 1774, having lived long enough to see his great pupil, Turgot, in office as minister of finance. Quesnay had married in 1718, and had a son and a daughter; his grandson by the former was a member of the first Legislative Assembly.

The economic writings of Quesnay are collected in the 2d vol. of the *Principaux Économistes*, published by Guillaumin, with preface and notes by Eugène Daire. His writings on medicine and surgery have now only an historic interest. They were as follows:—1. *Observations sur les effets de la saignée*, 1780 and 1780; 2. *Essai physique sur l'économie animale avec l'art de guérir par la saignée*, 1786 and 1747; 3. *Recherches critiques et historiques sur l'origine*,

les divers états, et les progrès de la chirurgie en France (said to have been the joint work of Quesnay and Louis), 1744, and, with slightly altered title, 1749; 4. *Traité de la suppuration*, 1749; 5. *Traité de la gangrène*, 1749; 6. *Traité des fièvres continues*, 1758; 7. *Observations sur la conservation de la vie* (said to have been printed at Versailles along with the *Tableau Économique*), 1758. His other writings were the article "Évidence" in the *Encyclopédie*, and *Recherches sur l'évidence des vérités géométriques, avec un Projet de nouveaux éléments de géométrie*, 1773. Quesnay's *Éloge* was pronounced in the Academy of Sciences by Grandjean de Fouchy (see the *Recueil* of that Academy, 1774, p. 184). There is a good portrait of him, engraved by J. Ch. François, which is reproduced in the *Dictionnaire d'Économie Politique* of Coquelin and Guillaumin. (J. K. L.)

QUESNEL, PASQUIER (1634-1719), Roman Catholic theologian, was born in Paris on July 14, 1634, and, after graduating in the Sorbonne with distinction in 1653, joined the Congregation of the Fathers of the Oratory in 1657, receiving priest's orders in 1659. In 1675 he published an edition of the works of Leo the Great, in the notes to which the Gallican liberties were defended. The work was consequently put upon the *Index* in the following year, and Quesnel's relations with his ecclesiastical superiors became so strained that in 1681 he had to retire to Orleans. Four years later, finding himself unable to sign a document imposed on all members of the Oratory in condemnation of Jansenism, he fled to Brussels, where he was intimately associated with Arnould, and where, encouraged by him, he published in 1694-95 a complete edition of the *Réflexions Morales sur le Nouveau Testament*, a work of edification on which he had first begun to engage himself shortly after joining the Oratory, and a part of which had appeared as early as about 1671. The nature of its contents, and still more the known sympathies of its author, made the book an object of unwearying Jesuit hostility; Quesnel was imprisoned for a short time in the palace of the archbishop of Mechlin in 1703, but happily succeeded in escaping into Holland; his papers, however (compromising, it is said, to many persons), fell into the hands of the enemy, and long were to the Père La Chaise his "pot au noir" (as he called it) by means of which he was able to darken the prospects of his adversaries as he chose. The bull *Unigenitus*, in which no fewer than 101 sentences from the *Réflexions Morales* were condemned as heretical, was obtained from Clement IX. in September 8, 1713 (see vol. xiii. p. 567). Quesnel died at Amsterdam on December 2, 1719. A complete list of his works is given by Moreri.

QUETELET, LAMBERT ADOLPHE JACQUES (1796-1874), astronomer, meteorologist, and statistician, was born at Ghent, February 22, 1796, and educated at the lyceum of that town. In 1819 he was appointed professor of mathematics at the athénæum of Brussels; in 1828 he became lecturer at the newly created museum of science and literature, and he continued to hold that post until the museum was absorbed in the free university in 1834. In 1828 he was appointed director of the new royal observatory which it had been decided to found, chiefly at his instigation. The building was finished in 1832, and the instruments were ready for work in 1835, from which date the observations were published in 4to volumes (*Annales de l'Observatoire Royal de Bruxelles*), but Quetelet chiefly devoted himself to meteorology and statistics. From 1834 he was perpetual secretary of the Brussels Academy, and published a vast number of articles in its *Bulletin*, as also in his journal *Correspondance Mathématique et Physique* (11 vols., 1825-39). He died on February 17, 1874.²

Quetelet's astronomical papers refer chiefly to shooting stars and similar phenomena. He organized extensive magnetical and

¹ These *Mémoires* were first printed by Quintin Craufurd in his *Mélanges d'Histoire et de Littérature*, 1806, and again in 1817; they have since been published in the *Collection des Mémoires relatifs à la Révolution Française*, 1824, and also in the *Bibliothèque des Mémoires relatifs à l'Histoire de France pendant le 18^{me} Siècle*.

² His son ERNEST QUETELET (1825-78), was from 1856 attached to the observatory and made a great number of observations of stars with proper motion, from which a large catalogue of stars is now (1885) being published.

meteorological observations, and in 1839 he started regular observations of the periodical phenomena of vegetation, especially the flowering of plants. The results are given in various memoirs published by the Brussels Academy and in his works *Sur le Climat de la Belgique* and *Sur la Physique du Globe* (the latter forms vol. xiii. of the *Annales*, 1861). He is, however, chiefly known by the statistical investigations which occupied him from 1823 onward. In 1835 he published his principal work, *Sur l'Homme et le Développement de ses Facultés, ou Essai de Physique Sociale* (2d ed. 1869), containing a résumé of his statistical researches on the development of the physical and intellectual qualities of man, and on the "average man," both physically and intellectually considered. In 1846 he brought out his *Lettres à S. A. R. le Duc régnant de Saxe-Coburg et Gotha sur la théorie des probabilités appliquées aux sciences morales et politiques* (of which Sir J. Herschel wrote a full account in the *Edinburgh Review*), and in 1848 *Du Système Social et des Lois qui le régissent* (dedicated to the prince consort). In these works he shows how the numbers representing the individual qualities of man are grouped round the numbers referring to the "average man" in a manner exactly corresponding to that in which single results of observation are grouped round the mean result, so that the principles of the theory of probabilities may be applied to statistical researches on the subjects. These ideas are further developed in various papers in the *Bulletin* and in his *L'Anthropométrie, ou Mesure des différentes Facultés de l'Homme* (1871), in which he lays great stress on the universal applicability of the binomial law,—according to which the number of cases in which, for instance, a certain height occurs among a large number of individuals is represented by an ordinate of a curve (the binomial) symmetrically situated with regard to the ordinate representing the mean result (average height).

A detailed *Essai sur la Vie et les Travaux de L. A. J. Quételet*, by his pupil and assistant E. Mailly, was published at Brussels in 1875.

QUETTA, a valley in Baluchistan, and the most northern district in the province. It embraces an area of about 90 square miles, and is situated near the Afghan frontier between 30° 2' and 30° 14' N. lat. and between 66° 55' and 67° E. long. The general aspect of the country is hilly, rocky, and sterile, particularly towards the north; but in many parts the soil is rich and good, yielding wheat, rice, madder, tobacco, and lucerne, besides numerous grasses. The district has abundant orchards, furnishing grapes, apples, pears, pomegranates, figs, &c.; melons and all kinds of English vegetables are also largely cultivated. The valley is watered by the Lora stream. Wild sheep, goats, and hogs abound in the hills of the district. The climate appears to be healthy and the temperature moderate, ranging from 30° Fahr. in the winter to about 80° in the summer. Since 1876 Quetta has been the seat of a British political officer. Its occupation secures the Pishin valley, holds in check border tribes, and keeps open the roads of the Kojak and Gwaja passes over the Khwaja Amran range leading to Kandahar. During the Afghan campaigns of 1878–80 Quetta formed the base of operations of the southern column. In 1879 a railway was commenced to Quetta, with a view to its being pushed on to Kandahar. The line starts from the Sind railway system at Sukkur and runs via Jacobabad to Sibi, and is now in course of construction to Quetta; it is to be termed the Sind-Pishin railway. Quetta (or Shal, meaning "the fort" or "kot"), the capital, is situated at the northern extremity of the valley, near the head of the Bolan Pass and close to the Pishin valley, at an elevation of 5900 feet above the level of the sea. The town is surrounded by a mud wall; in its centre, on an artificial mound, is a fort which commands a very fine and extensive view of the neighbouring valley.

QUEVEDO VILLEGAS, FRANCISCO (1580–1645), the greatest satiric writer of Spain, was born in 1580 at Madrid, where his father, who came from the mountains of Burgos, was secretary to Anne of Austria, fourth wife of Philip II. Early left an orphan and without other protection than that of his guardian, D. Agustín de Villanueva, prothonotary of Aragon, the young man educated himself and chose his own career. Full of zeal to conquer all knowledge, he betook himself to Alcalá, the nearest university to Madrid,

where in a few years he covered a vast field of study, acquiring a knowledge of classical and modern tongues—of Italian and French, Hebrew and Arabic, of philosophy (or what passed by that name), theology, civil law, and economics. His masters were astounded at his erudition, and his fame reached beyond Spain; at twenty-one he was in correspondence with Justus Lipsius on questions of Greek and Latin literature, and the great scholar loaded him with praises and treated him as an equal. These years of study left a great and permanent influence on Quevedo's style; to them are due the pedantic traits and mania for quotations which strike and offend us in most of his works.

The licentiate of Alcalá next betook himself to the court and mingled with the corrupt society that surrounded Philip III., or rather the duke of Lerma, then the real ruler of Spain. The cynical greed of the ministers, the meanness of their flatterers, the corruption of all the royal officers, the financial scandals, the shamelessness of the women, brutalized by the low place given to them in family life and by the practices of a purely formalist religion, formed a spectacle which soon awoke in Quevedo his talent as a painter of manners. At Madrid or at Valladolid, where the court resided from 1601 to 1605, he mingled freely with these intrigues and disorders, and soon lost the purity of his morals, but not his independence, his uprightness and integrity. From this period date his first *Dreams* (*Sueños*), satirical fantasies in which the spirit and manner of Lucian and Dante are combined. "Dream of Skulls," "The Possessed Alguazil," "The Stables of Pluto," "The Madhouse of Love," such are the titles of these earliest writings composed in 1607–8, which in some degree recall the "Dances of Death" of the later Middle Ages; the author is transported in sleep to hell, where he assists at the long and lamentable procession of men of all conditions, professions, and trades who move toward their punishment, clad in their most characteristic vices and absurdities. The series was continued from 1612 to 1622 by "The World as it is" and the "Review of Witticisms." With the *Dreams* may be associated certain works of similar scope and tone, e.g., *To every one according to his Works*, and *Fortune made Reasonable*, where Jupiter in concert with Fortune, whom he has caused to stop her wheel, orders all kinds of men instantly to resume their true nature and the condition they deserve: thus the physician becomes a hangman, the accused a judge, the painted lady a duenna and witch, and so forth.

In 1609 Quevedo entered into relations with the famous D. Pedro Tellez Giron, duke of Osuna, with whom his fortunes were linked for more than ten years. The duke, celebrated for his bold enterprises of war against the Queen of the Adriatic, for his share in the conspiracy of Venice in 1618, for the luxurious splendour of his viceregal rule in Sicily and Naples, and finally for his terrible disgrace, recognized Quevedo's unusual merits and made him his secretary. Thus between 1611 and 1620 he learned politics,—the one science which he had perhaps till then neglected,—initiated himself into the questions that divided Europe, and penetrated the designs and ambitions of the neighbours of Spain as well as the secret history of the guilty intriguers protected by the favour of Philip III. The result was that he wrote several political works, particularly a lengthy treatise, *The Policy of God and the Government of Christ*, in which he lays down the duties of kings by displaying to them how Christ has governed His church. The disgrace of the duke of Osuna (1620) reached Quevedo, who was arrested and exiled to La Torre de Juan Abad in New Castile, where he possessed lands and of which he afterwards became seignior. Quevedo, though involved in the process against the

duke, remained faithful to him in his misfortunes, and bore exile and prison with resignation. On the death of Philip III. (31st March 1621), he recommended himself to the first minister of the new king by celebrating his accession to power and saluting him as the vindicator of public morality in an elegant epistle, in the style of Juvenal, on *The Present Habits of the Spaniards*. Olivares recalled him from his exile and gave him a charge in the palace, and from this time Quevedo resided almost constantly at court, where he acquired a position of great weight, only comparable to that of Voltaire in the France of last century. Like Voltaire, he became a sort of oracle, and exercised in Spain a kind of political and literary jurisdiction due to his varied relations and knowledge, but especially to his biting and unbridled wit, which had no respect of persons and laid bare every sore. General politics, social economy, war, finance, literary and religious questions, all fell under his dissecting knife, and he had a dissertation, a pamphlet, or a song for everything. One day he is defending St James, the sole patron of Spain, against a powerful coterie that wished to associate St Teresa with him, and meeting these antagonists with the vehemence of a warm patriot and the learning of a professional theologian; next day he is writing against the duke of Savoy, the hidden enemy of Spain, or against the measures taken to change the value of the currency; or once more he is engaged with the literary school of Gongora, whose affectations and designed obscurity of style seem to him to sin against the genius of the Castilian tongue. And in the midst of this incessant controversy on every possible subject he finds time to compose a comic romance, *Don Pablo de Segovia* (1626),—a masterpiece of sparkling verve and fun, which admirably continues the series of *Lazarillo de Tormes* and *Guzman de Alfarache*,—to pen a dissertation on *The Constancy and Patience of Job* (1631), to translate St Francis de Sales and Seneca, to compose thousands of verses, and to correspond with Spanish and foreign scholars.

But Quevedo was not to maintain unscathed the high position won by his knowledge, talent, and biting wit. The government of Olivares, which he had welcomed as the dawn of a political and social regeneration, made things worse instead of better, committed fault upon fault, and led the country to ruin. Quevedo saw this and could not hold his peace. An anonymous petition in verse enumerating to the king in strong terms the grievances of his subjects was found in the early part of December 1639 under the very napkin of Philip IV. It was shown to Olivares, who exclaimed, "I am ruined"; but before his fall he sought vengeance on the libeller. His suspicions fell on Quevedo, who had enemies glad to confirm them. Quevedo was arrested on December 7, and carried under a strong escort to the neighbouring convent of Leon, where he was kept in rigorous confinement till the fall of the minister (23d January 1643) restored him to light and freedom, but not to the health which he had lost in his dungeon. He had little more than two years to live, and these were spent in inactive retreat, first at La Torre de Juan Abad, and then at the neighbouring Villanueva de los Infantes, where he died September 8, 1645.

Quevedo was of middle height, with black, somewhat crisp hair, a very fair complexion, a broad forehead, and very sharp eyes always furnished with spectacles. The upper part of his body was well built but the lower part deformed: he limped, and his feet turned inwards. Though of very dissolute manners, he loved study most, and lived surrounded by books. He had a table on wheels for reading in bed and a stand that enabled him to read at table. His conversation, as one might guess from his books, was sparkling, full of unexpected turns and slyness, and many bon-mots are ascribed to him. A few days before his death, as he was about to dictate his last will, the curate who attested it invited him to assign a sum for music at his funeral. "Music!" said the dying man; "let those who hear it pay for that."

As a satirist and humorist Quevedo stands in the first rank of Spanish writers; his other literary work does not count for much. I. I. Chifflet, in a letter of February 2, 1629, calls him "a very learned man to be a Spaniard," and indeed his erudition was of a solid kind, but he merits attention not as a humanist, philosopher, and moralist, but as the keen polemic writer, the pitiless mocker, the profound observer of all that is wicked and absurd in human nature, and at the same time as a finished master of style and of all the secrets of the Spanish tongue. His style indeed is not absolutely pure, and already belongs to the period of decadence. Quevedo, who ridiculed so well the bad taste of "cultism," fell himself into another fault and created the style called "conceptism," which hunts after ambiguous expressions and "double entendres." But, though involved and overcharged with ideas, his style is of singular force and originality; after Cervantes he is the greatest Spanish writer of the 17th century.

There is an excellent collected edition of Quevedo's prose works with a good life of the author by D. Aureliano Fernandez-Guerra (*Bibl. Ribadeneyra*, vol. xxiii. and xlviii.); his poetical works in vol. lxi. of the same collection are badly edited by D. Florenzio Ianer. (A. M.-F.)

QUEZAL, or QUESAL, the Spanish-American name for one of the most beautiful of birds, abbreviated from the Aztec or Maya *Quetzal-tototl*, the last part of the compound word meaning fowl, and the first, also written *Cuetzal*, the long feathers of rich green with which it is adorned.¹ The Quetzal is one of the TROGONS (*q.v.*), and was originally described by Hernandez (*Historia*, p. 13), whose account was faithfully copied by Willughby. Yet the bird remained practically unknown to ornithologists until figured in 1825, from a specimen belonging to Leadbeater,² by Temminck (*Pl. col.*, 372) who, however, mistakenly thought it was the same as the *Trogon pavoninus*, a congeneric but quite distinct species from Brazil, that had just been described by Spix. The scientific determination of the Quetzal-bird of Central America seems to have been first made by Bonaparte in 1826, as *Trogon paradiseus*, according to his statement in the Zoological Society's *Proceedings* for 1837 (p. 101); but it is not known whether the fact was ever published. In 1832 the *Registro Trimestre*, a literary and scientific journal printed at Mexico, of which few copies can exist in Europe, contained a communication by Dr Pablo de la Llave, describing this species (with which he first became acquainted prior to 1810, from examining more than a dozen specimens obtained by the natural-history expedition to New Spain and kept in the palace of the Retiro near Madrid) under the name by which it is now commonly known, *Pharomacrus mocino*.³ These facts, however, being almost unknown to the rest of the world, Gould, in the *Zoological Proceedings* for 1835 (p. 29), while pointing out Temminck's error, gave the species the name of *Trogon resplendens*, which it bore for some time. Yet little or nothing was generally known about the bird until Delattre sent an account of his meeting with it to the *Echo du Monde Savant* for 1843, which was reprinted in the *Revue Zoologique* for that year (pp. 163-165). In 1860 the nidification of the species, about which strange stories had been told to the naturalist last named, was determined, and its eggs, of a pale bluish-green, were procured

¹ The Mexican deity Quetzal-coatl had his name, generally translated "Feathered Snake," from the *quetzal*, feather or bird, and *coatl*, snake, as also certain kings or chiefs, and many places, *e.g.*, Quetzalapan, Quetzaltepec, and Quetzaltenango, though perhaps some of the last were named directly from the personages (*cf.* Bancroft, *Native Races of the Pacific States*, vol. v., Index). Quetzal-itzli is said to be the emerald.

² This specimen had been given to Mr Canning (a tribute, perhaps, to the statesman who boasted that he had "called a New World into existence to redress the balance of the Old") by Mr Schenley, a diplomatist, and was then thought to be unique in Europe; but, apart from those which had reached Spain, where they lay neglected and undescribed, James Wilson says (*Illustr. Zoology*, pl. vi., text) that others were brought with it, and that one of them was given to the Edinburgh Museum. On the 21st day of the sale of Bullock's Museum in 1819, Lot 38 is entered in the Catalogue as "The Tail Feather of a magnificent undescribed Trogon" and probably belonged to this species.

³ De la Llave's very rare and interesting memoir was reprinted by M. Sallé in the *Revue et Magazin de Zoologie* for 1861 (pp. 23-33).

by Mr Robert Owen (*P. Z. S.*, 1860, p. 374; *Ibis*, 1861, p. 66, pl. ii. fig. 1); while further and fuller details of its habits (of which want of space forbids even an abstract here) were made known by Mr Salvin (*Ibis*, 1861, pp. 138-149) from his own observation of this very local and remarkable species. Its chief home is in the mountains near Coban in Vera Paz, but it also inhabits forests in other parts of Guatemala at an elevation of from 6000 to 9000 feet.

The Quezal is hardly so big as a Turtle-Dove. The

Quezal, male and female.

cock has a fine yellow bill and a head bearing a rounded crest of filamentous feathers; lanceolate scapulars overhang the wings, and from the rump spring the long flowing plumes which are so characteristic of the species, and were so highly prized by the natives prior to the Spanish conquest that no one was allowed to kill the bird when taken, but only to divest it of its feathers, which were to be worn by the chiefs alone. These plumes, the middle and longest of which may measure from three feet to three feet and a

half, with the upper surface, the throat, and chest, are of a resplendent golden-green,¹ while the lower parts are of a vivid scarlet. The middle feathers of the tail, ordinarily concealed, as are those of the Peacock, by the uropygials, are black, and the outer white with a black base. In the hen the bill is black, the crest more round and not filamentous, the uropygials scarcely elongated, and the vent only scarlet. The eyes are of a yellowish-brown. Southern examples from Costa Rica and Veragua have the tail-coverts much narrower, and have been needlessly considered to form a distinct species under the name of *P. costaricensis*. There are, however, some good congeneric species, *P. antisianus*, *P. fulgidus*, *P. auriceps*, and *P. pavoninus*, from various parts of South America, and, though all are beautiful birds, none possess the wonderful singularity of the Quezal. (A. N.)

QUEZALTENANGO, a city of Guatemala, capital of the province of its own name, lies on the Sigüila in a fertile district about 25 or 30 miles to the west of Lake Atitlan, on the high road between the city of Guatemala and the Mexican province of Chiapas. It has a cathedral and other public buildings, carries on the manufacture of cotton and wool, and contains from 20,000 to 30,000 inhabitants, mostly Indians. In the days of the Quiché power Quezaltenango, or, as it was then called, Xelahu, was one of the largest and most flourishing cities in the country. The Spanish city was founded by Alvarado in 1524.

QUIETISM, a peculiar form of MYSTICISM (*q.v.*) within the modern Catholic Church, mainly associated with the names of Madame GUYON and MIGUEL DE MOLINOS (*qq.v.*). See also FÉNELON.

QUILIMANE, or KILIMANE (the former being the Portuguese spelling), a Portuguese town on the east coast of Africa, at the head of a district of the province of Mozambique, lies 12 miles inland from the mouth of the river Quilimane or Qua Qua, which, an independent stream during the rest of the year, during the rainy season becomes a deltaic branch of the Zambesi, with which it is connected by Mutu, a cross channel or ditch. The town lies on the north bank of the river at a point where it is still about a mile broad, and as many as fifty coasting vessels may be seen at a time in the harbour. Large steamers are obliged to lie off the river mouth till high tide. Almost all the European merchants live in one long acacia-shaded street or boulevard skirting the river, while the Indian merchants or Banyans occupy another street running at right angles. The natives have their hut-clusters hid among the tropical vegetation which begins at the very end of the street and rapidly passes off into the uninvaded swamp-forest. The whole site is low and unhealthy, and the Portuguese have done next to nothing to improve it. The total population is between 6000 and 7000. Quilimane, at one time the capital of the Arab kingdom of Angoza, was seized by the Portuguese in the 16th century, and became in the 18th and the early part of the 19th the chief slave mart on the east coast of Africa. In modern times it has been the starting point of several exploring expeditions—notably of Livingstone's up the Zambesi to Lake Nyassa in 1861.

QUILL. See FEATHERS and PEN.

QUILLOTA, a town of Chili, at the head of a district in the province of Valparaíso, lies 30 miles by rail north-east of Valparaíso, on the south or left bank of the Aconcagua, about 20 miles from its mouth. It is one of the oldest towns in the country, and since the opening of the railway in 1863 it has grown so that in population

¹ Preserved specimens, if exposed to the light, lose much of their beauty in a few years, the original glorious colour becoming a dingy greenish-blue.

(11,369 in 1875) it is exceeded only by the capital and six other towns. It is famous for the quality of its chirimoyas (*Anona Cherimolia*) and lucumas; and in the neighbourhood there are rich copper mines. In 1822 and 1851 it suffered from earthquakes.

QUILON, a seaport town in Quilon district, Travancore state, Madras presidency, India, between the towns of Trevandrum and Aleppi, in 8° 54' N. lat. and 76° 37' E. long. It is a healthy town, and contained in 1881 a population of 13,588. It enjoys great facilities of water communication, and has an active export trade in timber, cocoa-nuts, ginger, pepper, &c. The outer point of the town (Tangacheri) is slightly elevated above the adjoining ground, and contains high cocoa-nut trees. Besides being a very projecting point, Quilon is rendered still more unsafe to approach by the bank of hard ground called the Tangacheri reef which extends some distance to the south-west and west of the point and along the coast to the northward. There is, however, good anchorage in a bight about 3 miles from the fort. Quilon is one of the oldest towns on the Malabar coast, and continued to be a place of considerable importance down to the beginning of the 16th century. It was garrisoned by a strong British force from 1803 to 1830; but the subsidiary force has since been reduced to one native regiment, whose cantonments lie to the east of the town. The town is 385 miles south-west of Madras.

QUIMPER, or **QUIMPER-CORENTIN**, a town of France, formerly the capital of the county of Cornouailles, and now the chief town of the department of Finistère, is situated 158 miles north-west of Nantes and 68 miles south-east of Brest on the railway between those towns. The delightful valley in which it lies is surrounded by high hills and traversed by the Steir and the Odet, which, meeting above the town, form a navigable channel for vessels of 150 tons during the rest of their journey to the sea (11 miles). With its communal population of 15,288, Quimper ranks in Finistère next to Brest and Morlaix. The only articles in which it has any considerable trade are fish and marine manures; and in 1882 the total movement of the port was 31 vessels (2976 tons) entering and 36 vessels (3352 tons) clearing. The real interest of the town lies in its old churches and its historic associations. Of the old town-walls a few portions are still preserved in the terrace of the episcopal palace and in the neighbourhood of the college. Quimper is the seat of a bishop belonging to the province of Rennes. The cathedral, dedicated to the patron saint St Corentin and erected between 1239 and 1515, has a fine façade, the pediment of which is crowned by an equestrian statue of King Grallon, and adorned (like several other external parts of the building) with heraldic devices cut in granite. Two lateral towers with modern spires (1854-56) and turrets reach a height of 247 feet. The total length of the building is 303 feet and its width 52, the length of the transept 118 feet and the height 66. The nave and the transept are in the style of the 15th century, and the central boss bears the arms of Anne of Brittany (1476-1514). The terminal chapel of the apse dates from the 13th century. In the side chapels are the tombs of several early bishops. The high altar, tabernacle, and ciborium are costly works of contemporary art. The pulpit panels represent episodes in the life of St Corentin. Of the other churches may be mentioned St Matthieu, rebuilt at the beginning of the 16th century, with a fine belfry; the church of Locmaria, dating from the 11th century; and the college chapel, in the "Jesuit" style. The old seminary is now used as a poorhouse, and there is also a lunatic asylum in the town. The public library in the town-hall possesses 25,000 volumes. The museum built in 1869-70 contains archæ-

ological collections and about 1300 paintings and drawings. In 1868 a bronze statue of Laennec the inventor of the stethoscope (born at Quimper in 1781) was erected in Place St Corentin.

Quimper, or at least its suburb Locmaria (which lies below the town on the left bank of the Odet), was occupied in the time of the Romans, and numerous traces of the ancient foundations still exist. At a later period Quimper became the capital of Cornouailles and the residence of its kings or hereditary counts. It is said to have been Grallon Meur (*i.e.*, the Great) who brought the name of Cornouailles from Great Britain and founded the bishopric, which was first held by St Corentin about 495. Ho el, count of Cornouailles, marrying the sister and heiress of Duke Conan in 1066, united the countship with the duchy of Brittany. Quimper was surrounded by walls in the course of the 13th century. It suffered greatly in the local wars of succession. In 1344 it was savagely sacked by Charles of Blois. Monfort did not succeed in his attempt to take the town by storm on August 11, 1345, but it opened its gates to his son John IV. in 1364 after the victory at Auray. At a later period it sided with the League. Besides Laennec, already mentioned, it has given birth to Kerguelen the navigator, Fréron the critic, Hardouin the antiquary, and Count Louis de Carne. Doubtless on account of its distance from the capital, Quimper, like Carpentras and Landerneau, has undeservedly been made a frequent butt of French popular wit.

QUINAULT, **PHILIPPE** (1635-1688), a dramatist of merit, and the only European writer who has made the opera libretto a work of literature (so much so that the popularity of opera may be said to be not a little due to him), was born at Paris on June 3, 1635. He was educated by the liberality of Tristan, the author of *Marianne*. His first play was produced at the Hôtel de Bourgogne in 1653 when Quinault was only eighteen. It is said that it was the occasion of an important innovation in dramatic history. Tristan had offered it and it had been accepted as his own at the price of a hundred crowns, which, though little enough, was twice the regular price of a few years before. When Tristan told the actors that it was the work of a novice they wished to throw up their bargain and only held to it on the terms of a ninth part of the receipts. The piece succeeded and Quinault followed it up, but he also read for the bar; and in 1660, when he married a widow with money, he bought himself a place in the Cour des Comptes. Then he tried tragedies (*Agrippa*, &c.) with more success than desert. He received one of the literary pensions then recently established, and was elected to the Academy in 1670.

Up to this time he had written some sixteen or seventeen comedies, tragedies, and tragi-comedies, of which the tragedies were mostly of very small value and the tragi-comedies not of much more. But his comedies—especially his first piece *Les Rivaux*, *L'Amant Indiscret* (1654) (which has some likeness to Molière's *Étourdi*, and was with it used to make up Newcastle's and Dryden's *Sir Martin Mar-all*), *Le Fantôme Amoureux* (1659), and *La Mère Coquette* (1665), perhaps the best—are much better. None of these styles, however, made Quinault worthy of a place here. In 1671 he contributed to the singular miscellany of *Psyche*, in which Corneille and Molière also had a hand, and which was set to the music of Lulli. Here he showed a remarkable faculty for lyrical drama, and from this time till just before his death he confined himself to composing libretti for Lulli's work. This was not only very profitable (for he is said to have received four thousand livres for each, which was much more than was usually paid even for tragedy), but it established Quinault's reputation as the master of a new style,—so much so that even Boileau, who had previously attacked and satirized his dramatic work, was converted, less to the opera, which he did not like, than to Quinault's remarkably ingenious and artist-like work in it. His libretti are among the very few which are readable without the music, and which are yet carefully adapted to it. They certainly do not contain very exalted poetry or very perfect drama.

But they are quite free from the ludicrous doggerel which (not merely in English) has made the name libretto a by-word, and at the same time they have quite enough dramatic merit to carry the reader, much more the spectator, along with them. It is not an exaggeration to say that Quinault, coming at the exact time when opera became fashionable out of Italy, had very much to do with establishing it as a permanent European *genre*. His first piece after *Psyche* was a kind of classical masque, *The Feast of Love and Bacchus* (1672). Then came *Cadmus* (1674), then in the same year and the three following *Alceste*, *Thésée*, *Atys* (one of his best-liked pieces), and *Isis*. All these, it may be observed, were classical in subject, and so was *Proserpine* (1680), which was superior to any of them. *The Triumph of Love* (1681) is a mere ballet, but in *Persée* and *Phaeton* Quinault returned to the classical opera. Then he finally deserted it for romantic subjects, in which he was even more successful. *Amadis* (1684), *Roland* (1685), and *Armide* (1686) are his masterpieces, the last being the most famous and the best of all. It should perhaps be observed that the very artificiality of the French lyric of the later 17th century and its resemblance to alexandrines cut into lengths were aids to Quinault in arranging lyrical dialogue. Lulli died in 1687, and Quinault, his occupation gone (for the two had now worked together for more than fifteen years, and it would probably have been difficult to find another composer equally well suited to his librettist), became devout, began a poem called the "Destruction of Heresy," and died on November 26, 1688. The best edition of his works is that of 1739 (Paris, 5 vols.).

QUINCE. Among botanists there is a difference of opinion whether or not the quince is entitled to take rank as a distinct genus or as a section of the genus *Pyrus*. It is not a matter of much importance whether we call the quince *Pyrus Cydonia* or *Cydonia vulgaris*. For practical purposes it is perhaps better to consider it as distinct from *Pyrus*, differing from that genus in the twisted manner in which the petals are arranged in the bud, and in the many-celled ovary, in which the numerous ovules are disposed horizontally, not vertically as in the pears. The quinces are much-branched shrubs or small trees with entire leaves, small stipules, large solitary white or pink flowers like those of a pear or apple, but with leafy calyxlobes, and a many-celled ovary, in each cell of which are numerous horizontal ovules. The common quince is a native of Persia and Anatolia, and perhaps also of Greece and the Crimea, but in these latter localities it is doubtful whether or not the plant is not a relic of former cultivation. By Franchet and Savatier *P. Cydonia* is given as a native of Japan with the native name of "maroumerou." It is certain that the Greeks knew a common variety upon which they engrafted scions of a better variety which they called *κυδώνιον*, from Cydon in Crete, whence it was obtained, and from which the names Cydonia, Codogno (Italian), Coudougner and Coing (French), Quitte (German), and Quince have been derived. Pliny (*H. N.*, xv. 11.) mentions that the fruit of the quince, *Malum cotoneum*, warded off the influence of the evil eye; and other legends connect it with ancient Greek mythology, as exemplified by statues in which the fruit is represented, as well as by representations on the walls of Pompeii. The fragrance and astringency of the fruit of the quince are well known, and the seeds are used medicinally for the sake of the mucilage they yield when soaked in water, a peculiarity which is not met with in pears. This mucilage is analogous to, and has the same properties as, that which is formed from the seeds of linseed. In English gardens three varieties are cultivated—the apple-shaped quince, the pear-shaped quince, and the Portugal quince; the last-named has larger

fruits than the other two (4 inches in length, 3–3½ in width), of a rich yellow colour when ripe and with less astringency, hence it is better suited for culinary and confectionary purposes than the other two, but is said to be somewhat more tender. The common quince and its varieties are very largely used as "dwarfing" stocks on which choice pears are engrafted. The effect is to restrain the growth of the pear, increase and hasten its fruitfulness, and enable it to withstand the effects of cold (see HORTICULTURE, vol. xii. p. 213). The common Japan quince, *Pyrus* or *Cydonia japonica*, is grown in gardens for the sake of its flowers, which vary in colour from creamy white to rich red, and are produced during the winter and early spring months. *C. Maulei*, a recently introduced shrub from Japan, bears a profusion of equally beautiful orange-red flowers, which are followed by fruit of a yellow colour and agreeable fragrance, so that, when cooked with sugar, it forms an agreeable conserve, as in the case of the ordinary quince. The fruit of the ordinary Japan quince is quite uneatable.

QUINCY, a city of the United States, the county seat of Adams county, Illinois, occupies a limestone bluff 125 feet above low-water mark on the east bank of the Mississippi at the extreme western point of the State. The river is crossed here by the great bridge of the Hannibal and St Joseph Railroad. Quincy Bay, an arm of the river, is the finest natural harbour for steamboats on the upper Mississippi. By water Quincy is 160 miles above St Louis, and by rail 263 miles south-west of Chicago *via* Galesburg. Commanding an extensive view, being well built, having excellent waterworks, and forming an important centre in the railway system of the region, Quincy is both an attractive and a prosperous place, with very miscellaneous industries. Among the public buildings are the court-houses, St John's cathedral (1877), a medical college (1873), a city library, and several hospitals and asylums. The population in 1860 was 13,718; in 1870, 24,052 (1073 coloured); and in 1880, 27,268 (1508 coloured). Laid out in 1825 or about three years after the arrival of the first white settler, Quincy was made a town in 1834, and a city in 1839.

QUINCY, a township and seaport of the United States, in Norfolk county, Massachusetts, on a small bay of its own name in the south of Massachusetts Bay and 7 miles south-south-east of Boston by rail. It is best known for its great granite quarries, in connexion with which was constructed in 1827 the first (horse) railway in the United States, and as the birthplace of Governor John Hancock and Presidents John Adams and John Quincy Adams. Among the principal buildings—chiefly situated in the village, which lies on an elevated plain near the centre of the township—are the granite town-house, the so-called Adams Temple (a church erected in 1828), beneath the portico of which are the tombs of the two Presidents Adams, the Adams Academy, a home for infirm sailors, a public library, and the mansions of the Quincy and Adams families, whose estates occupied the greater portion of the township. Quincy, which till 1792 formed part of Braintree, had 5017 inhabitants in 1850, 6779 in 1860, 7442 in 1870 and 10,570 in 1880.

QUINCY, JOSIAH, JR. (1744–1775), born in Boston, Mass., 1744, is the most eminent of a well-known family whose founder emigrated to New England in 1633. At the time of his death, at the age of thirty-one, he had won distinction as a lawyer, and his place was secured in history as among the most eloquent, the most clear-sighted, and the most devoted of the men who led the American colonists in the measures preliminary to the revolution. In 1767 he entered upon the public discussion of political questions, maintaining with great ability and courage the

duty of his countrymen to resist any encroachments upon their right to self-government. In 1770 he wrote *An Address of the Merchants, Traders, and Freeholders of Boston* in favour of a non-importation Act, asserting, about the same time, in a newspaper article that Americans would "know, resume, assert, and defend their rights" by the "arts of war" if "the arts of policy" should fail. In December 1773 he took an active and leading part in the town-meeting which virtually ordered the destruction of the cargoes of the tea-ships in Boston harbour. The appeal to the other towns for help to sustain Boston against the enforcement of the consequent Acts of Parliament was written by him; and soon after there appeared under his own name *Observations on the Boston Port Bill, with Thoughts on Civil Society and Standing Armies*, his longest and most important political paper, which made him a marked man both in England and America. He sailed a few months afterwards for England with the approval of the leading revolutionists, to present, though unofficially, to the ministry and other public men the grievances and the determination of the colonists. After six months failing health—he had long been threatened with consumption—compelled him to return home, and he died on shipboard as the vessel was entering the harbour of Gloucester, Massachusetts, April 26, 1775.

A memoir written by his only son, JOSIAH QUINCY (1772–1864), containing his life, correspondence, and the *Observations on the Boston Port Bill*, was published in 1825 (2d ed. 1874). This only son of Josiah Quincy, jun., born in Boston in February 1772, lived to be three times the age of his father, and filled public stations for more years than his father lived; he was a member of Congress during the eventful period from 1805 to 1813; as the second mayor of Boston his sagacity and energy insured the future prosperity of that city; in Congress he maintained at the head of the Federal party the struggle with the disastrous foreign policy of the administrations of Jefferson and Madison, and the dangerous growth of the slave-power, which he never ceased to oppose; as president of Harvard College for sixteen years (1829–45) he increased the usefulness and added to the influence of that seat of learning. He wrote a history of the college for two hundred years, which was also largely a history of Massachusetts. He died in June 1864 in the ninety-third year of his age. A life of him, by his youngest son Edmund Quincy, an accomplished scholar and well-known author, was published in 1867.

QUINET, EDGAR (1803–1875), was born at Bourg-en-Bresse, in the department of the Ain, France, on February 17, 1803. His father, Jerome Quinet, had been a commissary in the army, but being a strong republican and disgusted with Napoleon's usurpation, he gave up his post and resided either at Bourg or at a country house which he possessed in the neighbourhood, devoting himself to scientific and mathematical study. Edgar, who was an only child, was much alone, but his mother (whose name was Eugénie Rozat Lagis, and who was a person of education and strong though somewhat unorthodox religious views) exercised great influence over him. He was sent to school first at Bourg and then at Lyons, where he took no part in a celebrated barring out which led to the expulsion of his schoolfellow Jules Janin. On leaving school his father wished him to go into the army and then suggested business. But Quinet was determined upon literature, and after a time got his way. His first publication, the *Tablettes du Juif Errant*, appeared in 1823. Being struck with Herder's *Philosophie der Geschichte*, he undertook to translate it, learnt German for the purpose, published his work in 1827, and obtained by it considerable credit. At this time he was introduced to Cousin and made the acquaintance of Michelet. He had visited Germany and England before the appearance of his book. Cousin procured him a post on a Government mission to the Morea in 1829, and on his return he published in 1830 a book on *La Grèce Moderne*. Some hopes of employment which he had after the revolution of February were frustrated

by the reputation of speculative republicanism which he had acquired. But he joined the staff of the *Revue des Deux Mondes*, and for some years contributed to it numerous essays, the most remarkable of which was that on "Les Épopées Françaises du XII^{ème} Siècle," an early though not by any means the earliest appreciation of the long-neglected *chansons de geste*. *Ahasvérus*, his first original work of consequence, appeared in 1833. This is a singular prose poem in language sometimes rather bombastic but often beautiful. Shortly afterwards he married Minna Moré, a German girl with whom he had fallen in love some years before. Then he visited Italy, and, besides writing many essays, produced two poems, *Napoléon* (1835) and *Prométhée* (1838), which being written in verse (of which he was not a master) are inferior to *Ahasvérus*. In 1838 he published a vigorous reply to Strauss's *Life of Jesus*, and in that year he received the Legion of Honour. In 1839 he was appointed professor of foreign literature at Lyons, where he began the brilliant course of lectures afterwards embodied in the *Génie des Religions*. Two years later he was transferred to the Collège de France and the *Génie des Religions* itself appeared (1842).

Quinet's Parisian professorship was more notorious than fortunate, owing, it must be said, to his own fault. His chair was one of Southern Literature, but, neglecting his proper subject, he chose, in conjunction with Michelet, to engage in a violent polemic with the Jesuits and with Ultramontanism. Two books bearing exactly these titles, appeared in 1843 and 1844, and contained, as was usual with Quinet, the substance of his lectures. These excited so much disturbance and the author so obstinately refused to confine himself to literature proper that in 1846 the Government put an end to them—a course which was not disapproved by the majority of his colleagues. By this time Quinet was a pronounced republican and something of a revolutionist. He appeared in arms during the disturbances which overthrew Louis Philippe, and was elected by the department of the Ain to the Constituent and then to the Legislative Assembly, where he figured among the extreme Radical party. He had published in 1848 *Les Révolutions d'Italie*, one of his principal though not one of his best works. He wrote numerous pamphlets during the short-lived second republic, attacked the Roman expedition with all his strength, and was from the first an uncompromising opponent of Prince Louis Napoleon. He was banished from France after the *coup d'état*, and established himself at Brussels. His wife had died some time previously, and he now married Mademoiselle Assaki, the daughter of a Roumanian poet. At Brussels he lived for some seven years, during which he published *Les Esclaves* (1853), a dramatic poem, *Marnia de Ste Aldégonde* (1854), a study of that Reformer in which he very greatly exaggerates Sainte Aldegonde's literary merit, and some other books. He then moved to Veytaux on the shore of the Lake of Geneva, where he continued to reside till the fall of the empire. Here his pen was busier than ever. In 1860 appeared a singular book somewhat after the fashion of *Ahasvérus* entitled *Merlin l'Enchanteur*, in 1862 a *Histoire de la Campagne de 1815*, in 1865 an elaborate book on the French Revolution, in which the author, republican as he was, blamed the acts of the revolutionists unsparingly, and by that means drew down on himself much wrath from more thoroughgoing partisans. Many pamphlets date from this period, as does *La Création* (1870), a third book of the class of *Ahasvérus* and *Merlin*, but even vaguer, dealing not with history, legend, or philosophy, but with physical science for the most part.

Quinet had refused to return to France to join the Liberal opposition against Napoleon III., but immediately after Sedan he returned. He was then restored to his pro-

fessorship, and during the siege wrote vehemently against the Germans. He was elected deputy by the department of the Seine in 1871, and was one of the most obstinate opponents of the terms of peace between France and Germany. He continued to write till his death, which occurred at Versailles on the 27th March 1875. *Le Siège de Paris et la Défense Nationale* appeared in 1871, *La République* in 1872, *Le Livre de l'Exilé* in the year of its author's death and after it. This has been followed by three volumes of letters and some other work. Quinet had already in 1858 published a semi-biographic book called *Histoire de mes Idées*. The whole of his very numerous works, the chief of which have been already named, have appeared in a uniform edition of which some thirty volumes are now published. His second wife, in 1870, published certain *Mémoires d'Exil*. There is in English an elaborate *Early Life and Writings of Edgar Quinet*, by R. Heath (London, 1881), but it does not go beyond the year 1842.

Quinet's character was extremely amiable, and his letters to his mother, his accounts of his early life, and so forth are likely always to make him interesting. He was also a man of great moral conscientiousness, and as far as intention went perfectly disinterested, though it may perhaps be questioned whether the disappointment which he met with for years after the revolution of February had not an insensible influence in determining his republicanism. But he never temporized, and, as has been said above, hesitated not to criticize his own party as severely as his opponents. He had, however, as a writer, a thinker, and a politician, drawbacks which prevented him from taking the first rank, and which will probably make his works, except those which are purely personal, less and less read in the future. As a writer his chief fault is want of concentration, as a thinker and politician vagueness and want of practical determination. His work is very extensive and abounds in passages of great beauty. But no single book of his can be called a masterpiece, and none is of such a kind that the reader feels the subject to have been thoroughly treated in accordance with a definite and consistent principle or series of principles. Of verse he had but little command, and his abundance in a certain kind of effusive prose wants chastisement and criticism. The singular rhapsodies, of which in the three books *Ahasverus*, *Merlin*, and *La Création* he has left great store, are too diffuse, too inorganic, and too devoid of coherent and positive intention to rank very high. They are more like recorded dreams than anything else. His historical and philosophical works on the other hand, though showing much reading, fertile thought, abundant facility of expression, and occasionally, where prejudice does not come in, acute judgment, are rather (as not a few of them were in fact) reported lectures than formal treatises. His rhetorical power was altogether superior to his logical power, and the natural consequence is that his work is full of contradictions. These contradictions were, moreover, due not merely to an incapacity or an unwillingness to argue strictly, but also to the presence in his mind of a large number of inconsistent tastes and prejudices which he either could not or would not co-ordinate into an intelligible creed. Thus he has the strongest attraction for the picturesque side of mediævalism and catholicity, the strongest repulsion for the restrictions which mediæval and Catholic institutions imposed on individual liberty. He refused to submit himself to any form of positive orthodoxy, yet when a man like Strauss pushed unorthodoxy to its extreme limits Quinet revolted. As a politician he acted with the extreme Radicals, yet universal suffrage, the cardinal doctrine of Radicalism, disgusted him as unreasonable in its principle and dangerous in its results. His pervading characteristic, therefore, is that of an eloquent vagueness, very stimulating and touching at times, but as deficient in coercive force of matter as it is in lasting precision and elegance of form. He is less inaccurate in fact than Michelet, but he is also much less one-ideaed, and the result is that he seldom attains to the vivid representation of which Michelet was a master. (G. S.A.)

QUININE, the most important of the active principles contained in cinchona bark (see CINCHONA, vol. v. p. 780). Although the value of this bark in the treatment of intermittent fevers became widely known in 1638 through the cure of the countess of Chinchon, it was not until 1810 that any attempt was made to determine definitely the active principles to which its properties were due. In that year Gomez of Lisbon obtained a mixture of alkaloids by treating an alcoholic extract of the bark with water and then adding a solution of caustic potash. To this he gave the name of cinchonino. In 1820 two French

chemists, Pelletier and Caventou, proved that the cinchonino of Gomez contained two alkaloids which they named quinine and cinchonine. Some years afterwards quinidine and cinchonidine were discovered, and subsequently several other alkaloids, but in smaller quantity, in different varieties of the bark.

Chemistry.—The alkaloids appear to exist in cinchona bark chiefly in combination with cinchotannic and quinic acids, since solvents of the alkaloids in the free state do not dissolve out any from the powdered bark. The cinchotannic acid apparently becomes altered by atmospheric oxidation into a red-colouring matter, known as cinchono-fulvic acid or cinchona red, which is very abundant in some species, as in *C. succirubra*. For this reason those barks which, like *C. Calisaya*, *C. officinalis*, and *C. Ledgeriana*, contain but little colouring matter are preferred by manufacturers, the quinine being more easily extracted from them in a colourless form. The value of cinchona bark for the manufacture of quinine depends on the amount of quinine sulphate that can be prepared from it in the crystalline form. The exact mode of extraction adopted by manufacturers is kept a profound secret. That hitherto adopted by the Indian Government for the preparation of the cinchona febrifuge (see below) has the merit of simplicity, but the whole of the alkaloid present in the bark is not obtained by it. This method is to exhaust the powdered bark as far as possible by means of water acidulated with hydrochloric acid and then to precipitate the mixed alkaloids by caustic soda. Another method which is said to give better results consists in mixing the powdered bark with milk of lime, drying the mass slowly with frequent stirring, exhausting the powder with boiling alcohol, removing the excess of alcohol by distillation, adding sufficient dilute sulphuric acid to dissolve the alkaloid and throw down colouring matter and traces of lime, &c., filtering, and allowing the neutralized liquid to deposit crystals. The sulphates of the alkaloids thus obtained are not equally soluble in water, and the sulphate of quinine can consequently be separated by fractional crystallization, since, being less soluble in water than the other sulphates, it crystallizes out first.

The quinine of commerce is the neutral sulphate, containing $7\frac{1}{2}$ molecules of water of crystallization, and having the formula $(C_{20}H_{24}N_2O_8)_2 \cdot H_2SO_4 + \frac{1}{2}H_2O$. When crystallized from alcohol, or when dried over sulphuric acid, it contains only 2 molecules. Cownley has shown that the salt containing 2 molecules of water is the most permanent one, for when the commercial sulphate containing $7\frac{1}{2}$ molecules is dried at 100° C. it becomes anhydrous, and when subsequently exposed freely to the air it rapidly absorbs 2 molecules of water; and that the commercial salt, if exposed to the air, effloresces until only 2 molecules of water are retained.¹

Two other sulphates are known. The one contains a single equivalent of acid, and in commerce bears the name of acid sulphate or soluble sulphate of quinine; it is soluble in 11 parts of water, but with considerable difficulty in absolute alcohol. The other sulphate contains 2 equivalents of sulphuric acid, is very soluble in cold water, but quite insoluble in ether; it is not an article of commerce. Both these sulphates crystallize with 7 molecules of water.

The neutral sulphate of quinine occurs in commerce in the form of slender white acicular crystals, which are very light and bulky. It is soluble in about 740 parts of cold water, but in 30 of boiling water, 60 of rectified spirits of wine (sp. gr. 0.85), and 40 of glycerin. Its solubility in water is lessened by the presence of sodium or magnesium sulphate, but is increased by nitrate of potassium,

¹ *Pharm. Jour.*, [3], vol. vii. p. 189.

chloride of ammonium, and most acids. It is not soluble in fixed oils or in ether, although the pure alkaloid is soluble in both. It becomes phosphorescent on trituration. When prescribed it is generally rendered more soluble in water by the addition of dilute sulphuric acid or of citric acid, one drop of the former or $\frac{1}{4}$ th of a grain of the latter being used for each grain of the sulphate of quinine.

When a solution of quinine is exposed to sunlight it assumes a yellowish or brown colour due to the formation of "quiniretin," a body which is isomeric with quinine but has not an alkaline reaction, is not precipitated by tannin, and has an aromatic as well as a bitter taste. Quinine is precipitated from its solution by alkalies and their carbonates. It is very soluble in solution of ammonia, and also slightly soluble in lime water.

The acid solution of sulphate of quinine is fluorescent, especially when dilute; it is levogyrate; and when a solution of chlorine is first added and then ammonia an emerald green colour, due to the formation of thalleoquin, is developed. This test answers with a solution containing only 1 part of quinine in 5000, or in a solution containing not more than $\frac{1}{20,000}$ part if bromine be used instead of chlorine. The fluorescence is visible in an acid solution containing one part in 200,000 of water.

Quinine forms with sulphuric acid and iodine a compound known as herapathite, $4C_{20}H_{24}N_2O_2 \cdot 3SO_4H_2 \cdot 6I + 3H_2O$, which possesses optical properties similar to those of tourmaline; it is soluble in 1000 parts of boiling water; and its sparing solubility in cold alcohol has been utilized for estimating quinine quantitatively. The other alkaloids are distinguished from quinine thus:—quinidine resembles quinine, but is dextrogyrate, and the iodide is very insoluble in water; the solution of cinchonidine, which is levogyrate, does not give the thalleoquin test, nor fluorescence; cinchonine resembles cinchonidine in these respects, but is dextrogyrate.

Commercial sulphate of quinine frequently contains from 1 to 10 per cent. of the sulphate of cinchonidine owing to the use of barks containing it. The sulphate of cinchonidine is more soluble than that of quinine; and, when 1 part of quinine sulphate suspected to contain it is nearly dissolved in 24 parts of boiling water, the sulphate of quinine crystallizes out on cooling, and the cinchonidine is found in the clear mother liquor, from which it can be precipitated by a solution of tartrate of potassium and sodium. Samples of quinine in which cinchonidine is present usually contain, according to Hesse, a smaller percentage of water than the pure sulphate, the cinchonidine salt exercising a reducing influence on the quinine salt in this respect. Traces of quinidine are also sometimes, though rarely, found in commercial quinine, but, since quinidine is even more valuable as a medicine than quinine, its presence does not detract in a medicinal point of view from the value of the latter.

Owing to its voluminous character, as much as 18 per cent. of water may remain present in apparently dry samples of sulphate of quinine. If it loses more than 14.6 per cent. of water when dried at $100^\circ C$. it contains an excessive amount of moisture. Owing to its variability in this respect the hydrochlorate of quinine has been recommended as a more constant salt; it also possesses advantages from a therapeutical point of view.

Sulphate of quinine manufactured from cuprea bark (*Remijia pedunculata*) is liable to contain from 10 to 90 per cent. of sulphate of homoquinine, which almost coincides in solubility with sulphate of quinine. Homoquinine has been shown by Paul and Cownley to be decomposed on treatment with caustic soda into quinine and a new alkaloid, cupreine, in the proportion of 2 to 3.

They have also shown that cupreine is soluble in a solution of caustic soda (differing in this respect from quinine), and that therefore it is easy to prepare sulphate of quinine perfectly free from either homoquinine or cupreine. So far as the medicinal properties of cupreine and homoquinine are at present known they appear to be of no practical importance.¹

In consequence of the high price of the alkaloid an attempt was made a few years since by the Government of India to manufacture from cinchona bark a cheap febrifuge which should represent the alkaloids contained in the bark and form a substitute for quinine. This enterprise met with such success that in 1884 as much as 8714 lb of the febrifuge were prepared; and during the previous year 9144 lb were distributed, of which 4880 lb were supplied to the Government institutions at a cost of little more than a rupee per ounce.

This mixture is known as cinchona febrifuge, and is prepared chiefly from *C. succirubra*, which succeeds better in India than the other species in cultivation, and grows at a lower elevation, being consequently procurable in large quantities at a comparatively low price. A mixture of the cinchona alkaloids, consisting principally of cinchonidine sulphate, with smaller quantities of the sulphates of quinine and cinchonine, is sold under the name of "quine-tum" at a cheaper rate than quinine.

In 1870 the Indian Government purchased no less than 81,600 ounces of sulphate of quinine, besides 8832 ounces of the sulphates of cinchonine, cinchonidine, and quinidine; but at the present date it is able to meet the requirements of its establishments almost entirely by the cinchona febrifuge prepared at the Government plantations in India.

Although quinine is manufactured in the United States, a large quantity has been imported from Europe since the high duty levied on its manufacture has been removed. There is considerable difficulty in obtaining trustworthy statistics as to the extent of the manufacture of quinine. The largest sale that has taken place in America appears to have been in 1883, when $1\frac{1}{2}$ tons were put up to auction, and in the same year 16,000 ounces were sold in London and a similar quantity at Berlin.

Physiological Action.—Quinine arrests the movements of the white corpuscles of the blood, rendering them round and darkly granulate, and, by preventing them from making their exit from the blood-vessels, diminishes or arrests the formation of pus in inflammation and causes contraction of the spleen when that organ is enlarged. It acts upon the cerebro-spinal nervous system, giving rise to headache and a sense of tension in the brain; these symptoms may be removed by the addition of hydrobromic acid or prevented by the use of the hydrobromide of quinine. It acts through the sympathetic nervous system on the heart, and is thus capable of restraining all the animal processes which develop heat, organic changes, or muscular action. It is antagonistic to atropine in its physiological action.

The use of quinine in medicine dates from its discovery in 1820. Its chief value is as an antiperiodic, especially in intermittent fevers, but also in other diseases when they assume a periodic character, such as neuralgia, asthma, whooping cough, &c. In blood poisoning, whether arising from natural or traumatic causes, it has been found of great utility. Its curative powers in sunstroke have been repeatedly proved in the East Indies, and a dose of quinine will often cut short an attack of catarrh if taken in the early stage. In malarial districts persons have

¹ *Pharm. Jour. and Trans.*, [8], vol. xii. p. 497, and vol. xv. p. 729.

been exposed to miasmatic influence without danger after taking a dose or two of five grains of quinine once or twice a day. In the smallest medicinal doses it is purely tonic, in larger ones stimulant; but it differs from other medicines of the same class in the stimulant action being longer sustained. In large doses it acts as a sedative, and in excessive doses it is poisonous. In some individuals it produces an erythematous eruption, and it is also known to act as an oxytocic. Large doses also sometimes produce deafness, and act injuriously in all inflammatory states of the mucous membrane.

The other alkaloids of cinchona bark—quinidine, cinchonidine, and cinchonine—also possess similar properties, quinidine being even more effectual than quinine; but cinchonine appears to produce nausea and gastric disturbance. This is also the case with the cinchona febrifuge prepared from *C. succirubra*.

Until the year 1867 English manufacturers of quinine were entirely dependent upon South America for their supplies of cinchona bark, which were obtained exclusively from uncultivated trees, growing chiefly in Bolivia, Peru, and Ecuador, the principal species which were used for the purpose being *Cinchona Calisaya*, Wedd.; *C. officinalis*, Hook.; *C. macrocalyx*, var. *Palton*, How.; *C. Pitayensis*, Wedd.; *C. micrantha*, R. and P.; and *C. lancifolia*, Mntis. Since the cultivation of cinchona trees was commenced in Java, India, Ceylon, and Jamaica, several other species, as well as varieties and hybrids cultivated in those countries, have been used.¹ Recently *C. lancifolia*, var. *Calisaya*, Wedd., known as the calisaya of Santa Fé, has been strongly recommended for cultivation, because the shoots of felled trees afford bark containing a considerable amount of quinine; *C. Pitayensis* has also been lately introduced into the Indian plantations on account of yielding the valuable alkaloid quinidine, as well as quinine, but the last two species have not as yet been grown in sufficient quantities to afford marketable bark.

The first importation from India took place in 1867, since which time the cultivated bark has arrived in Europe in constantly increasing quantities, London being the chief market for the Indian barks and Amsterdam for those of Java. The principal sales take place in May. In 1876, when Indian calisaya bark first came into the European market, the imports into London were the following:—*Cinchona succirubra*, 45,000 lb; *C. officinalis*, 20,000 lb; *C. Calisaya*, 1000 lb. During the last few years *Cinchona Calisaya* has also been cultivated extensively in Bolivia and in Tolima, United States of Colombia, and this bark, which had almost disappeared from commerce, is likely in a few years to again become an available source of quinine.

In order to obtain the cultivated bark as economically as possible, experiments were made some years ago by M'Ivor and others which resulted in the discovery that, if the bark were removed from the trunks in alternate strips so as not to injure the cambium, or actively growing zone, a new layer of bark was formed in one year which was richer in quinine than the original bark and equal in thickness to that of two or three years' ordinary growth. This is known in commerce as renewed bark. The process has been found to be most conveniently practised when the trees are eight years old, at which age the bark separates most easily. The yield of quinine has been ascertained to increase annually until the eleventh year, at which it seems to reach its maximum. The portion of the trunk from which the bark has been removed is sometimes protected by moss, and the new bark which forms is then distinguished by the name of mossed bark. The species which yield the largest amount of quinine are by no means the easiest to cultivate, and experiments have consequently been made in cross-fertilization and grafting with the view of giving vigour of growth to delicate trees yielding a large amount of alkaloid or of increasing the yield

in strong growing trees affording but little quinine. Grafting, however, has not been found to answer the purpose, since the stock and the graft have been found to retain their respective alkaloids in the natural proportion just as if growing separately. Hybridization also is very uncertain, and is very difficult to carry out effectually; hence the method of propagating the best varieties by cuttings has been adopted except in the case of those which do not strike readily, as in *C. Ledgeriana*, in which the plants are grown from the shoots of felled trees.

A few years ago it was discovered that a bark imported from the United States of Colombia under the name of cuprea bark, and derived from *Remijia pedunculata*, Triana, and other species, contained quinine to the extent of $\frac{1}{2}$ to $2\frac{1}{2}$ per cent., and in 1881 this bark was exported in enormous quantities from Santander, exceeding in amount the united importations of all the other cinchona barks; and by reason of its cheapness this has since that date been largely used for the manufacture of quinine.

The imports of cinchona bark into London in 1884, including cuprea bark, are stated to have been 59,287 bales, into France 9271 bales, and into New York 8150 bales.

Cinchona bark as imported is never uniform in quality. The South-American kinds contain a variable admixture of inferior barks, and the cultivated Indian barks comprise, under the respective names of yellow, pale, and red barks, a number of varieties of unequal value. For this reason a sample from every bale is analysed before the importations are offered for sale.

The alkaloids are contained, according to Howard, chiefly in the cellular tissue next to the liber. No definite knowledge has as yet been attained of the exact steps by which quinine is formed in nature in the tissues of the bark, nor have the numerous endeavours that have been made to build up quinine artificially or to obtain some idea of its constitution by splitting it up into its component parts been more successful. Nearly all that is known at present has resulted from analyses of the leaves, bark, and root. From these it appears that quinine is present only in small quantities in the leaves, in larger quantity in the stem bark, and increasing in proportion as it approaches the root, where quinine appears to decrease and cinchonine to increase in amount, although the root bark is generally richer in alkaloids than that of the stem. The altitude at which the trees are grown seems to affect the production of quinine, since it has been proved that the yield of quinine in *C. officinalis* is less when the trees are grown below 6000 feet than above that elevation, and that cinchonidine, quinidine, and resin are at the same time increased in amount. It has also been shown by Broughton that *C. peruviana*, which yields cinchonine but no quinine at a height of 6000 feet, when grown at 7800 feet gives nearly as much crystallized sulphate of quinine, and almost as readily, as *C. officinalis*. Karsten also ascertained by experiments made at Bogota on *C. lancifolia* that the barks of one district were sometimes devoid of quinine, while those of the same species from a neighbouring locality yielded $3\frac{1}{2}$ to $4\frac{1}{2}$ per cent. of the sulphate; moreover, Dr De Vrij found that the bark of *C. officinalis* cultivated at Utakamand varied in the yield of quinine from 1 to 9 per cent. In these cases the variation may have been due to altitude. Free access of air to the tissues also seems to increase the yield of quinine, for the renewed bark is found to contain more quinine than the original bark.

QUINSY. See TONSILLITIS.

QUINTANA, MANUEL JOSÉ (1772-1857), Spanish poet and man of letters, was born at Madrid on April 11, 1772, and after completing his studies at Salamanca was called to the bar. In 1801 he produced an unsuccessful tragedy *El Duque de Visco*; his *Pelayo* (1805), appealing as it did to the spirit of resistance to foreign oppression, was much more successful. The first volume of his somewhat rhetorical and superficial *Vidas de Españoles Célebres*, in 1807, containing lives of Spaniards who had successfully opposed the enemies of their country, was similar in motive, and at the outbreak of the revolution of 1808 Quintana, as journalist (*Variedades*, and *Semanario patriótico*), as secretary to the cortes and the regency, and also as "the Spanish Tyrtæus" (*Odas á España libre*, 1808), rendered important services to the patriotic cause. On the return of Ferdinand VII. in 1814 he shared the fate of other "liberals" or "constitutionalists," and had to endure six years' imprisonment in Pamplona, obtaining his release only in 1820, when he was named president of the department of public instruction under the new Govern-

¹ In Java, *C. Calisaya*, vars. *anglica*, *javanica*, *Hasskarliana*, and *Ledgeriana*; *C. officinalis*, var. *angustifolia*; *C. lancifolia*; *C. caloptera*, Miq.; *C. micrantha* and *C. succirubra*, How. In India, *C. succirubra*, *C. officinalis*, vars. *angustifolia*, *crispa*, *Uritusina*, and *Bonplandiana*, and to a lesser extent *C. Calisaya*, vars. *Boliviana* and *microcarpa*; *C. micrantha*, *C. Peruviana*, How., and *C. nitida*, R. and P., form only a small proportion of the plantations. Since Mr J. E. Howard, the eminent quinologist, pointed out that *C. Pahradiana*, How., and *C. Calisaya*, vars. *javanica*, *Hasskarliana*, and *anglica*, were likely to lead to disappointment as quinine-yielding species, these have been replaced in the plantations as rapidly as possible by the more valuable species, of which *C. Ledgeriana*, yielding from 5 to 10 per cent. or even more of quinine, *C. officinalis*, and a hybrid between *C. officinalis* and *C. succirubra* which has been named *C. robusta*, Trimen, are the most important.

ment. The counter-revolution of 1823 again drove him from office, to which he was once more restored after the death of the king in 1833. In 1835 he was made a senator and peer; and in 1855, at a meeting of the cortes, a laurel crown was placed on his head by Queen Isabella II., whose "governor" he had been during her minority. He died at Madrid on March 11, 1857.

The works of Quintana form the 19th volume in Ribadaneira's *Biblioteca de Autores Españoles* (1852). The third and last volume of the *Vidas* appeared in 1833. The biographies of Nuñez de Vilboa, Pizarro, The Cid, Guzman el Bueno, Gonsalvo de Cordova, and one or two others have been translated into English.

QUINTILIAN (M. FABIVS QUINTILIANVS) was born in the obscure Spanish town of Calagurris (Calahorra), on the Ebro, in the country of the Vascones, not later than 35 A.D. Concerning his family and his life but few facts remain. His father taught rhetoric, with no great success, at Rome, and Quintilian must have come there at an early age to reside, and must have there grown up to manhood. The years from 61 to 68 he spent in Spain, probably attached in some capacity to the retinue of the future emperor Galba, with whom he returned to the capital. Quintilian must have brought back with him a considerable reputation as a rhetorician. For at least twenty years after the accession of Galba he was at the head of the foremost school of oratory in Rome, and may fairly be called the Isocrates of his time. He also gained some but not a great repute as a pleader in the courts. His greatest speech appears to have been a defence of the queen Berenice, on what charge is not known. For a member of a learned profession his circumstances were easy; but the question of Juvenal, "How is it that Quintilian owns so many estates?" ought perhaps not to be accepted as evidence of great wealth. Vespasian created for him a professorial chair of rhetoric, liberally endowed with public money, and from this time he was unquestionably, as Martial calls him, "the supreme controller of the restless youth." About the year 88 Quintilian retired from teaching and from pleading, to compose his great work on the training of the orator (*Institutio Oratoria*). After two years' retirement he was entrusted by Domitian with the education of two grand-nephews, whom he destined as successors to his throne. Quintilian gained the titular rank of consul, and probably died not long before the accession of Nerva (96 A.D.). A good many years earlier his wife had died at the age of nineteen, leaving him two sons, one of whom died when seven years old, the other in his eleventh year, while the father was engaged upon his great work.

Such is the scanty record that remains of Quintilian's uneventful life. But it is possible to determine with some accuracy his relation to the literature and culture of his time, which he powerfully influenced. His career brings home to us the vast change which in a few generations had passed over Roman taste, feeling, and society. In the days of Cicero rhetorical teaching had been entirely in the hands of the Greeks. Even Cicero, when he wrote his rhetorical works, was driven to plead that it could not be disgraceful to teach what it was not disgraceful to learn. The Greek language, too, was in the main the vehicle of instruction in rhetoric. The first attempt to open a Latin rhetorical school, in 94 B.C., was crushed by authority, and not until the time of Augustus was there any professor of the art who had been born to the full privileges of a Roman citizen. The appointment of Quintilian as professor by the chief of the state marks the last stage in the emancipation of rhetorical teaching from the old Roman prejudices.

During the hundred years or more which elapsed between the death of Cicero and the birth of Quintilian education all over the Roman empire had spread enor-

mously, and the education of the time found its end and climax in rhetoric. Mental culture was for the most part acquired, not for its own sake, but as a discipline to develop skill in speaking, the paramount qualification for a public career. Rome, Italy, and the provinces alike resounded with rhetorical exertitions, which were promoted on all sides by professorships, first of Greek, later also of Latin rhetoric, endowed from municipal funds. The mock contests of the future orators roused a vast amount of popular interest. In Gaul, Spain, and Africa these pursuits were carried on with even greater energy than at Rome. The seeds of the existing culture, such as it was, bore richer fruit on the fresh soil of the Western provinces than in the exhausted lands of Italy and the East. While Quintilian lived, men born in Spain dominated the Latin schools and the Latin literature, and he died just too soon to see the first provincial, also of Spanish origin, ascend the imperial throne.

As an orator, a teacher, and an author, Quintilian set himself to stem the current of popular taste which found its expression in what we are wont to call silver Latin. In his youth the influence of the younger Seneca was dominant. But the teacher of Quintilian was a man of another type, one whom he ventures to class with the old orators of Rome. This was Domitius Afer, a rhetorician of Nîmes, who rose to the consulship. Quintilian, however, owed more to the dead than to the living. His great model was Cicero, of whom he speaks at all times with unbounded eulogy, and whose faults he could scarce bring himself to mention; nor could he well tolerate to hear them mentioned by others. The reaction against the Ciceronian oratory which had begun in Cicero's own lifetime had acquired overwhelming strength after his death. Quintilian failed to check it, as another teacher of rhetoric, equally an admirer of Cicero, had failed—the historian Livy. Seneca the elder, a clear-sighted man who could see in Cicero much to praise, and was not blind to the faults of his own age, condemned the old style as lacking in power, while Tacitus, in his *Dialogue on Orators*, includes Cicero among the men of rude and "unkempt" antiquity. The great movement for the poetization of Latin prose which was begun by Sallust ran its course till it culminated in the monstrous style of Fronto. In the courts judges, juries, and audiences alike demanded what was startling, quaint, or epigrammatic, and the speakers practised a thousand tricks to satisfy the demand. Oratory became above all things an art whose last thought was to conceal itself. It is not surprising that Quintilian's forensic efforts won for him no great reputation.

The *Institutio Oratoria* is one long protest against the tastes of the age. Starting with the maxim of Cato the Censor that the orator is "the good man who is skilled in speaking," Quintilian takes his future orator at birth and shows how this goodness of character and skill in speaking may be best produced. No detail of training in infancy, boyhood, or youth is too petty for his attention. The parts of the work which relate to general education are of great interest and importance. Quintilian postulates the widest culture; there is no form of knowledge from which something may not be extracted for his purpose; and he is fully alive to the importance of method in education. He ridicules the fashion of the day, which hurried over preliminary cultivation, and allowed men to grow grey while declaiming in the schools, where nature and reality were forgotten. Yet he develops all the technicalities of rhetoric with a fulness to which we find no parallel in ancient literature. Even in this portion of the work the illustrations are so apposite and the style so dignified and yet sweet that the modern reader, whose initial interest in rhetoric is of necessity faint, is carried along with much

less fatigue than is necessary to master most parts of the rhetorical writings of Aristotle and Cicero. At all times the student feels that he is in the company of a high-toned gentleman who, so far as he could do so without ceasing to be a Roman, has taken up into his nature the best results of ancient culture in all its forms. His literary sympathies are extraordinarily wide. When obliged to condemn, as in the case of Seneca, he bestows generous and even extravagant praise on such merit as he can find. He can cordially admire even Sallust, the true fountain-head of the style which he combats, while he will not suffer Lucilius to lie under the aspersions of Horace. The passages in which Quintilian reviews the literature of Greece and Rome are justly celebrated. The judgments which he passes may be in many instances traditional, but, looking to all the circumstances of the time, it seems remarkable that there should then have lived at Rome a single man who could make them his own and give them expression. The form in which these judgments are rendered is admirable. The gentle justness of the sentiments is accompanied by a curious felicity of phrase. Who can forget "the immortal swiftness of Sallust," or "the milky richness of Livy," or how "Horace soars now and then, and is full of sweetness and grace, and in his varied forms and phrases is most fortunately bold"? Ancient literary criticism perhaps touched its highest point in the hands of Quintilian.

To comprehensive sympathy and clear intellectual vision Quintilian added refined tenderness and freedom from self-assertion. Taking him all in all, we may say that his personality must have been the most attractive of his time—more winning and at the same time more lofty than that of the younger Pliny, his pupil, into whom no small portion of the master's spirit, and even some tincture of the master's literary taste, was instilled. It does not surprise us to hear that Quintilian attributed any success he won as a pleader to his command of pathos, a quality in which his great guide Cicero excelled. In spite of some extravagances of phrase, Quintilian's lament (in his sixth book) for his girl-wife and his boy of great promise is the most pathetic of all the lamentations for bereavement in which Latin literature is so rich. In his precepts about early education Quintilian continually shows his shrinking from cruelty and oppression. The educational method of "Orbilius, abounding in blows," has never been more earnestly rebuked.

Quintilian for the most part avoids passing opinions on the problems of philosophy, religion, and politics. The professed philosopher he disliked almost as much as did Isocrates. He deemed that ethics formed the only valuable part of philosophy and that ethical teaching ought to be in the hands of the rhetoricians. In the divine government of the universe he seems to have had a more than ornamental faith, though he doubted the immortality of the soul. As to politics Quintilian, like others of his time, felt free to eulogize the great anti-Cæsarean leaders of the dying republic, but only because the assumption was universal that the system they had championed was gone for ever. But Quintilian did not trouble himself, as Statius did, to fling stones at the emperors Caligula and Nero, who had missed their deification. He makes no remark, laudatory or otherwise, on the government of any emperor before Domitian. No character figured more largely in the rhetorical controversies of the schools than the ideal despot, but no word ever betrayed a consciousness that the actual occupant of the Palatine might exemplify the themes. Quintilian has often been reproached with his flattery of Domitian. No doubt it was fulsome. But it is confined to two or three passages, not thrust continually upon the reader, as by Statius and

Martial. To refuse the charge of Domitian's expected successors would have been perilous, and equally perilous would it have been to omit from the *Institutio Oratoria* all mention of the emperor. And there was at the time only one dialect in which a man of letters could speak who set any value on his personal safety. There was a choice between extinction and the writing of a few sentences in the loathsome court language, which might serve as an official test of loyalty. So Quintilian, man of honour though he was, swallowed the test as best he might, even as two generations ago in England unbelievers took the sacrament to avoid exclusion from municipal affairs.

The Latin of Quintilian is not always free from the faults of style which he condemns in others. It also exhibits many of the usages and constructions which are characteristic of the silver Latin. But no writer of the decadence departs less widely from the best models of the late republican period. The language is on the whole clear and simple, and varied without resort to rhetorical devices and poetical conceits. Besides the *Institutio Oratoria*, there have come down to us under Quintilian's name 19 longer and 145 shorter *Declamationes*, or school exercises on themes like those in the *Controversiæ* of Seneca. The longer pieces are certainly not Quintilian's. The shorter were probably published, if not by himself, at least from notes taken at his lessons. It is strange that they could ever have been supposed to belong to a later century; the style proclaims them to be of Quintilian's school and time. The works of Quintilian have often been edited. Of the editions of the whole works the chief is that by Burmann (1720); of the *Institutio Oratoria* that by Spalding, completed by Zumpt and Bonnell (1798-1834, the last volume containing a lexicon), and that by Halm (1868). The tenth book of the *Institutio Oratoria* has often been separately edited, as by Krueger, Bonnell, Mayor (unfinished), and others. There is a critical edition of the 145 *Declamationes* by C. Ritter (1885). (J. S. R.)

QUINTUS SMYRNÆUS, a late epic poet of Greece, sometimes called Quintus Calaber because his poem was discovered at Otranto in Calabria. Next to nothing is known of him. He appears to have lived in the latter part of the 4th century, shortly before Nonnus. He speaks of himself as having tended sheep in his youth at Smyrna (bk. xii. 308 sq.). His epic in fourteen books, known as τὰ μετ' Ὀμήρου or the *Posthomericæ*, takes up the tale of Troy at the point where Homer's *Iliad* breaks off, i.e., after the death of Hector, and carries it down to the capture of the city by the Greeks. It describes the doughty deeds and deaths of Penthesilea the Amazon (bk. i.), Memnon, son of the Morning (bk. ii.), and Achilles (bk. iii.); the funeral games in honour of Achilles (bk. iv.); the contest for the arms of Achilles and the death of Ajax (bk. v.); the exploits of Neoptolemus and Deiphobus, the deaths of Paris and Cene, the capture of Troy by means of the wooden horse, the sacrifice of Polyxena at the grave of Achilles, the departure of the Greeks, and their dispersal by the storm (bks. vi.-xiv.). The poet has no originality; in conception and style his work is closely modelled on Homer. His materials are borrowed from the cyclic poems from which Virgil also drew, in particular the *Æthiopis* of Arctinus and the *Little Iliad* of Lesches. The style is clear, but the poem is flat and tedious, in spite of the abundance of similes with which the poet seeks to relieve its dulness.

The first edition of Quintus Smyrnæus was published by Aldus Manutius in 1504 or 1505; in this century there have been editions by Tychsen, 1807, Lehrs in the Didot edition of Hesiod, &c., 1841, and two editions by Köchley in 1850 (Weidmann) and 1853 (Teubner). Sainte-Beuve has an essay on him.

QUITO, the capital of the republic of Ecuador, South America, an archbishopric, and the chief town of a department, lies 14° of latitude south of the equator, and in 79° 45' W. long., at a height of 9520 feet above the sea. In ancient times it was connected with Cuzco by a paved highway, portions of which still exist; but under Spanish rule it was allowed to relapse almost into the natural isolation of its position. Since 1870, however,

two carriage roads have been constructed from Quito to Milagro on the Guayaquil river and to the province of Manabí respectively. The railway projected between the city of Guayaquil and Quito has as yet advanced inland only to Chimbo bridge at the foot of the Andes, so that the really difficult part of the enterprise remains untouched; a telegraph line, however, has been opened. The distance between these two leading cities of the republic is 200 miles by road, and the transit of goods takes fourteen days and costs from 10 to 14 dollars per cargo of 250 lb. Though built on the eastern skirts of the magnificent volcano of Pichincha (15,827 feet) and within 5 miles of its crater, Quito is not within sight of the summit, a secondary eminence known to the Incas as Yavirá, and now as Panecillo, rising between. The site is an irregular plain traversed by two ravines running down from the mountain, one of which is arched over so as not to interfere with the alignment of the streets. Though the streams flow east at first, they really belong to the system of the Peruchó which discharges into the Pacific near Esmeraldas. The houses, mostly of sun-dried brick, are usually low and squat, and not a chimney is to be seen. The public buildings are also of a massive and heavy-looking Spanish type. In the principal square are the cathedral, with a fine marble porch, the Government house, with a colonnade running the whole length of the façade, and the palace of the nuncio. But the finest building in Quito is the college of the Jesuits, part of which is occupied by the university, an institution long rendered interesting to Englishmen by the presence of the venerable botanist Dr William Jameson. There is a public library in the city of 20,000 volumes, and a polytechnic school was instituted in 1872. The local manufactures are confined to coarse cotton and woollen stuffs, thread, lace, hosiery, silk, and a certain amount of jewellery. About 1870 the population was estimated by Dr Jameson at between 30,000 and 40,000; the *Almanach de Gotha* for 1885 states it as 80,000.

Quito (the city of the Quitus, a race akin to the Quichuas of Peru) was peacefully conquered by the Spanish captain Sebastian Benalcázar in 1533. It received the rank of a Spanish city in 1541 from Charles V., and became the capital of the province of Quito in the viceroyalty of New Granada. More than once it has suffered severely from earthquakes: in 1797, for example, 40,000 of its inhabitants were thus destroyed; and in March 22, 1859, property was damaged to the value of \$3,000,000.

QUOITS. This pastime resembles the ancient discus-throwing which formed one of the five games of the Greek pentathlon (see *Discus*, vol. vii. p. 258). The modern quoit, however, is a far lighter missile, and consists of a circular iron ring to be thrown or pitched in play at a fixed object. This ring is flattened, having a thick inner edge and thin outer one. The latter is slightly indented at a given spot to receive the tip of the player's forefinger without cutting it. There is no limit to the weight of a quoit, but this should be specified before commencing a match. The diameter is restricted to 8 inches over all. Two iron pins, called "hobs," are driven into the ground at a certain distance apart, generally 19 yards. There may be one or more players a side, and each has two quoits. These he may throw successively; or else each player throws one only at a time and a second round follows in the same order, as may have been agreed on. The throwing takes place the reverse way after each round. A player grasps the quoit with his forefinger along the outer edge and the tip in the dent, holding the two surfaces between the thumb and the other fingers. In pitching, a slight rotary motion is imparted by the wrist, in order that the quoit may pass smoothly and horizontally through the air, and alight flat. Each player attempts to make his quoit pitch on the hob or pin so that the head of the latter passes

through the circular opening in the centre of the missile. Such a success is termed a "ringer," and two is scored. Quoits of opposite sides alighting equidistant from the pin do not score at all. If a player has both his quoits nearer the pin than any of his opponents he scores two; while if only one be nearer he is entitled to count one to his credit. The game is popular in many country towns and villages of England and in the mining districts of the Midlands and Lancashire. The rules were drawn up as follows in 1869:—

1. That the distance from pin to pin be 19 yards, and that the player stand level with the pin, and deliver his quoit with the first step.
2. That no quoit be allowed which measures more than 8 inches external diameter, but the weight may be unlimited.
3. That the pins be 1 inch above the clay.
4. That all measurements be taken from any visible part of the pin to the nearest visible part of the quoit. No clay or quoit to be disturbed.
5. That no quoit count unless fairly delivered in the clay free from the outer rim, and that no quoit on its back count unless it holds clay or is knocked out by another quoit. That no quoit rolling on the clay count unless it first strikes another quoit or the pin.
6. That each player deliver his quoits in succession, his opponent then following.
7. That an umpire be appointed, and in all cases of dispute his decision be final.

QUO WARRANTO, in English law, is the name given to an ancient prerogative writ calling upon any person usurping any office, franchise, liberty, or privilege belonging to the crown to show "by what warrant" he maintained his claim. It lay also for non-user or misuser of an office, &c. If the crown succeeded, judgment of forfeiture or ouster was given against the defendant. The procedure was regulated by statute as early as 1278 (the statute of *Quo Warranto*, 6 Edw. I. c. 1). After a time the cumbrousness and inconvenience of the ancient practice led to its being superseded by the modern form of an information in the nature of a *quo warranto*, exhibited in the Queen's Bench Division either by the attorney general *ex officio* or by the queen's coroner and attorney at the instance of a private person called the *relator*. The information will not be issued except by leave of the court on proper cause being shown. It does not lie where there has been no user or where the office has determined. Nor does it lie for the usurpation of every kind of office. But it lies where the office is of a public nature and created by statute, even though it is not an encroachment upon the prerogative of the crown. Where the usurpation is of a municipal office the information is regulated by 9 Anne c. 20, under which the defendant may be fined and judgment of ouster given against him, and costs may be granted for or against the relator. Such an information must, in the case of boroughs within the Municipal Corporations Act, 1882, be brought within twelve months after disqualification (45 & 46 Vict. c. 50, § 225); in the case of other boroughs, within six years after the defendant first took upon himself the office (32 Geo. III. c. 58, § 2). The information in the nature of a *quo warranto*, though nominally a criminal, has long been really a civil proceeding, and has recently been expressly declared to be so (47 & 48 Vict. c. 61, § 15). In cases not falling within 9 Anne c. 20, judgment of ouster is not usually given. The most famous historical instance of *quo warranto* was the action taken against the corporation of London by Charles II. in 1684. The Queen's Bench adjudged the charter and franchises of the city of London to be forfeited to the crown (*State Trials*, vol. viii., 1039). This judgment was reversed by 2 Will. & Mary, sess. 1, c. 8; and it was further enacted, in limitation of the prerogative, that the franchises of the city should never be seized or forejudged on pretence of any forfeiture or misdemeanor.

In the United States the right to a public office is tried by *quo warranto* or analogous procedure, regulated by the State laws. Proceedings by *quo warranto* lie in a United States court for the removal of persons holding office contrary to Art. xiv. § 3 of the Amendments to the Constitution, Act of May 31, 1870, c. 14.

R

R was written in Greek originally as P, following the Phœnician form; sometimes, however, a triangle takes the place of the semicircle; not unfrequently also a short stroke appears where we have the lower limb on the right hand; the reason of this addition is not plain: it can hardly have been a diacritical mark to distinguish R from P (as G from C at Rome) because the latter symbol in Greece always kept its two vertical lines (Γ), the curved line (P) appearing first in the Roman alphabet.

The sounds denoted by the same symbol *r* differ considerably. First, there is the true consonantal *r*—our English *r* in *reed*, &c.—produced by raising the tip only of the tongue towards the front palate; the voice escapes by this aperture, the side passages between the tongue and the palate being closed; the mechanism, therefore, is just the opposite to that which produces *l* (see letter L). Secondly, there is the vowel *r*; this is due to the space between the tip of the tongue and the palate being sufficiently great to allow the voice to escape without any friction; the difference between this and consonantal *r* is parallel to that between *u* and *w*, or between *i* and *y*. This vowel-sound, though not heard regularly in any modern language, is not unfrequent in several in certain combinations; for example, it is quite possible to articulate “father” as “fath-*r*,” where the *r* alone forms a syllable and is therefore vocalic. This vowel-sound was a regular sound in Sanskrit, and was probably also heard in the parent language; but in the derived languages (except Sanskrit) it became consonantal *r* with an independent vowel preceding or following; thus a presumed original “*krd*” (=heart), where *r* denotes the vocalic *r*, gave in Sanskrit “*hrd*,” in Greek *κρᾶδ-ῖν*, in Latin “*cor(d)*.” Thirdly, *r* may denote a trill,—that is to say, a sound produced by the vibration of the tongue when laid loosely against the palate and set in motion by a strong current of breath or voice. When the point of the tongue is laid loosely in this way against the palate just behind the gums and made to trill as voice passes over it, we hear the Scotch and the French *r*, each of which is a trill, not a consonantal *r*. The same sound, but unvoiced, is heard in the French “*théâtre*,” &c., and is also the Welsh *rh*. A similar trill at the back part of the palate gives the Northumbrian “*burr*.”

RAAB (Hungarian *Győr*), the capital of a Hungarian province of the same name, lies at the influx of the Raab into a branch of the Danube, 70 miles to the south-east of Vienna. It is a well-built town, with a pleasant promenade laid out on the site of the old fortifications, and is the seat of a Roman Catholic bishop. The cathedral dates from the 12th century, but has recently been modernized; the bishop's palace is an imposing castellated edifice, with dungeons constructed by the Turks. The town possesses several other churches, two of which belong to the Protestants and one to the Greek Church, besides convents, schools, and an academy of jurisprudence. The theatre, on an island formed by the Danube and the Raab, is also a handsome building. The inhabitants, who numbered 20,980 in 1880, manufacture cloth and tobacco and carry on a considerable trade in grain and horses.

Raab occupies the site of the Roman *Arabona*, and by the 10th century had become a place of some importance. In 1594 it fell into the hands of the Turks, who, however, retained possession of it for four years only. In 1809 the forces of the insurgent Hungarian noblesse were easily defeated here by Napoleon's veterans; and the attempts made to maintain the town against the Austrians in 1848-49 were also fruitless. About 10 miles to the south-east of Raab is St Martinsberg, the oldest and wealthiest abbey in Hungary.

RAB, RABBI, RABBĀN, RABBONI, RABBENU, Jewish titles of honour. *Rab* (רב), “lord,” “master,” “teacher,” is the title prefixed to the name of such a Babylonian teacher of the Law or expounder of the Mishnah as, though authorized to “judge” and to decide other religious questions, has not been ordained, or fully ordained, in Palestine.¹ *Rabbi* (רבי, *ῥαββεί*, Matt. xxiii. 7, &c.), “my teacher,” is the title of a teacher fully ordained in Palestine. *Rabbān*, “our teacher” or “our lord,” but also “their,” i.e., all Israel's, teacher (רַבָּן, later form of רַבִּים), was the title of the prince (president of the synedrium) from the time of Gamliel I. (the Gamaliel of St Paul) and onward. If a prince-president sprang from any other house than Hillel's, who was a descendant of David through the female line (as, for example, R. El'azar b. 'Azaryah), he was not called by this highest title of honour. The only exception to this rule was Rabbān Yohanan b. Zakkai, to whom Jewish traditional lore owes so much,—nay, its very existence. For he not merely had a distinguished circle of pupils of his own (*Aboth*, ii. 8, 9), but he saved the lives of the members of the synedrium and secured its free activity. Vespasian, who knew him to have been friendly to the cause of Rome, granted him “Yamnia and its sages” at his request (T. B., *Gittin*, 56b). In Babylonia, again, *Rabbana* (Rabbono) was the title of the Rēsh Gāluthā, or “head of the captivity.” He who bore it was always the reigning descendant of the house of David in the male line. The only person on whom this title was bestowed, though he was not Rēsh Gāluthā, was Rab Ashe (T. B., *Kethuboth*, 22a), the principal editor of the Babylonian Talmud, who is reported to have united in his person riches, learning, and virtues such as no man had possessed since the time of “Rabbi,” the principal editor of the Mishnah (T. B., *Gittin*, 59a).

RAB, when the title is not followed by an individual name, denotes *par excellence* Abbā Arēkhā (Arikha), so called either from the place Arēkhā in Babylonia, or because of his high stature, or his eminence as a man and scholar. Abbā Arēkhā was the most successful teacher of the Law and interpreter of the Mishnah in Babylonia, having brought the latter with him from Palestine, where he had received it orally and directly from Rabbi Yehudah Hannasi; he taught it to more than 1200 pupils, whom he is related to have housed, fed, and clothed (T. B., *Kethuboth*, 106a). He introduced many religious and moral reforms, notably in connexion with marriage, which are law among the Jews of all countries to this day. His Hebrew prose approaches the sublimity of the Old Testament poetry, as may be seen from the tripartite “additional service” recited by all Rabbinic Jews on the two days of the “New Year.” He is also in Babylonia the sole representative of the sublime Palestinian Agadōth, which so closely resemble the words of the Founder of Christianity. In patience with others, and especially with his shrewish wife, he surpassed Job himself. He died as the first head of the academy of Sūrā (somewhat later identified with Māthā Mehasyā) in 247 A.D., more than eighty years old.

RABBI, when the title is not followed by a proper name, denotes *par excellence* Rabbi Yehudah Hannasi, the principal editor of the Mishnah (see vol. xvi. p. 504).

¹ An old pronunciation of this title is *Rūb*, as in Biribbi (בִּירִבִּי), of which the only true explanation is “son of the greatest doctor of the age,” applied to R. Yose b. Halaphta (T. B., *Pesahim*, 100a), R. Shime'on, son of the editor of the Mishnah (*Babā Bathrā*, 16b), and others. Hence the Talmudic explanation of Exod. xxiii. 2, “thou shalt not gainsay a scholar greater than thyself” (T. B., *Synhedrin*, 18b).

The Hellenistic RABBONI (ῥαββοννῆ, John xx. 16) is the Aramaic *ṛabbōnī* used by a slave of his master, a son of his father, a wife of her husband, a worshipper of his God. (Compare the similar variation of the vowel in *pišḥo* = πῖσχα.)

RABBENU signifies "our teacher" *par excellence*, and means in Palestine R. Yehudah Hannasi, and in Babylonia Rab (*i.e.*, Abbā Arēkhā).

Rabbāh (רבב), also Rubbo and Rubboh, a title placed in the Palestinian Talmud and Midrashim after the names of certain teachers (T. Y., *Berakhoth*, i. 1; *Kilayim*, ix. 3, and elsewhere), corresponds to the Hebrew רבב in the same connexion in the Babylonian Talmud (*Berakhoth*, 6a, and elsewhere), and does not, as has hitherto been supposed, mean "the great" but simply "the elder." Thus many questionable Talmudic magnitudes disappear. (S. M. S.-S.)

RABĀ (Rōbō)—*i.e.*, RAB ĀBĀ B. YOSEPH B. HĀMĀ (Hōmō)—was, like his teacher Rabbāh and his fellow-pupil Abayye, a scion of the house of Eli, on whom rested the double curse of poverty and that none of them should reach old age (1 Sam. ii. 31-36). According to T. B., *Rosh Hashshanah*, 18a,¹ he sought to remove this curse, if not by sacrifices and offering then by the study of the Law, while Abayye also practised works of charity. Rābā was rabbi and judge of the congregation and head of the school (*methibṭā*) of Mahūzā. He lived in the middle of the 4th Christian century, and became on the death of his fellow-pupil Abayye head of the famous academy of Pumbedithā, which was only closed in 1040. He was noted, like his predecessor, for his genius; and the discussions between them (and similar ones of others) are known in the Babylonian Talmud as the *Havayoth de-Abayye ve-Rabā* (*Sukkah*, 28a). Rābā was also noted for the liberality of his religious decisions (T. B., *Berakhoth*, 22b; *Pesahim*, 30a, and elsewhere). Being a man of considerable wealth, he showed, in accordance with Scriptural truth (Prov. xviii. 23), his independence in every way. Thus he hesitated not to include the exquisites of the congregation of Mahūzā, who were noted for their luxurious style of living, among the candidates for Gehenna, whose faces would one day become as dark as the sides and the bottom of a saucepan (T. B., *Rosh Hashshanah*, 17a), whilst he most ungalantly applied to their idle wives the passage of Amos iv. 1 (T. B., *Shabbath*, 32b). Rābā was in fact the Abraham a Sancta Clara of his day, minus the cloister life of the latter. He was married to one of the beautiful, accomplished, and amiable daughters of his teacher, R. Hisdā, whom he so dearly loved that he was ready to forgive Bar Hadya (an interpreter of dreams who had much vexed him by his adverse interpretations) everything except the interpretation of a dream foreboding her death. Rābā, relying on Gen. xli. 12, 13, believed that the fulfilment of dreams within certain limits was influenced by the interpretation given to them (T. B., *Berakhoth*, 55b). (S. M. S.-S.)

RABAD (רבבד). Under this abbreviation five Jewish scholars are known, all of whom, singularly enough, lived during the 12th century.

I. RAB AB-BETH-DIN, *i.e.*, the chief rabbi *par excellence*. His real name was R. Abraham b. Yishak of Narbonne. He was the teacher of the most distinguished rabbis of Provence, including his famous son-in-law (Rabad III.) and Rabbenu Zerayah Hallevi, the author of the *Maor*. It has always been known that a great deal of literature on the Talmud belonging to him is mixed up with the works of others, notably with those of Rabad (see III. below).

¹ See *Rashi*, catchword רבב; *Hullin*, 133a, catchwords רבב and רבב. The *Tosaphoth* and printed editions (*ll. cc.*) put RABBĀH (*g.v.*) for Rābā; but *Rashi's* traditional reading (רבב) must be right. For, in the first place, it would have been on the part of the Talmud superfluous to state that Rabbāh and Abayye were of the house of Eli, seeing that the latter was the son of the brother of the former. And secondly, the story goes (*Rosh Hashshanah*, l. c.) that he who only studied the Law died at the age of forty (Abayye living to sixty), whereas the synchronisms of Rabbāh's life show that he must have lived to a much greater age.

In 1867-69, however, Dr B. H. Auerbach, rabbi of Halberstadt, edited for the first time Rabad's chief work, *The Eshkol*, in three parts, 4to.

II. R. ABRAHAM B. DAVID (Dāūd, דוד) HALLEVI of Toledo, the historiographer, who suffered martyrdom in 1180. His chief work has been printed innumerable times, and repeatedly with historical additions from earlier sources. Some of the parts of this "Tradition" and of these additions have been translated into Latin,

English, and German. (1) His historical work, ספר הקבלה, is a chronicle down to 1161, preceded by Seder 'Olam and Megillath Ta'anith (Mantua, 1513, 4to); cheap editions are to be got in Poland. (2) His philosophico-theological work (composed in Arabic, translated into Hebrew by R. Shelomoh Ibn Labi—14th century—and into German by Weil) came out at Frankfurt in 1852, 8vo.

III. R. ABRAHAM B. DAVID, disciple and son-in-law of Rabal I. This is the "great Rabbi of Posquière," the only opponent whom Maimonides thought a match for himself. He died in 1198. His works are:—(1) Commentary on the Mishnic treatise *'Eduyyoth* (see *MISHNAH*, vol. xvi. p. 506), which accompanies some early and all later editions of the Babylonian Talmud (that on *Tamid*, ascribed to him, is not his). (2) Commentary on *Siphro* (see vol. xvi. p. 507). (3) Much of *Tenim De'im*, part of the collection *Tummath Yesharim*, on various Rabbinic matters; Venice, 1622, fol. (4) *Be'ale Hannephesh*, on laws relating to women (first independent edition, Prague, 1811, 4to). (5) *Hassagoth*, or Strictures on the *Mishneh Torah* of MAIMONIDES (*g.v.*). These accompany most early and all later editions of the *Mishneh Torah*.

IV. R. ABRAHAM B. DAVID, author of the commentary on the *Sepher Yesirah*.² His commentary has been printed innumerable times with the work itself, the *editio princeps* at Mantua in 1562, 4to. Part of its preface was done in Latin by Rittangelius (Amsterdam, 1642, 4to).

V. R. ABRAHAM B. DAVID. He wrote Strictures (*Hassagoth*) on Rashi on the Pentateuch. This little and most interesting book was either written by a Sepharadi or Provençal, and lies in MS. (Add., 377, 3, 1) in the Cambridge University Library. No other copy is known. (S. M. S.-S.)

RABĀN (רבבן)—*i.e.*, RABBENU ELI'EZER B. NATHAN of Mainz—was one of the most famous Halakhic teachers of the 12th century. He lived at Mainz and corresponded with Rashi's son-in-law, Rabbenu Meir b. Shemuel, and his three distinguished sons, RASHBAM (*g.v.*), Ribam (R. Yishak b. Meir, who died young and left seven orphans), and Rabbenu Tham (R. Ya'akov). His great Halakhic work, רבבן נפת, or רבבן העזר, is commonly called by the combination of the author's initials which heads this article, the Book of Rābān, and was printed at Prague in 1610 fol.³ Other Halakhic literature by him is to be found in *Kol Bo*, § 123 (without place or date, but probably Naples, towards the end of the 15th century), and its reprints. More lies in MS. in libraries; thus the *Eben Haroshah*, of which no other copy is known, is preserved in the Cambridge University Library (Add., 498). R. Eli'ezer was also a fine liturgical poet, vying both in sentiment and elegance with the poets of the Sepharadic school, as appears, for example, from the Ophan and other pieces designed for a Sabbath when there is a circumcision. Rabbenu Eli'ezer died in the 12th century. The date 5007 (= 1247) which appears in the formulas of a bill of divorce and a deed of manumission of a slave is most assuredly due to a scribe of the 13th century, who in transcribing Rābān's book conformed the date to his own time—a practice often to be met with.

Dr A. Jellinek of Vienna has published a *History of the First Crusade* (קונטרס נזירות תתתי, Leipzig, 1854, 8vo)—a little book interesting in more than one way—which bears the name of Rābān. It cannot, however, be by the subject of this article, as one can see by comparing with his genuine work the questionable poetic stuff which forms part of the *Konteres*. The author is no doubt Rābān of Cologne. Nor does the commentary on אלהים אל (for Pentecost eve) under the title of מאמר השכל, which has been often printed, and of which the Cambridge Library has an old MS. (Add., 493, 1),

² The idea that R. Yoseph Arukh—Μαρκός (a Greek) or Longus (a Roman)—was the author of this commentary must be given up. On the other hand, it is not quite impossible that this commentator and the writer of the Strictures on Rashi are one and the same person.

³ The thanks of the writer of these lines are due to the curators and librarian of the Bodleian for the loan of this book.

belong to this Rābān, though it has been ascribed to him for 600 years. Its writer was undoubtedly a Provençal. (S. M. S.-S.)

RABANUS MAURUS. See **HABANUS MAURUS.**

RABÁT (RIBÁT), RBÁT, or ARBÁT, also known as **NEW SALLEE**, a city of Morocco, on the coast of the Atlantic, 130 miles south of Cape Spartel at the mouth of the **Bú Raḡraḡ**, which separates it from Sallee proper on the northern bank. It is a commercial town of about 26,000 to 30,000 inhabitants, occupying a rocky plateau and surrounded by massive but dilapidated walls, strengthened by three forts on the seaward side. The old citadel, overhanging the mouth of the river, is still, though partially in ruins, an imposing building, with huge arched gateways, square towers, and masses of rich red-brown masonry; and to the south of the town lies a modern palace defended by earthworks after the European fashion. The conspicuous feature in the view from the sea is the **Hasan tower**, a beautiful square-built minaret 180 feet high, which stands at an elevation of about 65 feet above the sea to the west of the walled town, and in the midst of gardens and orchards whose vegetation partly hides the ruined columns of the ancient mosque to which it was attached. It is constructed of soft reddish-brown stone, and each side is adorned with a different design. At one time the **Bú Raḡraḡ** afforded a much better harbour than it does now: the roadstead is quite unprotected, and there is a dangerous bar at the mouth of the river. Rabát trades with Fez and the interior of Morocco, with the neighbouring coast-towns and Gibraltar, and with Marseilles, Manchester, and London. The principal articles of export are wool, hides, and wax, and the products of that local manufacture of leather, carpets, mats, woollen and cotton stuffs, pottery, and circular brass trays which makes Rabát the greatest industrial centre in Morocco. Cotton goods and loaf-sugar are first among the imports. The average value of the exports in the ten years 1872 to 1881 was £47,236, and of the imports £73,945. In 1883 the figures were £39,596 and £50,222 respectively.

Sallee (Salá), on the north side of the river, is also enclosed with walls. Much of the interior, however, is vacant and the houses are mean; and, unlike their neighbours of Rabát, the inhabitants (about 30,000) down to quite recent times distinguished themselves by particular hostility to Christians, who were thus prevented from entering their gates. To the north a ruined aqueduct extends for miles.

Rabát was founded by Yak'úb al-Mansûr (ob. 1306); but Sallee was then an ancient city, and on the scarped hills to the west of Rabát stand the ruins of Sala, a Roman colony. Shella, as the place is now called, was the seat of the mausoleum of the Bení-Merín dynasty.

RABBA, a town of Nupi or Nufi, on the bank of the Kworra (Niger), opposite the island of Zagozhi, in 9° 6' N. lat., and 200 miles above the confluence of the Kworra and the Binue. At the time of Lander's visit in 1830 it was a place of 40,000 inhabitants and one of the most important markets in the country. In 1851 Dr Barth reported it "in ruins," and in 1867 Rohlf's found it with only 500 inhabitants. A mission station, established there in 1857 by the Church Missionary Society, was afterwards withdrawn. The town has latterly somewhat recovered its position.

RABBĀH—i.e., **RAB ABBĀH BAR NAḤMANI**—was of the house of Eli, on whom the curse rested that none of them should reach a high age (1 Sam. ii. 33). Like Rābā, he tried to remove this curse (T. B., *Rosh Hashanah*, 18a; see **RĀBĀ**). He was twenty-two years head of the academy of Pumbadithā, from which he fled in the year 330, pursued by a troop of the Persian king (Shāpūr II.), and perished miserably in a jungle (T. B., *Bobo Mets'io*, leaf 86a).

Rabbāh, owing to his great dialectic powers, to which no difficulty seemed difficult, was called 'Oker Harim, "uprooter of mountains."¹ This title was applied to him when the selection as "head" lay between him and his friend, fellow-pupil, and successor, Rab Yoseph, "the Blind," to whom is commonly, but by mistake, ascribed the authorship of certain Targumim. This latter doctor was, owing to his vast but mere reproductive powers, called Sinai, the mountain from which the letter of the Law was given (T. B., *Berachoth*, 64a). (S. M. S.-S.)

RABBI. See **RAB.**

RABBIT. This animal, one of the best known and most frequently seen of all wild British mammals, is, with the hare, a member of the Rodent genus *Lepus*, which contains about twenty-five other species spread over the greater part of the world, and whose more important characters have already been referred to (see **HARE**, vol. xi. p. 476, and **MAMMALIA**, vol. xv. p. 421).

The rabbit (*Lepus cuniculus*), speaking for the present of the wild race only, is distinguished from the hare externally by its smaller size, shorter ears and feet, by the absence or reduction of the black patch at the tip of the ears so characteristic of the hare, and by its greyer colour. The skull is very similar to that of the hare (see **MAMMALIA**, fig. 99), but is smaller and lighter, and has a slenderer muzzle and a longer and narrower palate. Besides these characters, however, the rabbit is sharply

Rabbit.

separated from the hare by the fact that it brings forth its young naked, blind, and helpless; to compensate for this, it digs a deep burrow in the earth in which they are born and reared, while the young of the hare are born fully clothed with fur, and able to take care of themselves in the mere shallow depression or "form" in which they are born. The weight of the rabbit is from 2½ to 3 lb, although individuals perfectly wild have been recorded up to more than 5. Its general habits are too well known to need a detailed description here. It breeds from four to eight times a year, bringing forth each time from three to eight young. Its period of gestation is about thirty days, and it is able to bear when six months old. It attains to an age of about seven or eight years.

The geographical distribution of the rabbit presents many most interesting peculiarities. It is believed to be originally a native of the western half of the Mediterranean basin only, and still abounds in Spain, Sardinia, southern Italy and Sicily, Greece, Tunis, and Algeria; and many of the islands adjoining these countries are quite overrun with it. Thence it has spread, partly by man's agency, northwards throughout temperate western Europe, increasing rapidly wherever it gains a footing; and this extension is still going on, as is shown by the

¹ See for a similar expression Matt. vii. 20.

case of Scotland, in which sixty years ago rabbits were little known, while they are now found in all suitable localities up to the extreme north. It has also gained admittance into Ireland, and now abounds there as much as in England. Out of Europe the same extension of range has been going on. In New Zealand and Australia rabbits, introduced either for profit or sport, have increased to such an extent as to form one of the most serious pests that the farmers have to contend against, as the climate and soil seem to suit them perfectly and their natural enemies are too few and too lowly organized to keep their numbers within reasonable bounds. In other cases rabbits introduced into islands have become or remained more or less distinct from their parent stock; thus the rabbits both of the Falkland Islands and of Jamaica still show traces of their descent from domesticated varieties, and have never reverted to the ordinary brownish-grey type. And again, as was pointed out by Mr Darwin,¹ the rabbits in the island of Porto Santo, near Madeira, whose ancestors were introduced from Spain in 1418 or 1419, have formed quite a distinct diminutive race, barely half the bulk or weight of English rabbits, and differing in certain slight details of colour and habits.

The rabbit has been domesticated by man from a very early period. No doubt exists amongst naturalists that all the varieties of the domestic animal are descended from the *Lepus cuniculus*. The variations which have been perpetuated and intensified by artificial selection are, with the exception of those of the dog, greater than have been induced in any other species of mammal. For not only has the weight been more than quadrupled in some of the larger breeds, and the structure of the skull and other parts of the skeleton greatly altered, but the proportionate size of the brain has been considerably reduced and the colour and texture of the fur altered in the most remarkable manner. The establishment of these extreme variations is dependent on the highly artificial conditions under which the animals are kept, their great prolificacy, and the rapidity with which the generations succeed each other, which enable the process of artificial selection by the preservation of those most suited to the purposes of the breeder to be carried into effect with facility.

The *Lop-eared* breed is the oldest English fancy variety; it has been cultivated carefully for about a century, the aim of the breeder being chiefly directed to the development of the size of the ears, and with such success that they sometimes measure more than 23 inches from tip to tip and exceed 6 inches in width. This development, which is accompanied by great changes in the structure of the skull, that have been carefully described by Darwin in his *Variation of Animals, &c.*, depends on breeding the animals in warm damp hutches, without which the best developed parents fail to produce the desired offspring. In colour the lop-eared rabbits vary greatly.

The *Belgian hare* is a large variety of a hardy and prolific character, which closely resembles the common hare in colour, and is not unlike it in form. Some few years since many of these animals were sold as leporides or hybrids, produced by the union of the hare and the rabbit; but the most careful experimenters have failed to obtain any such hybrid, and the naked immature condition in which young rabbits are born as compared with the clothed and highly developed young hares renders it exceedingly unlikely that hybrids could be produced. Nor does the flesh of the Belgian rabbit resemble that of the hare in colour or flavour. A closely allied variety, though of even larger size, is known by the absurd name of *Patagonian* rabbit; it has no relation to the country after which it is called.

The *Angora* rabbit is characterized by the extreme elongation and fineness of the fur, which in good specimens reaches 6 or 7 inches in length, requiring great care and frequent combing to prevent it from becoming matted. The Angoras most valued are albinos, with pure white fur and pink eyes; in some parts of the Continent they are kept by the peasants and clipped regularly.

Amongst the breeds which are valued for the distribution of colour on the fur are the *Himalayan* and the *Dutch*. The former is white, but the whole of the extremities—viz., the nose, the ears, tail, and feet—are black or very dark in colour. This very pretty breed has no connexion with the mountain chain from whence it has taken its name, but is a variety produced by careful breeding and selection as fully described by Darwin (*op. cit.*). Though but recently produced by crossing, it now generally breeds true to colour, at times throwing back, however, to the silver greys from which it was derived. The rabbits known in Great Britain as Dutch are of small size, and are valued for the disposition of the colour and

markings. The entire body behind the shoulder-blades is uniformly coloured, with the exception of the feet; the anterior part of the body, including the fore legs, neck, and jaws, is white, the cheeks and ears being coloured. In some strains the coloured portion extends in front of the fore legs, leaving only a ring of white round the neck. The more accurately the coloured portion is defined the higher is the animal esteemed.

The *Silver grey* is a uniform coloured variety, the fur of which is a rich chinchilla grey, varying in depth of colour in the different strains. From the greater value of the fur silver greys have been frequently employed to stock warrens, as they breed true to colour in the open if the ordinary wild rabbits are rigorously excluded. Other colours known, as *Silver cream* and *Silver brown*, are closely allied varieties.

As an article of food the domesticated rabbit is of considerable importance. From 100 to 200 tons are imported into London from Ostend every week during the colder months of the year, having been reared in hutches by the Belgian peasants. They are forwarded without their skins, which are half the value of the flesh. A plan has been recently devised by Major Morant, which is known as "hutch-farming in the open." The animals are kept in large hutches with projecting roofs, floored with coarse galvanized iron netting, through which the grass projects to be eaten by the rabbits. The hutches are shifted twice or thrice a day, so that the animals are constantly on clean ground and have fresh food. The young, when old enough to leave the mother, are reared in somewhat larger hutches of a similar description and killed for market under three months of age.

RABELAIS, FRANÇOIS (c. 1490-1553), the greatest of French humourists and one of the few great humourists of the world, was born at Chinon on the Vienne in the province of Touraine. The date of his birth is wholly uncertain: it has been put by tradition and by authorities long subsequent to his death as 1483, 1490, and 1495. There is nothing in the positive facts of his life which would not suit tolerably well with any of these dates; most 17th-century authorities give the earliest, and this also accords best with the age of the eldest of the Du Bellay brothers, with whom Rabelais was at school. In favour of the latest it is urged that if Rabelais was born in 1483 he must have been forty-seven when he entered at Montpellier, and proportionately and unexpectedly old at other known periods of his life. In favour of the middle date, which has, as far as recent authorities are concerned, the weight of consent in its favour, the testimony of Guy Patin, a witness of some merit and not too far removed in point of time, is invoked, though perhaps the fact of its being a *via media* has really had most to do with the adoption. The only contribution which need be made here to the controversy is to point out that if Rabelais was born in 1483 he must have been an old man when he died, and that scarcely even tradition speaks of him as such. And since this tradition is mentioned it may as well be observed at once that all the anecdotes of Rabelais without exception, and most of the accounts of the facts of his life, date from a period long posterior to his death and are utterly unworthy of credence. Colletet nearly a hundred years later, Antoine Leroy a full hundred, and Bernier nearly a hundred and fifty collected or invented stories which, as far as any actual authority goes, must be regarded as worthless. Bishop Huet's researches were made nearly as late as Bernier's. Throughout this article, therefore, when tradition or any similar word is used without further precision it will be understood that the statements have in themselves only conjectural validity.

With regard to his birth, parentage, youth, and education everything depends upon tradition, and it is not until he was according to one extreme hypothesis thirty-six, according to the other extreme twenty-four, that we have solid testimony respecting him. In the year 1519, on the 5th of April, the François Rabelais of history emerges. The monks of Fontenay le Comte bought some property (half an inn in the town), and among their signatures to the deed of purchase is that of François Rabelais. Before this all is cloudland. It is said that he had four brothers

¹ *Variation of Animals and Plants*, 2d ed., i. p. 119.

and no sisters, that his father had a country property called La Devinière, and was either an apothecary or a tavern-keeper. Half a century after his death De Thou mentions that the house in which he was born had become a tavern. It still stands at the corner of a street called the Rue de la Lamproie, and the tradition may be correct. An indistinct allusion of his own has been taken to mean that he was tonsured in childhood at seven or nine years old; and tradition says that he was sent to the convent of Seuilly, though of course he could then have taken no definite vows, and there is no evidence whatever that the passage in question, which simply condemns the practice referred to, has any personal reference. From Seuilly at an unknown date tradition takes him either to the university of Angers or to the convent school of La Baumette or La Basmette, founded by good King René in the neighbourhood of the Angevin capital. Here he is supposed to have been at school with the brothers Du Bellay, with Geoffroy d'Estissac and others. The next stage in this (as far as evidence goes, purely imaginary) career is the monastery of Fontenay le Comte, where, as has been seen, he is certainly found in 1519 holding a position sufficiently senior to sign deeds for the community, where he, as will be seen, certainly, though at an unknown date, took priest's orders, and where he also pursued, again certainly, the study of letters, and especially of Greek, with ardour. From this date, therefore, he becomes historically visible. The next certain intelligence which we have of Rabelais is somewhat more directly biographical than this bare entry of his name. The letters of the well-known Greek scholar Budæus, two of which are addressed to Rabelais himself and several more to his friend and fellow-monk Pierre Amy, together with some notices by André Tiraqueau, a learned jurist, to whom Rabelais rather than his own learning has secured immortality, show beyond doubt what manner of life the future author of *Gargantua* led in his convent. These letters are partly written in Greek and partly in Latin. In Tiraqueau's book *De Legibus Connubialibus*, which excited a controversy with another jurist of the west, Bouchard, also a friend of Rabelais, the latter is described as "a man most learned in both languages and all kinds of scholarship above his age, and beyond the wont and, if I may say so, the excessive scrupulousness of his order." The excessive scrupulousness of the order showed itself before long in reference to Amy and Rabelais, the latter of whom had, as this sentence of Tiraqueau's also informs us, translated the first book of Herodotus. The letters of Budæus show that an attempt was made by the heads of the convent or the order to check the studious ardour of these Franciscans; but it failed, and there is no positive evidence of anything like actual persecution, the phrases in the letters of Budæus being merely the usual exaggerated Ciceronianism of the Renaissance. Some books and papers were seized as suspicious, then given back as innocent; but Rabelais was in all probability disgusted with the cloister,—indeed his great work shows this beyond doubt. In 1524, the year of the publication of Tiraqueau's book above cited, his friend Geoffroy d'Estissac procured from Clement VII. an indult, licensing a change of order and of abode for Rabelais. From a Franciscan he became a Benedictine, and from Fontenay he moved to Maillezaïs, of which Geoffroy d'Estissac was bishop. He seems indeed to have been constantly in the company of the bishop and to have made many new literary acquaintances, notably Jean Bouchet, the poet. To him he wrote an epistle in French verse, still extant, which proves that Rabelais, much more truly than Swift, never could have been a poet. The title of this epistle is, however, noteworthy, inasmuch as the author is described in the original (a collection of Bouchet's works

published in 1545) as a man of great literary knowledge in Greek and Latin, and as a great orator in Greek, Latin, and French. But even this learned and hospitable retreat did not apparently satisfy Rabelais. In or before 1530 he left Maillezaïs, abandoned his Benedictine garb for that of a secular priest, and, as he himself puts it in his subsequent *Supplicatio pro Apostasia* to Pope Paul III., "per seculum diu vagatus fuit." He is met at Montpellier in the year just mentioned. He entered the faculty of medicine there on the 16th of September and became bachelor on the 1st of November, a remarkably short interval, which shows what was thought of his acquirements. Early in 1531 he lectured publicly on Galen and Hippocrates, while his more serious pursuits seem to have been chequered by acting in a *morale comédie*, then a very frequent university amusement. Visits to the îles d'Hières, and the composition of a fish sauce in imitation of the ancient *garum*, which he sent to his friend Dolet, are associated, not very certainly, with his stay at Montpellier, which, lasting rather more than a year at first, was renewed at intervals for several years.

In 1532, however, and probably rather early than late in that year, he had moved from Montpellier to Lyons. Here he plunged into manifold work, literary and professional. He was appointed before the beginning of November physician to the hôtel dieu, with a salary of forty livres per annum. He edited for Sebastian Gryphius, in the single year 1532, the medical *Epistles* of Giovanni Manardi, the *Aphorisms* of Hippocrates, with the *Ars Parva* of Galen, and an edition of two supposed Latin documents, which, however, happened unluckily to be forgeries. These three works were dedicated in order to his three chief friends of Touraine and Poitou, André Tiraqueau, the bishop of Maillezaïs, and Bouchard. We also have a Latin letter written on 1st December 1532 to a certain Bernard de Salignac, otherwise unknown.

It is certain that at this time Lyons was the centre and to a great extent the headquarters of an unusually enlightened society, and indirectly it is clear that Rabelais became intimate with this society. A manuscript distich, which was found in the Toulouse library, on the death of an infant named Theodule, whose country was Lyons and his father Rabelais, would seem to show that he here entered into other connexions than those of friendship. Absolutely nothing, however, is known about the child and its mother; it is enough to say that the existence of the former would have been by the manners and morals of the time very easily condoned. But what makes the Lyons sojourn of the greatest real importance is that at this time probably appeared the beginnings of the work which was to make Rabelais immortal. It is necessary to say "probably," because the strange uncertainty which rests on so much of his life and writings exists here also. There is no doubt that both *Gargantua* and *Pantagruel* were popular names of giants in the Middle Ages, though, curiously enough, no mention of the former in French literature much before Rabelais's time has been traced. In 1526, however, Charles de Bordigné, in a satiric work of no great merit, entitled *La Légende de Pierre l'aiseu*, has the name *Gargantua* with an allusion, and in 1532 (if not earlier) there appeared at Lyons *Les Grandes et Inestimables Chroniques du Grand et Enorme Géant Gargantua*. This is a short book on the plan of the later burlesques and romances of the Round Table. Arthur and Merlin appear with Grantgosier, as he is here spelt, Galemelle (*Gargalelle*), *Gargantua* himself, and the terrible mare. But there is no trace of the action or other characters of *Gargantua* that was to be, nor is the manner of the piece in the least worthy of Rabelais. No one supposes that he wrote it, though it has been supposed that he edited it and that in

reality it is older than 1532, and may be the direct subject of Bordigné's allusion six years earlier. What does, however, seem probable is that the first book of *Pantagruel* (the second of the whole work) was composed with a definite view to this chap book and not to the existing first book of *Gargantua*, which was written afterwards when Rabelais discovered the popularity of his work and felt that it ought to have some worthier starting-point than the *Grandes Chroniques*. The earliest known and dated edition of *Pantagruel* is of 1533, of *Gargantua* 1535, though this would not be of itself conclusive, especially as we actually possess editions of both which, though undated, seem to be earlier. But the definite description of *Gargantua* in the title as "Père de Pantagruel," the omission of the words "second livre" in the title of the first book of *Pantagruel* while the second and third are duly entitled "tiers" and "quart," the remarkable fact that one of the most important personages, Friar John, is absent from book ii., the first of *Pantagruel*, though he appears in book i. (*Gargantua*), and many other proofs show the order of publication clearly enough. There is also in existence a letter of Calvin, dated 1533, in which he speaks of *Pantagruel*, but not of *Gargantua*, as having been condemned as an obscene book. Besides this, 1533 saw the publication of an almanac, the first of a long series which exists only in titles and fragments, and of the amusing *Prognostication Pantagrueline* (still, be it observed, *Pantagrueline*, not *Gargantuine*). Both this and *Pantagruel* itself were published under the anagrammatic pseudonym of "Alcofribas Nasier," shortened to the first word only in the case of the *Prognostication*.

This busy and interesting period of Rabelais's life was brought to a close apparently by his introduction or reintroduction to Jean du Bellay. They had been, it has been said, schoolfellows, but Bellay does not appear among the list of Rabelais's friends in the first years of his emancipation. From 1534, however, he and the other members of his family appear as Rabelais's chief and constant patrons during the remainder of his life. It was just before Christmas that Jean du Bellay, passing through Lyons on an embassy to Rome, engaged Rabelais as physician. The visit did not last very long, but it left literary results in an edition of a description of Rome by Marliani, which Rabelais published in September 1534. It is also thought that the first edition of *Gargantua* may have appeared this year.

In the spring of 1535 the authorities of the Lyons hospital, considering that Rabelais had twice absented himself without leave, elected Pierre de Castel in his room; but the documents which exist do not seem to infer that any blame was thought due to him, and the appointment of his successor was once definitely postponed in case he should return. An epigram of Dolet shows that at least once and probably about this time he performed a public dissection. At the end of 1535 Rabelais once more accompanied Jean du Bellay, now a cardinal, to Rome and stayed there till April in the next year. This stay furnishes some biographical documents of importance in the shape of letters to Geoffroy d'Estissac, of the already-mentioned *Supplicatio pro Apostasia*, and of the bull of absolution which was the reply to it. This bull not only freed Rabelais from ecclesiastical censure but gave him the right to return to the order of St Benedict when he chose, and to practise medicine. He took advantage of this bull and became a canon of St Maur. The monastery having but recently become collegiate, there seems to have been some technical difficulty which necessitated a new supplication. In the next year (1537) we find Rabelais present at a dinner where the friends of Étienne Dolet met to congratulate him on his pardon for the homicide of

Compaing. The luckless printer has left a poem on the occasion, and two other writers, Salmon Macrin and Nicholas Bourbon, have also left poems of this date expressing the regard in which Rabelais was generally held. Now, too, he took his doctor's degree at Montpellier, lectured on the Greek text of Hippocrates, and next year made a public anatomical demonstration. During these two years he seems to have resided either at Montpellier or at Lyons. But in 1539 he entered the service of Guillaume du Bellay-Langey, elder brother of Jean, and would appear to have been with him (he was governor of Piedmont) till his death on 9th January 1543. Rabelais wrote a panegyric memoir of Guillaume, which is lost, and the year before saw the publication of an edition of *Gargantua* and *Pantagruel*, book i., together (both had been repeatedly reprinted separately), in which some dangerous expressions were cut away. Nothing at all is known of his life, whereabouts, or occupations till the publication of the third book, which appeared in 1546, "avec privilège du roi," which had been given in September 1545.

Up to this time Rabelais, despite the condemnation of the Sorbonne referred to above, had experienced nothing like persecution or difficulty. Even the spiteful or treacherous act of Dolet, who in 1542 reprinted the earlier form of the books which Rabelais had just slightly modified, seems to have done him no harm. But the storm of persecution which towards the end of the reign of Francis I. was fatal to Dolet himself and to Despériers, while it exiled and virtually killed Marot, did not leave Rabelais scatheless. There is no positive evidence of any measures taken or threatened against him; but it is certain that he passed nearly the whole of 1546 and part of 1547 at Metz in Lorraine as physician to the town at the salary of 120 livres, that Sturm speaks of him as having been "cast out of France by the times" (with the exclamation *φεύ τῶν χρόνων*) in a contemporary letter, and that he himself in a letter, also contemporary, though it is not clear whether it is of 1546 or the next year, gives a doleful account of his pecuniary affairs and asks for assistance. At Francis's death on 31st March 1547 Du Bellay went to Rome, and at some time not certain Rabelais joined him. He was certainly there in February 1549, when he dates from Du Bellay's palace a little account of the festivals given at Rome to celebrate the birth of the second son of Henry II. and Catherine de' Medici. This account, the *Sciomachie* as it is called, is extant. In the same year a monk of Fontevault, Gabriel du Puits-Herbault, made in a book called *Theotimus* the first of the many attacks on Rabelais. It is, however, as vague as it is violent, and it does not seem to have had any effect. Rabelais had indeed again made for himself protectors whom no clerical or Sorbonist jealousy could touch. The *Sciomachie* was written to the cardinal of Guise, whose family were all-powerful at court, and Rabelais dedicated his next book to Odet de Chatillon, afterwards cardinal, a man of great influence. Thus Rabelais was able to return to France, and was presented to the livings of Meudon and St Christophe de Jambet. It may, however, surprise those who have been accustomed to hear him spoken of as "curé de Meudon" and who have read lives of him founded on legend to find that there is very little ground for believing that he ever officiated or resided there. He certainly held the living but two years, resigning it in January 1552 along with his other benefice, and it is noteworthy that at the episcopal visitation of 1551 he was not present. To this supposed residence at Meudon and to the previous stay at Rome, however, are attached two of the most mischievous items of the legend, though fortunately two of the most easily refutable. It is said that Rabelais met and quarrelled with Joachim du Bellay the

poet at Rome, and with Ronsard at Meudon and elsewhere, that this caused a breach between him and the Pléiade, that he satirized its classicizing tendencies in the episode of the Limousin scholar, and that Ronsard after his death avenged himself by a libellous epitaph. The facts are these. Nothing is heard of the quarrel with Du Bellay or of any meeting with him, nothing of the meetings and bickerings with Ronsard, till 1699, when Bernier tells the story without any authority. The supposed allusions to the Pléiade date from a time when Ronsard was a small boy, and are mainly borrowed from an earlier writer still, Geoffroy Tory. Lastly, the epitaph read impartially is not libellous at all but simply takes up the vein of the opening scenes of *Gargantua* in reference to Gargantua's author. There is indeed no reason to suppose that either Ronsard or Du Bellay was a fervent admirer of Rabelais, for they belonged to a very different literary school; but there is absolutely no evidence of any enmity between them or even of any acquaintanceship which could have given rise to enmity.

Some chapters of Rabelais's fourth book had been published in 1548, but the whole did not appear till 1552. The Sorbonne censured it and the parliament suspended the sale, taking advantage of the king's absence from Paris. But it was soon relieved of the suspension. This is the last fact we know about Rabelais. It is supposed that he died in 1553, but actual history is quite silent, and the legends about his deathbed utterances—"La farce est jouée," "Je vais chercher un grand peut-être," &c.—are altogether apocryphal. The same may be said of the numerous silly stories told of his life, such as that of his procuring a free passage to Paris by inscribing packets "Poison for the king," and so forth.

Ten years after the publication of the fourth book and nine after the supposed date of the author's death there appeared at Lyons sixteen chapters entitled *L'Île Sonnante par Maître François Rabelais*, and two years later the entire fifth book was printed as such. In 1567 it took place with the others, and has ever since appeared with them. But from the beginning of the 17th century there have never been wanting disbelievers in its authenticity. The controversy is one of some intricacy, but as it is also one of capital importance in literary history the heads of it at least must be given here. The opponents of the book rely (1) on the testimony of a certain Louis Guyon, who in 1604 declared that the fifth book was made long after Rabelais's death by an author whom he knew, and who was not a doctor, and on the assertion of the bibliographer Du Verdier, about the same time, that it was written by an "écolier de Valence"; (2) on the fact that the anti-monastic and even anti-Catholic polemic is much more accentuated in it; (3) that parts are apparently replicas or rough drafts of passages already appearing in the four earlier books; (4) that some allusions are manifestly posterior to even the farthest date which can be assigned for the reputed author's decease. On the other hand, it is urged that, though Guyon and Du Verdier were in a sense contemporaries, they wrote long after the events, and that the testimony of the former is vitiated, not merely by its extreme vagueness but by the fact that it occurs in a *plaidoyer*, tending to exculpate physicians from the charge of unorthodoxy; that Du Verdier in another place assigns the *Pantagrueline Prognostication* to this same unknown student of Valence, and had therefore probably confused and hearsay notions on the subject; that the rasher and fiercer tone, as well as the apparent repetitions, are sufficiently accounted for on the supposition that Rabelais never finally revised the book, which indeed dates show that he could not have done, as the fourth was not finally settled till just before his death;

and that it is perfectly probable, and indeed almost certain, that it was prepared from his papers by another hand, which is responsible for the anachronous allusions above referred to. But the strongest argument, and one which has never been attacked by authorities really competent to judge, is that the "griffe de l'aigle" is on the book, and that no known author of the time except Rabelais was capable of writing the passage about the *Chats fourrés*, the better part of the history of Queen Whims (*La Quinte*) and her court, and the conclusion giving the Oracle of the Bottle. To this argument we believe that the more competent a critic is, both by general faculty of appreciation and by acquaintance with contemporary French literature, the more positive will be the assent that he yields.

Gargantua and *Pantagruel*, notwithstanding their high literary standing and the frequency with which certain passages from them are cited, are, owing partly to their archaism of language and partly to the extreme licence which their author has allowed himself, so little read that no notice of them or of him could be complete without some sketch of their contents. The first book, *Gargantua*, describes the birth of that hero (a giant and the son of gigantic parents), whose nativity is ushered in by the account of a tremendous feast. In this the burlesque exaggeration of the pleasures of eating and drinking, which is one of the chief exterior notes of the whole work, is pushed to an extreme,—an extreme which has attracted natural but perhaps undue attention. Very early, however, the author becomes serious in contrasting the early education of his hero—a satire on the degraded schools of the Middle Ages—with its subsequent and reformed stage, in the account of which all the best and noblest ideas of the humanist Renaissance in reference to pedagogy are put with exceptional force. *Gargantua* is recalled from Paris, whither he had been sent to finish his education, owing to a war between his father, Grandcosier, and the neighbouring king, Picrochole. This war is described at great length, the chief hero of it being the monk, Friar John, a very unclerical cleric, in whom Rabelais greatly delights. Picrochole defeated and peace made, *Gargantua* establishes the abbey of Thelema in another of Rabelais's most elaborate literary passages, where all the points most obnoxious to him in monastic life are indicated by the assignment of their exact opposites to this model convent. The second book, which introduces the principal hero of the whole, *Pantagruel*, *Gargantua*'s son, is, on any other hypothesis but that already suggested of its prior composition, very difficult to explain, but in itself it is intelligible enough. *Pantagruel* goes through something like a second edition (really a first) of the educational experiences of his father. Like him, he goes to Paris, and there meets with Panurge, the principal triumph of Rabelaisian character-drawing, and the most original as well as puzzling figure of the book. Panurge has almost all intellectual accomplishments, but is totally devoid of morality: he is a coward, a drunkard, a lecher, a spiteful trickster, a spendthrift, but all the while infinitely amusing. This book, like the other, has a war in its latter part; *Gargantua* scarcely appears in it and Friar John not at all. It is not till the opening of the third book that the most important action begins. This arises from Panurge's determination to marry—a determination, however, which is very half-hearted, and which leads him to consult a vast number of authorities, each giving occasion for satire of a more or less complicated kind. At last it is determined that *Pantagruel* and his followers (Friar John has reappeared in the suite of the prince) shall set sail to consult the Oracle of the *Dive Bouteille*. The book ends with the obscurest passage of the whole, an elaborate eulogy of the "herb pantagruelion," which appears to be, if it is anything, hemp. Only two probable explanations of this have been offered, the one seeing in it an anticipation of Joseph de Maistre's glorification of the executioner, the other a eulogy of work, hemp being on the whole the most serviceable of vegetable products for that purpose. The fourth and fifth books are entirely taken up with a description of the voyage. Many strange places with stranger names are visited, some of them offering obvious satire on human institutions, others, except by the most far-fetched explanations, resolvable into nothing but sheer extravaganzas. At last the Land of Lanterns, borrowed from Lucian, is reached, and the Oracle of the Bottle is consulted. This yields the single word "Tring," which the attendant priestess declares to be the most gracious and intelligible she has ever heard from it. Panurge takes this as a sanction of his marriage and the book ends abruptly. This singular romance is diversified by or, to speak more properly, it is the vehicle of the most bewildering abundance of digression, burlesque amplification, covert satire on things political, social, and religious, miscellaneous erudition of the literary and scientific kind. Everywhere the author lays stress on the excellence of "Pantagruelism," and the reader who is himself a *Pantagruelist* (it is perfectly idle for any other to attempt the book) soon discovers

what this means. It is, in plain English, humour. The definition of humour is a generally acknowledged *cruce*, and till it is defined the definition of Pantagruelism will be in the same position. But that it consists in the extension of a wide sympathy to all human affairs together with a comprehension of their vanity may be said as safely as anything else. Moroseness and dogmatism are as far from the Pantagruelism of Rabelais as maudlin sentimentality or dilettantism. Perhaps the chief things lacking in his attitude are, in the first place, reverence, of which, however, from a few passages, it is clear he was by no means totally devoid, and an appreciation of passion and poetry. Here and there there are touches of the latter, as in the portrait of Quintessence, but passion is everywhere absent—an absence for which the comic structure and plan of the book does not by any means supply a complete explanation.

For a general estimate of Rabelais's literary character and influence the reader may be referred to the article FRANCE (vol. ix. p. 652). But some detailed remarks must be given here. The life and works of Rabelais, despite the considerable number of publications of which they have been the subject, have hitherto been less fully and satisfactorily treated than the life and works of any author who occupies an equally important place. As will have been seen from the foregoing attempt to give the actual facts, a whole legend has grown up round the scanty details recorded of him, and many, if not all, of the particulars of that legend can be shown to be false. But no one hitherto has undertaken in a satisfactory fashion the construction of a rigorously critical life. In the same way there are many questions in reference to his main work which have never been thoroughly and finally sifted by a critical intelligence equal to the task. Limits of space, to say no more, prevent any such attempt being made here; but there are three questions without the discussion of which this notice of one of the foremost writers of the world would not be worthy of its present place. These are—What is the general drift and purpose of *Gargantua* and *Pantagruel*, supposing there to be any? What defence can be offered, if any defence is needed, for the extraordinary licence of language and imagery which the author has permitted himself? What was his attitude towards the great questions of religion, philosophy, and politics? These questions succeed each other in the order of reason, and the answer to each assists the resolution of the next.

There have been few more remarkable instances of the *lues commentatoria* than the work of the editors of Rabelais. Almost every one appears to have started with a Rabelais ready made in his head, and to have, so to speak, read that Rabelais into the book. Those who have not done this, like Le Duchat, Motteux, and Esmangart, have generally committed the error of tormenting themselves and their author to find individual explanations of personages and events. The extravagance of the last-named commentator takes the form of seeing elaborate allegories; that of some others devotes itself chiefly to identifying the characters of the romance with more or less famous historical persons. But the first blunder, that of forming a general hypothetical conception of Rabelais and then adjusting interpretation of the work to it, is the commoner. This conception, however, has singularly varied. According to some expositors, among whom the latest and not the least respectable is M. Fleury, Rabelais is a sober reformer, an apostle of earnest work, of sound education, of rational if not dogmatic religion, who wraps up his morals in a farcical envelope partly to make them go down with the vulgar and partly to shield himself from the consequences of his reforming zeal. According to others, of whom we have had in England a distinguished example in Mr Besant, Rabelais is all this but with a difference. He is not religious at all; he is more or less anti-religious; and his book is more or less of a general protest against any attempt to explain supernaturally the riddle of the earth. According to a third class, the most distinguished recent representative of which was M. Paul Lacroix, the Rabelaisian legend does not so much err in principle as it invents in fact. Rabelais is the incarnation of the "esprit Gaulois," a jovial careless soul, not destitute of common sense or even acute intellectual power, but first of all a good fellow, rather preferring a broad jest to a fine-pointed one, and rollicking through life like a good-natured undergraduate. Of all these views it may be said that those who hold them are obliged to shut their eyes to many things in the book and to see in it many which are not there. The religious part of the matter will be dealt with presently; but it is impossible to think that any unbiased judge reading Rabelais can hold the grave philosopher view or the reckless good fellow view without modifications and allowances which practically deprive either of any value as a sufficient explanation of the book and its writer. Those who, as it has been happily put, identify Rabelais with Pantagruel, strive in vain on any view intellectually consistent or morally respectable to account for the vast ocean of pure or impure laughter and foolery which surrounds the few solid islets of sense and reason and devotion. Those who in the same way identify Rabelais with Panurge can never explain the education scheme, the solemn apparition of Gargantua among the farcical and fantastic variations on Panurge's wedding, and many other passages; while, on the other hand, those who insist on a definite propaganda of

any kind must justify themselves by their own power of seeing things invisible to plain men. But these vagaries are not only unjustifiable; they are entirely unnecessary. No one reading Rabelais without *parti pris*, but with a good knowledge of the history and literature of his own times and the times which preceded him, can have much difficulty in appreciating his book. He had evidently during his long and studious sojourn in the cloister (a sojourn which was certainly not less than five-and-twenty years, while it may have been five-and-thirty, and of which the studiousness rests not on legend but on documentary evidence) acquired a vast stock of learning. He was, it is clear, thoroughly penetrated with the instincts, the hopes, and the ideas of the Renaissance in the form which it took in France, in England, and in Germany,—a form, that is to say, not merely humanist but full of aspirations for social and political improvement, and above all for a joyous, varied, and non-ascetic life. He had thoroughly convinced himself of the abuses to which monachism lent itself. Lastly, he had the spirit of lively satire and of willingness *desipere in loco* which frequently goes with the love of books. It is in the highest degree improbable that in beginning his great work he had any definite purpose or intention. The habit of burlesquing the *romans d'aventures* was no new one, and the form lent itself easily to the two literary exercises to which he was most disposed,—apt and quaint citation from and variation on the classics and satirical criticism of the life he saw around him. The immense popularity of the first two parts induced him to continue them, and by degrees (the genuineness of the fifth book at any rate in substance is here assumed) the possibility of giving the whole something like a consistent form and a regular conclusion presented itself to him. The voyage in particular allowed the widest licence of satirical allusion, and he availed himself of that licence in the widest sense. Here and there persons are glanced at, while the whole scenery of his birthplace and its neighbourhood is curiously worked in; but for the most part the satire is typical rather than individual, and it is on the whole a rather negative satire. In only two points can Rabelais be said to be definitely polemic. He certainly hated the monkish system in the debased form in which it existed in his time; he as certainly hated the brutish ignorance into which the earlier systems of education had suffered too many of their teachers and scholars to drop. At these two things he was never tired of striking, but elsewhere, even in the grim satire of the *Chats fourrés*, he is the satirist proper rather than the reformer. It is in the very absence of any cramping or limiting purpose that the great merit and value of the book consist. It holds up an almost perfectly level and spotless mirror to the temper of the earlier Renaissance. The author has no universal medicine of his own (except Pantagruelism) to offer, nor has he anybody else's universal medicine to attack. He ranges freely about the world, touching the laughable sides of things with kindly laughter, and every now and then dropping the *risible* and taking to the *rationale*. It is not indeed possible to deny that in the Oracle of the Bottle, besides its merely jocular and fantastic sense, there is a certain "echo," as it has been called, "of the conclusion of the preacher," a certain acknowledgment of the vanity of things. But in such a book such a note could hardly be wanting unless the writer had been a fanatic, which he was not, or a mere voluptuary, which he was not, or a dullard, which he was least of all. It is, after all, little more than a suggestion, and is certainly not strengthened by anything in the body of the work. Rabelais is, in short, if he be read without prejudice, a humourist pure and simple, feeling often in earnest, thinking almost always in jest. He is distinguished from the two men who alone can be compared to him in character of work and force of genius combined—Lucian and Swift—by very marked characteristics. He is much less of a mere mocker than Lucian, and he is entirely destitute, even when he deals with monks or pedants, of the ferocity of Swift. He neither sneers nor rages; the *rire immense* which distinguishes him is altogether good-natured; but he is nearer to Lucian than to Swift, and Lucian is perhaps the author whom it is most necessary to know in order to understand him rightly.

If this general view is correct (and it may at least claim to be founded on nothing but the reading of Rabelais himself without prejudice and with a tolerable apparatus) it will probably condition to some extent the answer to be given to the two minor questions stated above. The first is connected with the great blemish of *Gargantua* and *Pantagruel*,—their extreme coarseness of language and imagery. It is somewhat curious that some of those who claim Rabelais as an enemy of the supernatural in general have been the loudest to condemn this blemish, and that some of them have made the exceedingly lame excuse for him that it was a means of wrapping up his propaganda and keeping it and himself safe from the notice of the powers that were. This is not complimentary to Rabelais, and, except in some very small degree, it is not likely to be true. For as a matter of fact obscenity no less than impiety was charged against him by his ultra-orthodox enemies, and the obscenity no less than the supposed impiety gave them a handle against him before such bodies as the Sorbonne and the parliaments. As for the extreme theory of the anti-Rabelaisians, that Rabelais

was a "dirty old blackguard" who liked filth and wallowed in it from choice, that hardly needs comment. His errors in this way are of course, looked at from an absolute standard, unpardonable. But judged relatively there are several, we shall not say excuses, but explanations of them. In the first place, the comparative indecency of Rabelais has been much exaggerated by persons unfamiliar with early French literature. The form of his book was above all things popular, and the popular French literature of the Middle Ages as distinguished from the courtly and literary literature, which was singularly pure, can hardly be exceeded in point of coarseness. The *fabliaux*, the early burlesque romances of the *Audigier* class, the farces of the 15th century, equal (the grotesque iteration and amplification which is the note of *Gargantua* and *Pantagruel* being allowed for, and sometimes without that allowance) the coarsest passages of Rabelais. His coarseness, moreover, disgusting as it is, has nothing of the corruption of refined voluptuousness about it, and nothing of the sniggering indecency which disgraces men like Pope, like Voltaire, and like Sterne. It shows in its author a want of reverence, a want of decency in the proper sense, a too great readiness to condescend to the easiest kind of ludicrous ideas and the kind most acceptable at that time to the common run of mankind. The general taste having been considerably refined since, Rabelais has in parts become nearly unreadable, —the worst and most appropriate punishment for his faults. As for those who have tried to make his indecency an argument for his laxity in religious principle, that argument, like another mentioned previously, hardly needs discussion. It is notoriously false as a matter of experience. Rabelais could not have written as he has written in this respect and in others if he had been an earnestly pious person, taking heed to every act and word, and studious equally not to offend and not to cause offence. But no one in his senses would dream of claiming any such character for him.

This brings us to the last point—what his religious opinions were. He has been claimed as a freethinker of all shades, from undogmatic theism to atheism, and as a concealed Protestant. The last of these claims has now been very generally given up, and indeed Erasmus might quite as reasonably be claimed for the Reformation as Rabelais. Both disliked and attacked the more crying abuses of their church, and both at the time and since have been disliked and attacked by the more imprudent partisans of that church. But Rabelais, in his own way, held off from the Reformation even more distinctly than Erasmus did. The accusation of freethinking, if not of directly anti-Christian thinking, has always been more common and has recently found much favour. It is, however, remarkable that those who hold this opinion never give chapter and verse for it, and it may be said confidently that chapter and verse cannot be given. The sayings attributed to Rabelais which colour the idea (such as the famous "Je vais chercher un grand peut-être," said to have been uttered on his death-bed) are, as has been said, purely apocryphal. In the book itself nothing of the kind is to be found. Perhaps the nearest approach to it is a jest at the Sorbonne couched in the Pauline phrase about "the evidence of things not seen," which the author removed from the later editions. But irreverences of this kind, as well as the frequent burlesque citations of the Bible, whether commendable or not, had been, were, have since been, and are common in writers whose orthodoxy is unquestioned; and it must be remembered that the later Middle Age, which in many respects Rabelais represents almost more than he does the Renaissance, was, with all its unquestioning faith, singularly reckless and, to our fancy, irreverent in its use of the sacred words and images, which were to it the most familiar of all images and words. On the other hand, there are in the book, in the description of *Gargantua*'s and *Pantagruel*'s education, in the sketch of the abbey of Thelema, in several passages relating to *Pantagruel*, expressions which either signify a sincere and unfeigned piety of a simple kind or else are inventions of the most detestable hypocrisy. For these passages are not, like many to be found from the Renaissance to the end of the 18th century, obvious flags of truce to cover attacks,—mere bowings in the house of Rimmon to prevent evil consequences. There is absolutely no sign of the tongue in the cheek. They are always written in the author's highest style, a style perfectly eloquent and unaffected; they can only be interpreted (on the freethinking hypothesis) as allegorical with the greatest difficulty and obscurity, and it is pretty certain that no one reading the book without a thesis to prove would dream of taking them in a non-natural sense. It is not, indeed, to be contended that Rabelais was a man with whom religion was in detail a constant thought, that he had a very tender conscience or a very scrupulous orthodoxy. His form of religious sentiment was not evangelical or mystical, any more than it was ascetic or ceremonial or dogmatic. As regards one of the accepted doctrines of his own church, the excellence of the celibate life, of poverty, and of elaborate obedience to a rule, he no doubt was a strong dissident; but the evidence that, as a Christian, he was unorthodox, that he was even a heretical or latitudinarian thinker in regard to those doctrines which the various Christian churches have in common, is not merely weak, it is

practically non-existent. The counter testimony is, indeed, not very strong and still less detailed. But that is not the point. It is sufficient to say that there is absolutely nothing within the covers of Rabelais's works incompatible with an orthodoxy which would be recognized as sufficient by Christendom at large, leaving out of the question those points of doctrine and practice on which Christians differ. Beyond this no wise man will go, and short of it hardly any unprejudiced man will stop.

The dates of the original editions of Rabelais's works have been given where possible already. The earlier books were repeatedly reissued during the author's life, and always with some correction. What may be called the first complete edition appeared in 1567 at Lyons, published by Jean Martin. It is computed that no less than sixty editions were printed before the close of the 16th century. A very considerable time, however, elapsed before the works were, properly speaking, edited. Huet devoted much pains to them, but his results were not made public. The first edition which calls for notice, except in a complete bibliography, is that of Le Duchat (Amsterdam, 1711). Le Duchat was a very careful student, and on the whole a very efficient editor, being perhaps, of the group of students of old French at the beginning of the 18th century, which included La Monnoye and others, the most sober, critical, and accomplished. But at that time the knowledge of the period was scarcely far enough advanced. The next important date in the bibliography of Rabelais is 1823, in which year appeared the most elaborate edition of his work yet published, that of Esmangart and Johanneau (9 vols.), including for the first time the "Songes Drolatiques," a spurious but early and not uninteresting collection of grotesque figure-drawings illustrating *Gargantua* and *Pantagruel*, and the second edition of M. de l'Aulnay, containing a bad text but a useful glossary. From this time the editions have been very numerous. Among them may be mentioned those illustrated by Gustave Doré, first on a small scale (1854), afterwards more elaborately (1870); that of the Collection Didot by Burgaud des Marets and Rathery (1859, second edition 1870); the Bibliothèque Elzévirienne edition by MM. Lacour and A. de Montaignon; that of the Nouvelle Collection Jannet (seven small volumes, 1867-74), completed by M. Moland; and lastly, the edition of M. Marty-Laveaux in the Collection Lemerre (1868-81), which is unfortunately not yet completed, but which when finished will undoubtedly be the handsomest, the most accurate, and the most complete in the scholarly sense yet published. At present the most really useful edition which combines a handsome form with cheapness is that of the Nouvelle Collection Jannet, though that of MM. Burgaud des Marets and Rathery is not to be despised. Commentaries on Rabelais, independent of editions, have been especially numerous of late years; the work of MM. Reville, Noel, Mayrargues, and Gebhart may be mentioned. But the best recent book on the subject in French is that of M. J. Fleury (2 vols., Paris, 1876), which, though deficient in exactitude as to many points of detail, and sacrificing something to a desire of presenting Rabelais as a great social philosopher, is, on the whole, very sensible and complete.

Rabelais was very early popular in England. There are possible allusions to him in Shakespeare, and the current clerical notion of him is very unjustly adopted by Marston in the words "wicked Rabelais"; but Bacon described him better as the great jester of France, and a Scot, Sir Thomas Urquhart, translated the earlier books in 1653. This was not worthily completed till the luckless Motteux, or, as his compatriots call him, Le Motteux, finished it with an extensive commentary. Criticism of a scattered kind on Rabelais in English is abundant, that of Coleridge being the most important, while the constant evidence of his influence in Southey's *Doctor* is also noteworthy. But he was hardly treated as a whole before Mr Besant's book on the subject in the *Foreign Classics for English Readers* (1879), which the author has since followed up with *Readings from Rabelais* (1883). Mr Besant has too readily adopted (probably from Michelet) the apocryphal scandals as to the difference between Rabelais and the poets of the Pléiade, and is committed (it is not quite clear why) to a view of Rabelais as a non-Christian thinker and preacher for which it is impossible to discover solid justification. But otherwise his books form the best introduction possible for a modern English reader to this great author.

(G. S. A.)

RABENER, GOTTLIEB WILHELM (1714-1771), German satirist, was born in 1714 near Leipsic, and after studying law at that city entered the civil service, in which he continued for many years. He died on 22d March 1771. The papers which he published in the *Bremer Beiträge* were subsequently collected into a *Sammlung satirischer Schriften* (2 vols., 1751), to which two volumes were afterwards added. The work passed through numerous editions. Rabener's *Freundschaftliche Briefe* were published posthumously by C. F. Weiss with a biography. (See GERMANY, vol. x. p. 533.)

RABIES, a virulent disease, developed primarily in a peculiar to the canine species. Its occurrence in the same manner in other carnivorous animals, as the fox, wolf, hyæna, jackal, raccoon, badger, and skunk, has been asserted; but there is every probability that it is originally a disease of the dog. It is communicated by inoculation to nearly all, if not all, warm-blooded creatures. The transmission from one animal to another only certainly takes place through inoculation with viruliferous matters. The malady is generally characterized at a certain stage by an irrepressible desire in the animal to act offensively with its natural weapons,—dogs and other carnivora attacking with their teeth, herbivora with their hoofs or horns, and birds with their beaks, when excited ever so slightly. In the absence of excitement the malady may run its course without any fit of fury or madness. Transmission of the disease to man produces HYDROPHOBIA (*q.v.*) or dread of water, but in animals this symptom is rarely, if ever, observed. Rabies has been known from the very earliest times, and serious outbreaks have been recorded as occurring among dogs, wolves, and foxes in different parts of the world, particularly in western Europe and in North and South America. It is very frequent in Europe and appears to be on the increase. France, Germany, upper Italy, and Holland evidently suffer more than other Continental countries. England is becoming more frequently visited than before, though Scotland and Ireland are much less troubled than England. Spain is also sometimes severely scourged by it; but it is rare in Portugal. On the American continent it is well known, though on the eastern side of the Andes it is rarely if ever seen; and it has never been heard of in Quito. In the West Indies—in Hispaniola, Jamaica, Domingo, Havana, Guadaloupe, and Hayti—as well as in Ceylon, it is frequently witnessed, and in 1813 it was introduced into Mauritius. It exists in North and South China, and has been reported in Cochin China and the kingdom of Anam. It is frequent and fatal in India; and it is by no means rare in Syria, Palestine, and Turkey. It has been observed in the Hijáz in Arabia, and in North Africa and Egypt. Hydrophobia has been reported in Algeria; but Rohlf asserts that it is unknown in Morocco. Gibraltar and Malta have been seriously invaded at times, and in Sweden, Denmark, Norway, Russia, and Lapland it has been frequently seen in an epizootic form; but it is not yet positively decided whether it exists in the Arctic regions. Steller and Erman assert that it is unknown in Kamchatka and Greenland; but Hayes (*The Open Polar Sea*) gives us the particulars of an outbreak of disease in South Greenland, which persisted for several years, caused him the loss of his sledge-dogs in 1870, and in 1872 extended from Smith's Sound to Jakobshavn, threatening the utter extinction of the species, and with it the disappearance of the Eskimo. In most of its features it appeared to be rabies. The scourge is unknown, according to reliable evidence, in Australia and New Zealand, Tasmania, the Azores, and St Helena, as well as the island of Madeira; it has not been seen at Sumatra, nor in East, South, and West Africa, nor in the island of Réunion.

Rabies (hydrophobia) is almost invariably fatal in man, and in the dog it nearly always terminates in death, though instances of recovery are recorded; and it is extremely probable that in those cases in which people have been bitten by dogs and subsequently perished from hydrophobia, without the animals themselves offering any marked indications of illness either at the time or afterwards, these have been suffering from a mild form of the disease. It is also fatal to horses, cows, pigs, goats, and cats, but not to fowls, many of these recovering from accidental or experimental inoculation. Indeed rabies varies consider-

ably in intensity and in the character of its symptoms in different species of creatures. Pasteur has shown that, if it is transmitted from the diseased dog to the monkey and ultimately from monkey to monkey, at each transmission it becomes more attenuated in virulence, and remains so attenuated when passed again to the dog, rabbit, or guinea-pig, nor will it any longer produce the disease in dogs by hypodermic inoculations. Even inoculation by trepanning the cranium, which is so infallible in conveying rabies, may produce no result, the dog thenceforward being protected, and no longer capable of receiving the disease. On the other hand, the rabific virus is intensified when passed from rabbit to rabbit, or from guinea-pig to guinea-pig; and after several transmissions through the bodies of these animals it regains the maximum virulence which it possessed before it was enfeebled by being passed through the monkey. And the same thing holds with respect to the virulence of the ordinary rabid dog: when virus which is far from having reached its maximum intensity is conveyed to the rabbit, it requires to be passed through several of these animals before it reaches its maximum. It may be mentioned that the disease is not readily conveyed from man to animals, either accidentally or experimentally. The virus appears to exist in greatest intensity in the salivary glands and their secretion, in the brain and spinal cord, and perhaps to a lesser degree in the blood; doubtless it exists also in other fluids and tissues of the diseased animal. The principal alterations found in the bodies of rabid animals after death are located in the spinal cord, especially its upper portion, the medulla oblongata, certain parts of the brain, and the salivary glands, more particularly the submaxillary and sublingual,—less in the parotid. The stomach, kidneys, and other organs also present alterations which are more or less significant, especially the former, in which foreign bodies, as hair, wood, stones, earth, pieces of cloth, &c., are very frequently found. But the nature of the lesions, as well as the symptomatology, shows that the action of the poison is more especially exerted on the brain or spinal cord, though the eighth pair of nerves, and branches of the fifth and seventh pairs, are not involved in animals, as in man.

The period in which the symptoms of the disease become manifest, especially after accidental inoculations, as bites, varies extremely; indeed there is no disease in which the period of latency or incubation is more variable or protracted, this being sometimes limited to a few days or weeks and extending in rare cases to more than twelve months. In experimental inoculations the period is greatly shortened and the results more certain,—all the more so if the virus is introduced into the cranial cavity by trepanning, or into the blood-stream by intravenous inoculation. In accidental inoculations, as in wounds from rabid dogs, a certain but varying percentage escape. This immunity may be due to natural non-receptivity, to the wound not having been inflicted in a very vascular part, or to the saliva having been expended from frequent bites on other animals, or intercepted by clothing, hair, wool, &c.

Symptoms.—The disease has been divided into three stages or periods, and has also been described as appearing in at least two forms, according to the peculiarities of the symptoms. But, as a rule, one period of the disease does not pass suddenly into another, the transition being almost imperceptible; and the forms do not differ essentially from each other, but appear merely to constitute varieties of the same disease, due to the natural disposition of the animal, or other modifying circumstances. These forms have been designated *true* or *furious rabies* (Fr. *rage vrai*; Germ. *rasende Wuth*) and *dumb rabies* (Fr. *rage muet*; Germ. *stille Wuth*).

The malady does not commence with fury and madness, but in a strange and anomalous change in the habits of the dog: it becomes dull, gloomy, and taciturn, and seeks to isolate itself in out-of-the-way places, retiring beneath chairs and to odd corners. But in its retirement it cannot rest: it is uneasy and fidgety, and no

sooner has it lain down than suddenly it jumps up in an agitated manner, walks backwards and forwards several times, again lies down and assumes a sleeping attitude, but has only maintained it for a few minutes when it is once more moving about. Again it retires to its corner, to the farthest recess it can find, and huddles itself up into a heap, with its head concealed beneath its chest and fore-paws. This state of continual agitation and inquietude is in striking contrast with its ordinary habits, and should therefore receive attention. Not unfrequently there are a few moments when the creature appears more lively than usual, and displays an extraordinary amount of affection. Sometimes there is a disposition to gather up straw, thread, bits of wood, &c., which are industriously carried away; a tendency to lick anything cold, as iron, stones, &c., is also observed in many instances; and there is also a desire evinced to lick other animals. Sexual excitement is also frequently an early symptom. At this period no disposition to bite is observed; the animal is docile with its master and obeys his voice, though not so readily as before, nor with the same pleased countenance. There is something strange in the expression of its face, and the voice of its owner is scarcely able to make it change from a sudden gloominess to its usual animated aspect. These symptoms gradually become more marked: the restlessness and agitation increase. If on straw the dog scatters and pulls it about with its paws, and if in a room it scratches and tumbles the cushions or rugs on which it usually lies. It is incessantly on the move, rambling about, scratching the ground, sniffing in corners and at the doors, as if on the scent or seeking for something. It indulges in strange movements, as if affected by some mental influences, or a prey to hallucinations. When not excited by any external influence it will remain for a brief period perfectly still and attentive, as if watching something, or following the movements of some creature on the wall; then it will suddenly dart forward and snap at the vacant air, as if pursuing an annoying object, or endeavouring to seize a fly. At another time it throws itself, yelling and furious, against the wall, as if it heard threatening voices on the other side, or was bent on attacking an enemy. Nevertheless, the animal is still docile and submissive, for its master's voice will bring it out of its frenzy. But the saliva is already virulent, and the excessive affection which it evinces at intervals, by licking the hands or face of those it loves, renders the danger very great should there be a wound or abrasion. Until a late period in the disease the master's voice has a powerful influence over the animal. When it has escaped from all control and wanders erratically abroad, ferocious and restless, and haunted by horrid phantoms, the familiar voice yet exerts its influence, and it is rare indeed that it attacks its master.

There is no dread of water in the rabid dog; the animal is generally thirsty, and if water be offered will lap it with avidity, and swallow it at the commencement of the disease. And, when, at a later period, the constriction about the throat—symptomatic of the disease—renders swallowing difficult, the dog will none the less endeavour to drink, and the lappings are as frequent and prolonged when deglutition becomes impossible. So little dread has the rabid dog of water that it will ford streams and swim rivers; and when in the ferocious stage it will even do this in order to attack other creatures on the opposite side. The evidence on this head is overwhelming.

At the commencement of the disease the dog does not usually refuse to eat, and some animals are voracious to an unusual degree. But in a short time it becomes fastidious, only eating what it usually has a special predilection for. Soon, however, this gives place to a most characteristic symptom—either the taste becomes extremely depraved or the dog has a fatal and imperious desire to bite and ingest everything. The litter of its kennel, wool from cushions, carpets, stockings, slippers, wood, grass, earth, stones, glass, horse-dung, even its own feces and urine, or whatever else may come in its way, are devoured. On examination of the body of a dog which has died of rabies it is so common to find in the stomach a quantity of dissimilar and strange matters on which the teeth have been exercised that, if there was nothing known of the animal's history, there would be strong evidence of its having been affected with the disease. When a dog, then, is observed to gnaw and eat suchlike matters, though it exhibits no tendency to bite, it should be suspected.

The mad dog does not usually foam at the mouth to any great extent at first. The mucus of the mouth is not much increased in quantity, but it soon becomes thicker, viscid, and glutinous, and adheres to the angles of the mouth, fauces, and teeth. It is at this period that the thirst is most ardent, and the dog sometimes furiously attempts to detach the saliva with its paws; and, if after a while it loses its balance in these attempts and tumbles over, there can no longer be any doubt as to the nature of the malady. There is another symptom connected with the mouth in that form of the disease named "dumb madness" which has frequently proved deceptive. The lower jaw drops in consequence of paralysis of its muscles, and the mouth remains open. The interior is dry from the air passing continually over it, and assumes a deep red

tint, somewhat masked by patches of dust or earth, which more especially adhere to the upper surface of the tongue and to the lips. The strange alteration produced in the dog's physiognomy by its constantly open mouth and the dark colour of the interior is rendered still more characteristic by the dull, sad, or dead expression of the animal's eyes. In this condition the creature is not very dangerous, because generally it could not bite if it tried,—indeed there does not appear to be much desire to bite in dumb madness; but the saliva is none the less virulent, and accidental inoculations with it, through imprudent handling, will prove as fatal as in the furious form. The mouth should not be touched,—numerous deaths having occurred through people thinking the dog had some foreign substance lodged in its throat, and thrusting their fingers down to remove it. The sensation of tightness which seems to exist at the throat causes the dog to act as if a bone were fixed between its teeth or towards the back of its mouth, and to employ its fore-paws as if to dislodge it. This is a very deceptive symptom, and may prove equally dangerous if caution be not observed. Vomiting of blood or a chocolate-coloured fluid is witnessed in some cases, and has been supposed to be due to the foreign substances in the stomach, which abrade the lining membrane; this, however, is not correct, as it has been observed in man.

The voice of the rabid dog is very peculiar, and so characteristic that to those acquainted with it nothing more is needed to prove the presence of the disease. Those who have heard it once or twice never forget its signification. Owing to the alterations taking place in the larynx the voice becomes hoarse, cracked, and stridulous, like that of a child affected with croup,—the "voix du coq," as the French have it. A preliminary bark is made in a somewhat elevated tone and with open mouth; this is immediately succeeded by five, six, or eight decreasing howls, emitted when the animal is sitting or standing, and always with the nose elevated, which seem to come from the depths of the throat, the jaws not coming together and closing the mouth during such emission, as in the healthy bark. This alteration in the voice is frequently the first observable indication of the malady, and should at once attract attention. In dumb madness the voice is frequently lost from the very commencement,—hence the designation.

The sensibility of the mad dog appears to be considerably diminished, and the animal appears to have lost the faculty of expressing the sensations it experiences: it is mute under the infliction of pain, though there can be no doubt that it still has peripheral sensation to some extent. Burning, beating, and wounding produce much less effect than in health, and the animal will even mutilate itself with its teeth. Suspicion, therefore, should always strongly attach to a dog which does not manifest a certain susceptibility to painful impressions and receives punishment without any cry or complaint. There is also reason for apprehension when a dog bites itself persistently in any part of its body. A rabid dog is usually stirred to fury at the sight of one of its own species; this test has been resorted to by Bouley to dissipate doubts as to the existence of the disease when the diagnosis is otherwise uncertain. As soon as the suspected animal, if it is really rabid, finds itself in the presence of another of its species it at once assumes the aggressive, and, if allowed, will bite furiously. All rabid animals indeed become excited, exasperated, and furious at the sight of a dog, and attack it with their natural weapons, even the timid sheep when rabid butts furiously at the enemy before which in health it would have fled in terror. This inversion of sentiment is sometimes valuable in diagnosing the malady; it is so common that it may be said to be present in every case of rabies. When, therefore, a dog, contrary to its habits and natural inclination, becomes suddenly aggressive to other dogs, it is time to take precautions.

In the large majority of instances the dog is inoffensive in the early period of the disease to those to whom it is familiar. It then flies from its home and either dies, is killed as "mad," or returns in a miserable plight, and in an advanced stage of the malady, when the desire to bite is irresistible. It is in the early stage that sequestration and suppressive measures are most valuable. The dogs which propagate the disease are usually those that have escaped from their owners. After two or three days, frequently in about twelve hours, more serious and alarming symptoms appear, ferocious instincts are developed, and the desire to do injury is irrepressible. The animal has an indefinable expression of sombre melancholy and cruelty. The eyes have their pupils dilated, and emit flashes of light when they are not dull and heavy; they always appear so fierce as to produce terror in the beholder; they are red and their sensibility to light is increased; and wrinkles, which sometimes appear on the forehead, add to the repulsive aspect of the animal. If caged it flies at the spectator, emitting its characteristic howl or bark, and seizing the iron bars with its teeth, and if a stick be thrust before it this is grasped and gnawed. This fury is soon succeeded by lassitude, when the animal remains insensible to every excitement. Then all at once it rouses up again, and another paroxysm of fury commences. The first paroxysm is usually the most intense, and the fits vary in duration from some hours to a day, and even longer; they are ordinarily briefer in trained and

pet dogs than in those which are less domesticated, but in all the remission is so complete after the first paroxysm that the animals appear to be almost well, if not in perfect health. During the paroxysms respiration is hurried and laboured, but tranquil during the remissions. There is an increase of temperature and the pulse is quick and hard. When the animal is kept in a dark place and not excited, the fits of fury are not observed. Sometimes it is agitated and restless in the manner already described. It never becomes really furious or aggressive unless excited by external objects,—the most potent of these, as has been said, being another dog, which, however, if it be admitted to its cage, it may not at once attack. The attacked animal rarely retaliates, but usually responds to the bites by acute yells, which contrast strangely with the silent anger of the aggressor, and tries to hide its head with its paws or beneath the straw. These repeated paroxysms hurry the course of the disease. The secretion and flowing of a large quantity of saliva from the mouth are usually only witnessed in cases in which swallowing has become impossible, the mouth being generally dry. At times the tongue, nose, and whole head appear swollen. Other dogs frequently shun one which is rabid, as if aware of their danger.

The rabid dog, if lodged in a room or kept in a house, is continually endeavouring to escape; and when it makes its escape it goes freely forward, as if impelled by some irresistible force. It travels considerable distances in a short time, perhaps attacking every living creature it meets,—preferring dogs, however, to other animals, and these to mankind; cats, sheep, cattle, and horses are particularly liable to be injured. It attacks in silence, and never utters a snarl or a cry of anger; should it chance to be hurt in return it emits no cry or howl of pain. The degree of ferocity appears to be related to natural disposition and training. Some dogs, for instance, will only snap or give a slight bite in passing, while others will bite furiously, tearing the objects presented to them, or which they meet in their way, and sometimes with such violence as to injure their mouth and break their teeth, or even their jaws. If chained, they will in some cases gnaw the chain until their teeth are worn away and the bones laid bare. The rabid dog does not continue its progress very long. Exhausted by fatigue and the paroxysms of madness excited in it by the objects it meets, as well as by hunger, thirst, and also, no doubt, by the malady, its limbs soon become feeble; the rate of travelling is lessened and the walk is unsteady, while its drooping tail, head inclined towards the ground, open mouth, and protruded tongue (of a leaden colour or covered with dust) give the distressed creature a very striking and characteristic physiognomy. In this condition, however, it is much less to be dreaded than in its early fits of fury, since it is no longer capable of desirous of altering its course or going out of its way to attack an animal or a man not immediately in the path. It is very probable that its fast-fading vision, deadened scent, and generally diminished perception prevent its being so readily impressed or excited by surrounding objects as it previously was. To each paroxysm, which is always of short duration, there succeeds a degree of exhaustion as great as the fits have been violent and oft repeated. This compels the animal to stop; then it shelters itself in obscure places—frequently in ditches by the roadside—and lies there in a somnolent state for perhaps hours. There is great danger, nevertheless, in disturbing the dog at this period; for when roused from its torpor it has sometimes sufficient strength to inflict a bite. This period, which may be termed the second stage, is as variable in its duration as the first, but it rarely exceeds three or four days. The above-described phenomena gradually merge into those of the third or last period, when symptoms of paralysis appear, which are speedily followed by death. During the remission in the paroxysms these paralytic symptoms are more particularly manifested in the hind limbs, which appear as if unable to support the animal's weight, and cause it to stagger about; or the lower jaw becomes more or less drooping, leaving the parched mouth partially open. Emaciation rapidly sets in, and the paroxysms diminish in intensity, while the remissions become less marked. The physiognomy assumes a still more sinister and repulsive aspect; the hair is dull and erect; the flanks are retracted; the eyes lose their lustre and are buried in the orbits, the pupil being dilated, and the cornea dull and semi-opaque; very often, even at an early period, the eyes squint, and this adds still more to the terrifying appearance of the poor dog. The voice, if at all heard, is husky, the breathing laborious, and the pulse hurried and irregular. Gradually the paralysis increases, and the posterior extremities are dragged as if the animal's back were broken, until at length it becomes general; it is then the prelude to death. Or the dog remains lying in a state of stupor, and can only raise itself with difficulty on the fore-limbs when greatly excited. In this condition it may yet endeavour to bite at objects within its reach. At times convulsions of a tetanic character appear in certain muscles; at other times these are general. A comatose condition ensues, and the rabid dog, if permitted to die naturally, perishes, in the great majority of cases, from paralysis and asphyxia.

In dumb madness there is paralysis of the lower jaw, which im-

parts a curious and very characteristic physiognomy to the dog; the voice is also lost, and the animal can neither eat nor drink. In this condition the creature remains with its jaw pendent and the mouth consequently wide open, showing the flaccid or swollen tongue covered with brownish matter, and a stringy gelatinous-looking saliva lying between it and the lower lip and coating the fauces, which sometimes appear to be inflamed. Though the animal is unable to swallow fluids, the desire to drink is nevertheless intense; for the creature will thrust its face into the vessel of water in futile attempts to obtain relief, even until the approach of death. Water may be poured down its throat without inducing a paroxysm. The general physiognomy and demeanour of the poor creature inspire the beholder with pity rather than fear. The symptoms due to cerebral excitement are less marked than in the furious form of the disease; the agitation is not so considerable, and the restlessness, tendency to run away, and desire to bite are nearly absent; generally the animal is quite passive. Not unfrequently one or both eyes squint, and it is only when very much excited that the dog may contrive to close its mouth. Sometimes there is swelling about the pharynx and the neck; when the tongue shares in this complication it hangs out of the mouth. In certain cases there is a catarrhal condition of the membrane lining the nasal cavities, larynx, and bronchi; sometimes the animal testifies to the existence of abdominal pain, and the fæces are then soft or fluid. The other symptoms—such as the rapid exhaustion and emaciation, paralysis of the posterior limbs towards the termination of the disease, as well as the rapidity with which it runs its course—are the same as in the furious form.

The simultaneous occurrence of furious and dumb madness is frequently observed in packs of fox-hounds. Dumb madness differs, then, from the furious type in the paralysis of the lower jaw, which hinders the dog from biting, save in very exceptional circumstances; the ferocious instincts are also in abeyance; and there is no tendency to aggression. It has been calculated that from 15 to 20 per cent. of rabid dogs have this particular form of the disease. Puppies and young dogs chiefly have furious rabies.

These are the symptoms of rabies in the dog; but it is not likely, nor is it necessary, that they will all be present in every case. In other species the symptoms differ more or less from those manifested by the dog, but they are generally marked by a change in the manner and habits of the creatures affected, with strong indications of nervous disturbance, in the majority of species amounting to ferociousness and a desire to injure, timid creatures becoming bold and aggressive. (See Fleming, *Rabies and Hydrophobia*.)

In order to prevent injury from this disease in countries in which it is prevalent owners of dogs should be well acquainted with its symptoms, especially the premonitory ones; of these a change in the demeanour and habits of the animal—unusual irritability, depraved appetite, restlessness, and a tendency to wander from home—are the most marked. One of the chief police measures is diminution in the number of useless dogs. This is best enforced by the imposition of a dog-tax or licence, which may be large or small in proportion to the number of dogs or the urgency of the case. On the licence-paper the chief symptoms of the malady should be described so as to warn dog-owners. Every dog should wear a collar with a brass plate, on which are inscribed the name and address of the owner as well as a police register-number stamped thereon, or some particular mark affixed by the police or inland revenue authorities, for purposes of identification; all stray dogs without a collar of this description ought to be captured, and sold or destroyed after three or more days if not claimed. Blunting the canine and incisor teeth of dogs has also been proposed as a precautionary measure. All dogs suspected of rabies should be captured and, when the existence of the disease is confirmed, destroyed. Rabid dogs should be destroyed at once. It is also well as a precautionary measure to kill dogs or cats which have been bitten or "worried" by rabid animals. During an outbreak of rabies all dogs should be securely muzzled and if possible led. It is a great mistake to destroy immediately suspected dogs which have bitten people; they should be kept until their condition is ascertained, as, if they are found to be healthy, this will greatly relieve the mind of those who have been bitten. Suspected dogs should be carefully kept under observation and frequently inspected by a veterinary surgeon or other competent per-

son. All wounds inflicted by strange or suspected dogs should be immediately attended to and treated by suction, washing, and expression, until proper surgical treatment can be adopted. In those countries in which the disease has not yet appeared, in order to prevent its admission, the importation of dogs should be forbidden or an extended period of quarantine imposed.

We may here allude to the results of Pasteur's experiments in rabies. By passing modified virus into the bodies of dogs he has discovered that they are protected from an attack of the disease—are, in fact, rendered refractory to rabies. For instance, rabific virus is obtained from a rabbit which has died after inoculation by trepanning, and after a period of incubation longer by some days than the shortest period in these animals, which is invariably between seven and eight days subsequent to inoculation with the most active virus. The virus of the rabbit in the period of long incubation is inoculated by trepanning into a second rabbit, the virus of this into a third; and on each occasion the virus, which becomes more and more potent, is inoculated into a dog. The latter at last becomes capable of supporting what would be to other dogs a deadly virus, and is entirely proof against rabies either by intravenous inoculation, by trepanning, or by the virus of a rabid animal. By using the blood of rabid animals in certain determinate conditions Pasteur has been able to greatly simplify the operations of inoculation, and to render dogs most decidedly refractory to the malady. There is great importance attached to the suggestion that now, and until rabies has been extinguished altogether by inoculation, it may be possible to prevent development of the disease after bites from rabid dogs, owing to the long duration of the incubative period. Admitting that rabies is produced by the bite of rabid animals only, and that Pasteur's inoculations are really protective, it is suggested that a law compelling all dogs to be so protected would in the end extirpate the disease. But certain important points have yet to be decided before any definite conclusion can be arrived at.

(G. FL.)

RABUTIN, ROGER DE, COMTE DE BUSSY (1618-1693), commonly known as BUSSY-RABUTIN (and for shortness BUSSY), is perhaps the most characteristic figure among the lesser noblesse of France in the 17th century, as La Rochefoucauld is among the greater. Bussy, however, except in point of gallantry and literary power, chiefly illustrated the evil sides of the character. He represented a family of distinction and age in Burgundy (see SÉVIGNÉ, Madame de), and his father was Léonor de Rabutin, a soldier of merit and a man of position, holding the lieutenant-generalship of the province of Nivernais. Bussy-Rabutin (it is perhaps advisable to add the family name to distinguish him from the hardly less famous Bussy d'Amboise) was born in 1618. He was the third son, but by the death of his elder brothers became the representative of the family. He entered the army when he was only sixteen and fought through several campaigns, succeeding his father in the office of "mestre de camp." But he very early distinguished himself in other ways than that of military service, and in 1641 was sent to the Bastille by Richelieu for some months as a punishment for neglect of his duties in running after his ladyloves. In 1643 he married a cousin, Gabrielle de Toulangeon, who seems to have been fond of him, and for a short time he left the army. But in 1644 he again bought a commission and for some years was closely connected with the great Condé. His wife died, and he became more famous, or at least more notorious, than ever by an attempt to abduct Madame de Miramion, a rich widow. This affair was with some difficulty made up and Bussy afterwards married Louise de

Rouville. When the Fronde broke out he, like others, went from party to party, but finally passed to the royal side. He fought with some distinction both in the civil war and on foreign service, and in 1655 he went to serve under Turenne in Flanders. He served there for several campaigns and distinguished himself at the battle of the Dunes and elsewhere; but he did not get on well with his general, and his quarrelsome disposition, his overweening vanity, and his habit of composing libellous *chansons* by degrees made him the enemy of most persons of position both in the army and at court. In the year 1659 he fell into disgrace for having taken part in an orgy or series of orgies at Roissy near Paris during Holy Week, which caused great scandal, and shortly afterwards he began to compose for the amusement of his mistress, Madame de Montglas, his famous *Histoire Amoureuse des Gaules*. This book—a series of sketches of the chief ladies of the court, not without wit, but much less remarkable for wit than for ill nature and licence—circulated freely in manuscript and had numerous spurious sequels. One of these stung the king, and Bussy was in 1665 sent to the Bastille, where he remained for more than a year, and from which he was only liberated on condition of retiring to his estates. Here he abode in what was then called exile for seventeen years. He was then restored to a modified degree of royal favour, but never received any great mark of it, and died in 1693.

Although a man of considerable abilities, Bussy had very little in his character that was either amiable or estimable. Despite his extravagant pride of birth and rank, there is much reason for acquiescing in the verdict pronounced on him (by an anonymous contemporary apparently), that he was "a coxcomb, who never, either at court or in camp, lost the taste for bad company and the air of a rustic"; his bravery was undoubted, but he seems to have much overrated his own military ability. He libelled friends and foes alike, and any toleration which might be extended to his innumerable gallantries is lessened by his incorrigible habit of telling tales and his spiteful scandal-mongering against women who had left him or whom he had left. He was, however, possessed of much literary power. The *Histoire Amoureuse* is in its most striking passages merely adapted from Petronius, and, except in a few portraits, its attractions are chiefly those of the scandalous chronicle. But his *Mémoires*, published after his death, are extremely lively and characteristic, and his voluminous correspondence yields in variety and interest to few collections of the kind, except Madame de Sévigné's, who indeed is represented in it to a great extent, and whose letters first appeared in it. The literary and historical student, therefore, owes Bussy some thanks. But it is impossible not to see that he united some of the worst characteristics of an aristocracy on the way to decadence—relaxed morals, a glaring indifference to duty and to all motives but self-interest, insolence in prosperity, servility in adverse circumstances, jealousy of others more favoured than himself.

The best edition of the *Histoire Amoureuse des Gaules* is that of Boiteau and Livet in the Bibliothèque Elzévirienne (4 vols., Paris, 1856-76), of the *Mémoires* and *Correspondance* that of Lalanne (8 vols., Paris, 1857-59). Bussy wrote other things, of which the most important, his *Genealogy of the Rabutin Family*, remained in MS. till 1867.

RACCOON. This name,¹ familiar to all readers of works on American natural history, is borne by a small carnivore belonging to that section of the order which contains the bears, weasels, badgers, &c. (see MAMMALIA, vol. xv. p. 440). The raccoon resembles in many respects a diminutive bear, both in its general build and in the proportions of its skull and teeth, which last are broad, blunt, and rounded, and more suited for a semi-vegetarian than for an exclusively animal diet. Its other more important zoological characters, with an account of its systematic position, have been already noted in the article just referred to. The common North-American raccoon (*Procyon lotor*) is a clumsy thickly-built animal about the size of a badger, with a coat of long coarse greyish brown hairs, short ears, and a bushy black and white ringed tail. Its

¹ A corruption of the North-American Indian "arrathkune" or "arathcone." The French *raton* or *raton laveur*, German *Waschbär*, and other European names are derived from a curious habit the raccoon has of dipping or washing its food in water before eating it.

range extends over the whole of the United States, and stretches on the west northwards to Alaska and southwards

Raccoon.

well into Central America, where it attains its maximum size. The following notes on the habits of the raccoon are extracted from Dr C. Hart Merriam's charming work on the mammals of the Adirondacks (N. E. New York).

"Raccoons are omnivorous beasts and feed upon mice, small birds, birds' eggs, turtles and their eggs, frogs, fish, crayfish, molluscs, insects, nuts, fruits, maize, and sometimes poultry. Excepting alone the bats and flying-squirrels, they are the most strictly nocturnal of all our mammals, and yet I have several times seen them abroad on cloudy days. They haunt the banks of ponds and streams, and find much of their food in these places, such as crayfish, mussels, and fish, although they are unable to dive and pursue the latter under water, like the otter and mink. They are good swimmers and do not hesitate to cross rivers that lie in their path. . . . The raccoon hibernates during the severest part of the winter, retiring to its nest rather early, and appearing again in February or March, according to the earliness or lateness of the season. It makes its home high up in the hollow of some large tree, preferring a dead limb to the trunk itself. It does little in the way of constructing a nest, and from four to six young are commonly born at a time, generally early in April in this region. The young remain with the mother about a year."

The South-American species, *Procyon cancrivorus*, the crab-eating raccoon, is very similar to *P. lotor*, but differs by its much shorter fur, larger size, proportionally more powerful teeth, and other minor characters. It extends over the whole of South America, as far south as the Rio Negro, and is very common in all suitable localities. Its habits are similar to those of the North-American species.

RACHEL (1820 or 1821-1858), the stage name of a French actress, whose true name was ELIZABETH FÉLIX, and who was the daughter of Jacob Félix and Esther Haya, Alsatian Jews, who travelled on foot through France as pedlars. She was born according to one account on 24th March 1820, according to another on 28th February of the following year, in a small inn in Mumpf in the canton of Aargau, Switzerland. At Rheims she and her eldest sister Sophia, afterwards known as Sarah, joined a troupe of Italian children who made their living by singing in the cafés, Sarah taking part in the singing and Elizabeth, then only four years of age, collecting the coppers. In 1830 they came to Paris, where they sang in the streets, Rachel giving such patriotic songs as the *Parisienne* and the *Marseillaise* with a rude but precocious energy which evoked special admiration and an abundant shower of coppers. Choron, a famous teacher of singing, was so impressed with the talents of the two sisters that he undertook to give them gratuitous instruction, and after his death in 1833 they were received into the Conservatoire.

Sophia gained a medal for singing, but Rachel at an early period gave her chief attention to elocution and acting. Her voice, though deep and powerful, was at first hard and inflexible; and her thin and meagre appearance conveyed an impression of insignificance, which her plain features and generally impassive manner tended to confirm. It was only her remarkable intelligence that encouraged her instructors to persevere; but even they did not recognize her talents as exceptional. She made her first appearance at the Gymnase in the *Vendéenne* in 1837 with only mediocre success. On 12th June of the following year she succeeded, after great difficulty, in making a début at the Théâtre Français, appearing as Camille in *Les Horaces*, when, attention having been directed to her remarkable genius by Jules Janin in the *Débats* and Madame de Girardin in the *Presse*, it at once received universal recognition. Her range of characters was limited, but within this range she was unsurpassable. It was especially in the tragedies of Racine and Corneille that she excelled, and more particularly in the impersonation of evil or malignant passion. By careful training her originally hard and harsh voice had become flexible and melodious, and its low and muffled notes under the influence of passion possessed a thrilling and penetrating quality that was irresistible. When excited her plain features became transfigured by the glow of genius, and in her impersonations of evil and malignant emotions there was a majesty and dignity which fascinated whilst it repelled. Her facial elocution was unsurpassable in variety and expressiveness, whilst the grace of her gestures and the marvellous skill with which she varied her tones with every shade of thought and emotion were completely beyond criticism. It was, however, the predominance of intellect and will rather than the perfection of her art that most specially characterized her impersonations and conferred on them their unique excellence. She appeared successively as Émilie in *Cinna*, Hermione in *Andromaque*, Ériphile in *Iphigénie*, Monime in *Mithridate*, and Aménaïde in *Tancrède*; but it was in *Phèdre*, which she first played on 21st January 1843, that her peculiar gifts were most strikingly manifested. In modern plays she created the characters of Judith and Cleopatra in the tragedies of Madame de Girardin, but her most successful appearance was in 1849 in *Adrienne Lecouvreur*. In 1840 she visited London, where her interpretations of Corneille and Racine were the sensation of the season. She also played successively in the principal capitals of Europe. In 1855 she made a tour in the United States with comparatively small success. This was, however, after her powers through continued ill-health had begun to deteriorate. She died of consumption at Cannet, near Cannes, on 4th January 1858.

RACINE, a city of the United States, the county seat of Racine county, Wisconsin, lies 23 miles by rail south of Milwaukee, and occupies a plateau projecting for about 6 miles into Lake Michigan, 40 feet above its level. The town is the seat of extensive manufacturing industries—producing carriages, waggon, ploughs, threshing-machines, portable steam-engines, fanning-mills, leather, blinds and sashes, school furniture, wire, linseed oil, baskets, &c.—is engaged in the lumber trade and general commerce, and contains two city hospitals, an orphan asylum, Racine (Episcopalian) college founded in 1852, and a Roman Catholic academy. The harbour is open to vessels drawing 15 feet. Racine, first settled in 1834, was incorporated in 1848, four years after the first steamer had entered the port. The population was 7822 in 1860, 9880 in 1870, and 16,031 in 1880.

RACINE, JEAN (1639-1699), the most equal and accomplished, if not the greatest, tragic dramatist of France, was born at La Ferté Milon in the old duchy of Valois in the month of December 1639. The 20th and the two follow-

ing days of the month are variously given as his birthday ; all that is certain is that he was christened on the 22d. The ceremony was at that time often, though not invariably, performed on the day of birth. Racine belonged to a family of the upper bourgeoisie, which had indeed been technically ennobled some generations earlier and bore the punning arms of a rat and a swan (*rat, cygne*). The poet himself subsequently dropped the rat. His family were connected with others of the same or a slightly higher station in La Ferté and its neighbourhood,—the Des Moulins, the Sconins, the Vitarts, all of whom appear in Racine's life. His mother was Jeanne Sconin. His father, of the same name as himself, was only four-and-twenty at the time of the poet's birth. He seems to have been a solicitor (*procureur*) by profession, and held, as his father, the grandfather of the dramatist, had done, the office of *controleur au grenier à sel*. Racine was the eldest child of his parents. Little more than a year afterwards his sister Marie was born and his mother died. Jean Racine the elder married again, but three months later he himself died and the stepmother is never heard of in connexion with the poet or his sister. They were left without any provision, but their grandparents, Jean Racine the eldest and Marie des Moulins, were still living, and took charge of them. These grandparents had a daughter, Agnes, who figures in Racine's history. She was a nun of Port Royal under the style of Mère de Sainte Thècle, and the whole family had strong Jansenist leanings. Jean Racine the eldest died in 1649, and, apparently as a consequence of this, the poet was sent to the Collège de Beauvais. This (which was the grammar-school of the town of that name, and not the famous Collège de Beauvais at Paris) was intimately connected with Port Royal, and to this latter place Racine was transferred in November 1655. His special masters there were Nicole and Le Maître. The latter, in an extant letter written to his pupil during one of the gusts of persecution which Port Royal constantly suffered, speaks of himself as "votre papa"; the manner in which Racine repaid this affection will be seen shortly. It is evident from documents that he was a very diligent student both at Beauvais and Port Royal. He wrote verse both in Latin and French, and his Port Royal odes, which it has been the fashion with the more fanatical admirers of his later poetry to ridicule, are far from despicable. They show the somewhat garrulous nature-worship of the Pléiade tempered by the example of the earlier school of Malherbe. He seems also to have made at least a first draft of his version of the breviary hymns; some, if not most, of a considerable mass of translations from the classics and annotations on them must also date from this time. Racine stayed at Port Royal for three years, and left it, aged nearly nineteen, in October 1658. He was then entered at the Collège d'Harcourt and boarded with his second cousin, Nicolas Vitart, steward of the duke of Luynes. Later, if not at first, he lived in the Hôtel de Luynes itself. It is to be observed that his Jansenist surroundings continued with him here, for the duke of Luynes was a severe Port Royalist. It is, however, clear from Racine's correspondence, which as we have it begins in 1660 and is for some years very abundant and interesting, that he was not at all of an austere disposition at this time. His chief correspondent is a certain young abbé Le Vasseur, who seems to have been by no means seriously given. The letters are full of verse-making and of other diversions; a certain Mademoiselle Lucrèce, who seems to have been both amiable and literary, is very frequently mentioned, neither is she the only one of her sex who appears. Occasionally the liveliness of the letters passes the bounds of strict decency, though there is nothing very shocking in them.

Those to Madame (or, as the habit of the time called her, Mademoiselle) Vitart are free from anything of this kind, while they are very lively and pleasant. It does not appear that Racine read much philosophy, as he should have done, but he occasionally did some business in superintending building operations at Chevreuse, the duke's country house. He would seem, however, to have been already given up irrevocably to literature. This by no means suited the views of his devout relations at Port Royal, and he complains in one of his letters that an unlucky sonnet on Mazarin had brought down on him "excommunications sur excommunications." But he had much more important works in hand than sonnets. The marriage of Louis XIV. was the occasion of an ambitious ode, "*La Nymphé de la Seine*," which was submitted before publication to Chapelain, the too famous author of the *Pucelle*. Chapelain's fault was not ill-nature, and he made many suggestions (including the very pertinent one that Tritons were not usually found in rivers), which Racine duly adopted. Nor did the ode bound his ambitions, for he finished one piece, *Amasie*, and undertook another, *Les Amours d'Ovide*, for the theatre. The first, however, was rejected by the actors of the Marais, and it is not certain that the other was ever finished or offered to those of the Hôtel de Bourgogne. Racine's letters show that he was intimate with more than one actress at this time; he also made acquaintance with La Fontaine, and the foundations at any rate of the legendary "society of four" (Boileau, La Fontaine, Molière, and Racine) were thus laid.

His relations were pretty certainly alarmed by this very pardonable worldliness, though a severe expostulation with him for keeping company with the abominable actors is perhaps later in date. Allusions in a letter to his sister leave little doubt of this. Racine was accordingly disturbed in his easy-going life at Paris. In November 1661 he went to Uzès in Languedoc to live with his uncle the Père Sconin, vicar-general of that diocese, where it was hoped that Sconin would be able to secure a benefice for his nephew. It is certain that he was not slack in endeavouring to do this, but his attempts were in vain, and perhaps the church did not lose as much as the stage gained. Racine was at Uzès for an uncertain time. All that is known is that he was back in Paris before the end of 1663. His letters from Uzès to La Fontaine, to Le Vasseur, and others are in much the same strain as before, but there is here and there a marked tone of cynicism in them. One passage in particular, in which he tells how he was disenchanted with a damsel of Uzès, has an unpleasantly Swiftian touch about it. Once back in Paris, he gave himself up entirely to letters with a little courtiership. An ode on the recovery of Louis XIV. from a slight illness probably secured him the promise of a pension, of which he speaks to his sister in the summer of 1664, and on 22d August he actually received it. It is uncertain whether this pension is identical with "gratifications" which we know that Racine for some years received and which were sometimes eight and sometimes six hundred livres. It would seem not, as one of these gratifications had been allotted to him the year before he so wrote to his sister. All this shows that he had already acquired some repute as a promising novice in letters, though he had as yet done nothing substantive. The ode in which he thanked the king for his presents, "*La Renommée*," is said to have introduced him to Boileau, to whose censorship there is no doubt that he owed much, if not everything; and from this date, November 1663, the familiarity of "the four" undoubtedly existed in full force. Racine was at the time the least distinguished, but he rapidly equalled, if not the merit, the reputation of his friends. Unfortunately it is precisely at this date that his corre-

spondence ceases, and it is not renewed till after the close of his brief but brilliant career as a dramatist (*Esther* and *Athalie* excepted). This is the more to be regretted in that the most disputable events of Racine's life as well as the greater part of his literary work fall within this silent period. His strange behaviour to Molière, his virulent attack on his masters and friends of Port Royal, and the sudden change by which, after the failure of *Phèdre* and for no clearly expressed cause, a man of pleasure and an active literary worker became a sober domestic character of almost ostentatiously religious habits, and abstained from almost all but official work, are unilluminated by any words of his own. From this time forward the gossip of the period and the *Life* by his son Louis are the chief sources of information. Unfortunately Louis Racine, though a man of some ability and of unimpeached character, was only six years old when his father died, and had no direct knowledge. Still his account represents family papers and traditions and seems to have been carefully, as it is certainly in the main impartially, written. From other sources—notably Boileau, Brossette, and Valincourt—a good deal of pretty certainly authentic information is obtainable, and there exists a considerable body of correspondence between Boileau and the poet during the last ten years of Racine's life.

The first but the least characteristic of the dramas by which Racine is known, *La Thébaine*, was finished by the end of 1663, and on Friday 20th June 1664 it was played by Molière's company at the Palais Royal theatre. Some editors assert that Molière himself acted in it, but the earliest account of the cast we have, and that is sixty years after date, omits his name, though those of Madeleine Béjard and Mademoiselle de Brie occur. There is a tradition, supported by very little evidence, that Molière suggested the subject; on the other hand, Louis Racine distinctly says that his father wrote most of the play at Uzès before he knew Molière. Racine's own letters, which cover the period of composition, though not that of representation, give little help in deciding this not very important question, except that it appears from them that the play was designed for the rival theatre, and that "*La Déhanchée*," Racine's familiar name for Mademoiselle de Beauchâteau, with whom he was intimate, was to play Antigone. The play itself is by far the weakest of Racine's works. He has borrowed much from Euripides and not a little from Rotrou; and in his general style and plan he has as yet struck out no great variation from Corneille. We have very little intelligence about the reception of the piece. It was acted twelve times during the first month, which was for the period a very fair success, and was occasionally revived during the year following.

This is apparently the date of the pleasant picture of the four friends which La Fontaine draws in his *Psyche*, Racine figuring as Acante, "*qui aimait extrêmement les jardins, les fleurs, les ombrages*." Various stories, more or less mythical, also belong to this period; the best authenticated of them contributes to the documents for Racine's unamiable temper. He had absolutely no reason to complain of Chapelain, who had helped him with criticism, obtained royal gifts for him, and, in a fashion, started him in the literary career, yet he helped in composing the lampoon of *Chapelain décoiffé*. The sin would not be unpardonable if it stood alone, but unluckily a much graver one followed.

We have no definite details as to Racine's doings during the year 1664, but in February 1665 he read at the Hôtel de Nevers before La Rochefoucauld, Madame de la Fayette, Madame de Sévigné, and other scarcely less redoubtable judges the greater part of his second acted play, *Alexandre le Grand*, or, as Pemponne (who tells the fact) calls it, *Porus*.

This was a frequent kind of preliminary advertisement at the time, and it seems, as we find from the rhymed gazettes, to have been successful. It was anxiously expected by the public, and Molière's company played it on 4th December,—Monsieur, his wife Henrietta of England, and many other distinguished persons being present. The gazetteer Subigny vouches for its success, and the still more certain testimony of the accounts of the theatre shows that the receipts were good and, what is more, steady. But a fortnight afterwards *Alexandre* was played, "*de complot avec M. Racine*," says La Grange, by the rival actors (who had four days before performed it in private) at the Hôtel de Bourgogne. A vast amount of ink has been spilt on this question, but no one has produced any valid justification for Racine. That the piece failed at the Palais Royal is demonstrably false, and as this is stated in the earliest attempt to excuse Racine, and the only one made in his lifetime, it is pretty clear that his case was very weak. His son simply says that he was "*mécontent des acteurs*," which indeed is self-evident. It is certain that Molière and he ceased to be friends in consequence of this proceeding; and that Molière was in fault no one who has studied the character of the two men, no one even who considers the probabilities of the case, will easily believe. If, however, *Alexandre* was the occasion of showing the defects of Racine's character as a man, it raised him vastly in public estimation as a poet. He was now for the first time proposed as a serious rival to Corneille. There is a story, which a credible witness vouches for as Racine's own, that he read the piece to the author of the *Cid* and asked his verdict. Corneille praised the piece highly, but not as a drama, "*Il l'assurait qu'il n'était pas propre à la poésie dramatique*." There is no reason for disbelieving this, for the character of Alexander could not fail to shock Corneille, and he was notorious for not mincing his words. Nor can it be denied that Racine might have been justly hurt, though with a man of more amiable temper the slight would hardly have caused the settled antagonism to Corneille which he displayed. The contrast between the two even at this early period was accurately apprehended and put by Saint Evremond in his masterly *Dissertation sur l'Alexandre*, but this was not published for a year or two. To this day it is the best criticism of the faults of Racine, though not, it may be, of the merits, which had not yet been fully seen. It may be added that in the preface of the printed play the poet showed the extreme sensitiveness to criticism which perhaps excuses, and which certainly often accompanies, a tendency to criticize others. These defects of character showed themselves still more fully in another matter. The Port Royalists, as has been said, detested the theatre, and in January 1666 Nicole, their chief writer, spoke in one of his *Lettres sur Visionnaires* of dramatic poets as "*empoisonneurs publics*." There was absolutely no reason why Racine should fit this cap on his own head; but he did so, and published immediately a letter to the author. It is very smartly written, and if Racine had contented himself with protesting against the absurd exaggeration of the decriers of the stage there would have been little harm done. But he filled the piece with personalities, telling an absurd story of Mère Angélique Arnauld's supposed intolerance, drawing a ridiculous picture of Le Maître (a dead man and his own special teacher and friend), and sneering savagely at Nicole himself. The latter made no reply, but two lay adherents of Port Royal took up the quarrel with more zeal than discretion or ability. Racine wrote a second pamphlet as bitter and personal as the first, but less amusing, and was about to publish it when fortunately Boileau, who had been absent from Paris, returned and protested against the publication. It remained accordingly unprinted till after the author's death, as well as a

preface to both which he had prepared with a view to publishing them together. In this respect Boileau was certainly Racine's good angel, for no one has ventured to excuse the tone of these letters. The best excuse for them is that they represent the accumulated resentment arising from a long course of "excommunications."

After this disagreeable episode Racine's life for ten years and more becomes simply the history of his plays, if we except his liaisons with the actresses Mademoiselle du Parc and Mademoiselle de Champmeslé (which are undoubted, though there is not much to be said about them) and his election to the Academy on 17th July 1673. Mademoiselle du Parc (Marquise de Gorla) was no very great actress, but was very beautiful, and she had previously captivated Molière. Racine induced her to leave the Palais Royal company and join the Hôtel. She died in 1668, and long afterwards the infamous Voisin accused Racine of having poisoned her. Mademoiselle de Champmeslé was plain and stupid, but an admirable actress and apparently very attractive in some way, for not merely Racine but Charles de Sévigné and many others adored her. She was cruel to none, but for five years before his marriage Racine seems to have been her *amant en titre*. Long afterwards, just before his own death, he heard of her mortal illness and speaks of her to his son without a flash of tenderness.

The series of his dramatic triumphs began with *Andromaque*, and this play may perhaps dispute with *Phèdre* and *Athalie* the title of his masterpiece. It is much more uniformly good than *Phèdre*, and the character of Hermione is the most personally interesting on the French tragic stage. It is said that the first representation of *Andromaque* was on 10th November 1667, in public and by the actors of the Hôtel de Bourgogne, but the first contemporary mention of it by the gazettes, prose and verse, is on the 17th, as performed in the queen's apartment. Perrault, by no means a friendly critic as far as Racine is concerned, says that it made as much noise as the *Cid*, and so it ought to have done. Whatever may be thought of the *tragédie pathétique* (a less favourable criticism might call it the "sentimental tragedy"), it could hardly be better exemplified than in this admirable play. A ferocious epigram of Racine's own (an epigram not unworthy of Martial, and as difficult to comment on to modern ears polite as some of Martial's own) tells us that some critics thought Pyrrhus too fond of his mistress, and Andromache too fond of her husband, which is not likely to be the present verdict. In the contemporary depreciations is to be found the avowal of its real merit. The interest was too varied, the pathos too close to human nature to content Boileau, and the partisans of Corneille still found Racine unequal to the heroic height of their master's grandeur. A just criticism will probably hold that these two objections neutralize each other. Both parties agreed in saying that much of the success was due to the actors, another censure which is equivalent to praise. It so happens, too, that, though the four main parts were played by accomplished artists, two at least of them were such as to try those artists severely. Pyrrhus was taken by Floridor, the best tragic actor by common consent of his time, and Orestes by Montfleury, also an accomplished player. But Mademoiselle du Parc, who played Andromache, had generally been thought below, not above, her parts, and Mademoiselle des Oeillets, who played the difficult rôle of Hermione, was old and had few physical advantages. No one who reads *Andromaque* without prejudice is likely to mistake the secret of its success, which is, in few words, the application of the most delicate art to the conception of really tragic passion. Before leaving the play it may be mentioned that it is said to have been in the part of Hermione, three

years later, that Mademoiselle de Champmeslé captivated the author. *Andromaque* was succeeded, at the distance of not more than a year, by a play which, taken in conjunction with his others, is perhaps the best proof of the theatrical talent of Racine,—the charming comediotta of *Les Plaideurs*. We do not know exactly when it was played, but it was printed on 5th December 1668, and it had succeeded so badly that doubtless no long time passed between its appearance on the stage and in print. For the printing at that time both in France and England made the play *publica materies*, and therefore in the case of very successful pieces it was put off as long as possible. Many anecdotes are told about the origin and composition of *Les Plaideurs*. The *Wasps* of Aristophanes and the known fact that Racine originally destined it, not for a French company, but for the Italian troupe which was then playing the *Commedia dell'Arte* in Paris dispense us from enumerating them. The result is a piece admirably dramatic, but sufficiently literary to shock the *profanum vulgus*, which too frequently gives the tone at theatres. It failed completely, the chief favouring voice being, according to a story sufficiently well attested and worthy of belief even without attestation, that of the man who was best qualified to praise and who might have been most tempted to blame of any man then living. Molière, says Valincourt, the special friend of Racine, said in leaving the house, "Que ceux qui se moquoient de cette pièce meritoient qu'on se moquoient d'eux." But the piece was suddenly played at court a month later; the king laughed, and its fortunes were restored. The truth probably was that the legal profession, which was very powerful in the city of Paris, did not fancy the most severe satire on its ways which had been made public since the *or ça* of the fifth book of Rabelais. It need only be added that, if Louis XIV. admired *Les Plaideurs*, Napoleon did not, and excluded it from his travelling library. It was followed by a very different work, *Britannicus*, which appeared on 13th December 1669. It was much less successful than *Andromaque*, and, whether or not the cabals, of which Racine constantly complains, and which he certainly did nothing to disarm, had anything to do with this, it seems to have held its own but a very few nights. Afterwards it became very popular, and even from the first the exquisite versification was not denied. But there is no doubt that in *Britannicus* the defects of Racine, which in his first two plays were excusable on the score of apprenticeship, and in the next two hardly appeared at all, display themselves pretty clearly to any competent critic. The complete nullity of *Britannicus* and Junie and the insufficient attempt to display the complex and dangerous character of Nero are not redeemed by Agrippina, who is really good, and Burrhus, who is solidly painted as a secondary character. Voltaire calls it "la pièce des connaisseurs," and the description is—not quite in the sense in which the critic meant it—a very pregnant one. *Britannicus* is eminently the piece in which persons of a dilettante turn are seduced by the beauties which do exist to discover those which do not. The next play of Racine has, except *Phèdre*, the most curious history of all. "*Bérénice*," says Fontenelle succinctly, "fut un duel," and he acknowledges that his uncle was not the conqueror. Henrietta of Orleans proposed (it is said without letting them know the double commission) the subject to Corneille and Racine at the same time, and rumour gives no very creditable reasons for her choice of the subject. Her death, famous for its disputed causes and for Bossuet's sermon, preceded the performance of the two plays, both of which, but especially Racine's, were successful. There is no doubt that it is the better of the two, but Chapelle's not unfriendly criticism in quoting the two lines of an old song—

"Marion pleure, Marion crie,
Marion veut qu'on la marie"—

is said to have annoyed Racine very much, and it has a most malicious appropriateness. *Bajazet*, which was first played on 4th January 1672 (for Racine punctually produced his piece a year), is perhaps better. As a play, technically speaking, it has great merit, but the reproach commonly brought against its author was urged specially and with great force against this by Corneille. It is impossible to imagine anything less Oriental than the atmosphere of *Bajazet*; the whole thing is not only French but ephemerally French—French of the day and hour; and its ingenious scenario and admirable style scarcely save it. This charge is equally applicable with the same reservations to *Mithridate*, which appears to have been produced on 13th January 1673, the day after the author's reception at the Academy. It was extremely popular and, as far as style and perfection in a disputable kind go, Racine could hardly have lodged a more triumphant diploma piece. His next attempt, *Iphigénie*, was a long step backwards and upwards in the direction of *Andromaque*. It is not that the characters are eminently Greek, but that Greek tragedy gave Racine examples which prevented him from flying in the face of the propriety of character as he had done in *Bérénice*, *Bajazet*, and *Mithridate*, and that he here called in, as in *Andromaque*, other passions to the aid of the mere sighing and crying which form the sole appeal of these three tragedies. Achilles is a rather pitiful personage, and the grand story of the sacrifice is softened very tamely to suit French tastes; but the parental agonies of Clytemnestra and Agamemnon are truly drawn, and the whole play is full of pathos. It succeeded brilliantly and deservedly, but, oddly enough, the date of its appearance is very uncertain. It was assuredly acted at court in the late summer of 1674, but it does not seem to have been given to the public till the early spring of 1675, the usual time at which Racine produced his work.

The last and finest of the series of tragedies proper was the most unlucky. *Phèdre* was represented for the first time on New-Year's Day 1677 at the Hôtel de Bourgogne. Within a week the opposition company or "troupe du roi" launched an opposition *Phèdre* by Pradon. This singular competition, which had momentous results for Racine, and in which he to some extent paid the penalty of the *lex talionis* for his own rivalry with Corneille, had long been foreseen. It has been hinted that Racine had from the first been bitterly opposed by a clique, whom his great success irritated, while his personal character did nothing to conciliate them. His enemies at this time had the powerful support of the duchess of Bouillon, one of Mazarin's nieces, a woman of considerable talents and imperious temper, together with her brother the duke of Nevers and divers other personages of high position. These persons of quality, guided, it is said, by Madame Deshoulières, a poetess of merit whom Boileau unjustly depreciated, selected Pradon, a dramatist of little talent but of much facility, to compose a *Phèdre* in competition with that which it was known that Racine had been elaborating with unusual care. Pradon, perhaps assisted, was equal to the occasion, and it is said that the partisans on both sides did not neglect means for correcting fortune. On her side the duchess of Bouillon is accused of having bought up the front places in both theatres for the first six nights; on his part Racine is said to have repeated an old trick of his and prevailed on the best actresses of the company that played Pradon's piece to refuse the title part. There is even some ground for believing that Racine endeavoured to prevent the opposition play from being played at all, and that an express order from the king had to be obtained for it. It was of

no value, but the measures of the cabal had been so well taken that the finest tragedy of the French classical school was all but driven from the stage, while Pradon's was a positive success. A war of sonnets and epigrams followed, during which it is said that the duke of Nevers menaced Racine and Boileau with the same treatment which Dryden and Voltaire actually received, and was only deterred by the protection which Condé extended to them.

The unjust cabal against his piece and the various annoyances to which it gave rise no doubt made a deep impression on Racine. But in the absence of accurate contemporary information it is impossible to decide exactly how much influence they had on the subsequent change in his life. For thirteen years he had been constantly employed on a series of brilliant dramas. He now broke off his dramatic work entirely and in the remaining twenty years of his life wrote but two more plays, and those under special circumstances and of quite a different kind. He had been during his early manhood a libertine in morals and religion; he now married, became irreproachably domestic, and almost ostentatiously devout. No authentic account of this change exists; for that of Louis Racine, which attributes the whole to a sudden religious impulse, is manifestly little more than the theory of a son pious in both senses of the word. Probably all the motives which friends and foes have attributed—weariness of dissipated life, jealousy of his numerous rivals in Mademoiselle de Champmeslé's favour, pique at Pradon's success, fear of losing still further the position of greatest tragic poet which after Corneille's *Surena* was indisputably his, religious sentiment, and so forth—entered more or less into his action. At any rate what is certain is that he reconciled himself with Arnauld and Port Royal generally, and on 1st June married Catherine de Romanet and definitely settled down to a quiet domestic life, alternated with the duties of a courtier. For his repentance was by no means a repentance in sackcloth and ashes. The drama was not then very profitable to dramatists, but Louis Racine tells us that his father had been able to furnish a house, collect a library of some value, and save 6000 livres. His wife had money, and he had possessed for some time (it is not certain how long) the honourable and valuable post of treasurer of France at Moulins. His annual "gratification" had been increased from 800 to 1500 livres, then to 2000, and in the October of the year of his marriage he and Boileau were made historiographers-royal with a salary of 2000 crowns. Besides all this he had, though a layman, one or two benefices. It would have been pleasanter if Louis Racine had not told us that his father regarded His Majesty's choice as "an act of the grace of God to detach him entirely from poetry." Even after allowing for Louis Racine's religiosity and the conventional language of all times, there is a flavour of hypocrisy about this which is disagreeable, and has shocked even Racine's most uncompromising admirers. For the historiographer of Louis XIV. was simply his chief flatterer. Before going further it may be observed that very little came of this historiography. The joint incumbents of the office made some campaigns with the king, sketched plans of histories, and left a certain number of materials and memoirs; but they executed no substantive work. Racine, whether this be set down to his credit or not, was certainly a fortunate and apparently an adroit courtier. His very relapse into Jansenism coincided with his rise at court, where Jansenism was in no favour, and the fact that he had been in the good graces of Madame de Montespan did not deprive him of those of Madame de Maintenon. Neither in *Esther* did he hesitate to reflect upon his former patroness. But a reported sneer of the king, who was sharp-eyed enough, "Cavoie avec Racine se croit bel esprit; Racine avec Cavoie

se croit courtisan," makes it appear that his comparatively low birth was not forgotten at Versailles.

Racine's first campaign was at the siege of Ypres in 1678, where some practical jokes are said to have been played on the two civilians who acted this early and peculiar variety of the part of special correspondent. Again in 1683, in 1687, and in each year from 1691 to 1693 Racine accompanied the king on similar expeditions. The literary results of these have been spoken of. His labours brought him, in addition to his other gains, frequent special presents from the king, one of which was as much as 1000 pistoles. In 1690 he further received the office of "gentilhomme ordinaire du roi," which afterwards passed to his son. Thus during the later years of his life he was more prosperous than is usual with poets. His domestic life appears to have been a happy one. Louis Racine tells us that his mother "did not know what a verse was," but Racine certainly knew enough about verses for both. They had seven children. The eldest, Jean Baptiste, was born in 1678; the youngest, Louis, in 1692. It has been said that he was thus too young to have many personal memories of his father, but he tells one or two stories which show Racine to have been at any rate a man of strong family affection, as, moreover, his letters prove. Between the two sons came five daughters, Marie, Anne, Elizabeth, Françoise, and Madeleine. The eldest, after showing "vocation," married in 1699, Anne and Elizabeth took the veil, the youngest two remained single but did not enter the cloister. To complete the notice of family matters—much of Racine's later correspondence is addressed to his sister Marie, Madame Rivière.

The almost complete silence in the literary sphere which Racine imposed on himself after the comparative failure, shameful not for himself but for his adversaries, of *Phèdre* was broken once or twice even before the appearance of the two exquisite tragedies in which under singular circumstances he took leave of the stage. The most honourable of these was the reception of Thomas Corneille on 2d January 1685 at the Academy in the room of his brother. The discourse which Racine then pronounced turned almost entirely on his great rival, of whom he spoke even more than becomingly. But it was an odd conjunction of the two reigning passions of the latter part of his life—devoutness and obsequiousness to the court—which made him once more a dramatist. Madame de Maintenon had established an institution, first called the Maison Saint Louis, and afterwards (from the place to which it was transferred) the Maison de Saint Cyr, for the education of poor girls of noble family. The tradition of including acting in education was not obsolete. At first the governess, Madame de Grinon, composed pieces for representation, but, says Madame de Caylus, a witness at first hand and a good judge, they were "detestable." Then recourse was had to chosen plays of Corneille and Racine, but here there were obvious objections. The favourite herself wrote to Racine that "nos petites filles" had played *Andromaque* "a great deal too well." She asked the poet for a new play suited to the circumstances, and, though Boileau advised him against it, it is not wonderful that he yielded. The result was the masterpiece of *Esther*, with music by Moreau, the court composer and organist of Saint Cyr. Although played by schoolgirls and in a dormitory, it had an enormous success, in which it may be charitably hoped that the transparent comparison of the patroness to the heroine had not too much to do. Printed shortly afterwards, it had to suffer a certain reaction, or perhaps a certain vengeance, from those who had not been admitted to the private stage. But no competent judge could hesitate. Racine probably had read and to some extent followed the *Aman* of Montchrestien, but he made of it only the use

which a proved master in literature has a perfect right to make of his forerunners. The beauty of the chorus, which Racine had restored more probably from a study of the *Pléiade* tragedy than from classical suggestions, the perfection of the characters, and the wonderful art of the whole piece need no praise. Almost immediately the poet was at work on another and a still finer piece of the same kind, and he had probably finished *Athalie* before the end of 1690. The fate of the play, however, was very different from that of *Esther*. Some fuss had been made about the worldliness of great court fêtes at Saint Cyr, and the new play, with settings as before by Moreau, was acted both at Versailles and at Saint Cyr with much less pomp and ceremony than *Esther*. It was printed in March 1691 and the public cared very little for it. The truth is that the last five-and-twenty years of the reign of Louis XIV. were marked by one of the lowest tides of literary accomplishment and appreciation in the history of France. The just judgment of posterity has ranked *Athalie*, if not as Racine's best work (and there are good grounds for considering it to be this), at any rate as equal to his best. Thenceforward Racine was practically silent, except for four *cantiques spirituelles*, in the style and with much of the merit of the choruses of *Esther* and *Athalie*. The general literary sentiment led by Fontenelle (who inherited the wrongs of Corneille, his uncle, and whom Racine had taken care to estrange further) was against the arrogant critic and the irritable poet, and they made their case worse by espousing the cause of La Bruyère, whose personalities in his *Caractères* had made him one of the best hated men in France, and by engaging in the ancient and modern battle with Perrault. Racine, moreover, was a constant and spiteful epigrammatist, and the unlucky habit of preferring his joke to his friend stuck by him to the last. A savage epigram on the *Sesostris* of Longepierre, who had done him no harm and was his familiar acquaintance, dates as late as 1695. Still the king maintained him in favour, and so long as this continued he could afford to laugh at Grub Street and the successors of the Hôtel de Rambouillet alike. At last, however, there seems (for the matter is not too clear) to have come a change. Some say that he disoblinded Madame de Maintenon, some (and this would be much to his honour, but not exactly in accord with anything else known of him) that, like Vauban and Fénelon, he urged the growing misery of the people. But there seems to be little doubt of the fact of the royal displeasure, and it is even probable that it had some effect on his health. Disease of the liver appears to have been the immediate cause of his death, which took place on 12th April 1699. The king seems to have, at any rate, forgiven him after his death, and he gave the family a pension of 2000 livres. Racine was buried at Port Royal, but even this transaction was not the last of his relations with that famous home of religion and learning. After the destruction of the abbey in 1711 his body was exhumed and transferred to Saint Étienne du Mont, his gravestone being left behind and only restored to his ashes a hundred years later, in 1818. His eldest son was never married; his eldest daughter and Louis Racine have left descendants to the present day.

A critical biography of Racine is, in more ways than one, an exceptionally difficult undertaking,—not in regard to the facts, which, as will have been seen, are fairly abundant, but as to the construction to be placed on them. The admirers of Racine's literary genius have made it a kind of religion to defend his character; and strictures on his character, it seems to be thought, imply a desire to depreciate his literary worth. The reader of the above sketch of his life must judge for himself whether Racine is or is not to be ranked with those great men of letters, fortunately the greater number, whose personality is attractive and their foibles at worst excusable. There is no doubt that the general impression given, not merely by the flying anecdotes of the time, but by ascertained facts, is somewhat unfavourable. Racine's affection for his family

and his unbroken friendship for Boileau are the sole points of his life which are entirely creditable to him. His conduct to Molière and to Nicole cannot be excused; his attitude towards his critics and his rivals was querulous and spiteful; his relation to Corneille contrasts strikingly with the graceful position which young men of letters, sometimes by no means his inferiors, have often taken up towards the surviving glories of a past generation; his "conversion," though there is no just cause for branding it as hypocritical, appears to have been a singularly accommodating one, enabling him to tolerate adultery, to libel his friends in secret, and to flatter greatness unhesitatingly. None of these things perhaps are very heinous crimes, but they are all of the class of misdoing which, fairly or unfairly, mankind are apt to regard with greater dislike than positive misdeeds of a more glaring but less unheroic character.

The personality of an author is, however, by all the laws of the saner criticism, entirely independent of the rank to be assigned to his work, and, as in other cases, the strongest dislike for the character of Racine as a man is compatible with the most unbounded admiration of his powers as a writer. But here again his injudicious admirers have interposed a difficulty. There is a theory common in France, and sometimes adopted out of it, that only a Frenchman, and not every Frenchman, can properly appreciate Racine. The charm of his verse and of his dramatic presentation is so esoteric and delicate that foreigners cannot hope to taste it. This is of course absurd, and if it were true it would be fatal to Racine's claims as a poet of the highest rank. Such poets, such writers, are not parochial or provincial, and even the greatest nations are but provinces or parishes in the realm of literature. Homer, Shakespeare, Dante, even Molière, Rabelais, Goethe, are not afraid to challenge the approval of the whole world, and the whole world is not found incompetent or unwilling to give it. Nor need Racine in reality avail himself of this unwise pretension. Judged by the common tests of literature he is a consummate artist, but he is scarcely a great poet, for his art, though unsurpassed in its kind, is narrow in range and his poetry is neither of the highest nor of the most genuine.

He may be considered from two very different points of view,—(1) as a playwright and poetical artificer, and (2) as a dramatist and a poet. From the first point of view there is hardly any praise too high for him. He did not invent the form he practised, and those who, from want of attention to the historical facts, assume that he did are unskilful as well as ignorant. When he came upon the scene the form of French plays was settled, partly by the energetic efforts of the Pléiade and their successors, partly by the reluctant acquiescence of Corneille. It is barely possible that the latter might, if he had chosen, have altered the course of French tragedy; it is nearly certain that Racine could not. But Corneille, though he was himself more responsible than any one else for the acceptance of the single-situation tragedy, never frankly gave himself up to it, and the inequality of his work is due to this. His heart was, though not to his knowledge, elsewhere, and with Shakespeare. Racine, in whom the craftsman dominated the man of genius, worked with a will and without any misgivings. Every advantage which the Senecan tragedy adapted to modern times was capable of he gave it. He perfected its versification; he subordinated its scheme entirely to the one motive which could have free play in it,—the display of a conventionally intense passion; he set himself to produce in verse a kind of Ciceronian correctness. The grammar criticisms of Vaugelas and the taste criticisms of Boileau produced in him no feeling of revolt, but only a determination to play the game according to these new rules with triumphant accuracy. And he did so play it. He had supremely the same faculty which enabled the rhetoricians of the 15th century to execute apparently impossible tours de force in ballades couronnées, and similar tricks. He had besides a real and saving vein of truth to nature, which preserved him from tricks pure and simple. He would be and he was as much a poet as prevalent taste would let him be. The result is that such plays as *Phèdre* and *Andromaque* are supreme in their own way. If the critic will only abstain from thrusting in fierce, when according to the particular rules he ought to thrust in quart, Racine is sure to beat him.

But there is a higher game of criticism than this, and this game Racine does not attempt to play. He does not even attempt the highest poetry at all. His greatest achievements in pure passion—the foiled desires of Hermione and the jealous frenzy of *Phèdre*—are cold, not merely beside the crossed love of Ophelia and the remorse of Lady Macbeth, but beside the sincerer if less perfectly expressed passion of Corneille's *Cléopâtre* and *Camille*. In men's parts he fails still more completely. As the decency of his stage would not allow him to make his heroes frankly heroic, so it would not allow him to make them utterly passionate. He had, moreover, cut away from himself by the adoption of the Senecan model all the opportunities which would have been offered to his remarkably varied talent on a freer stage. It is indeed tolerably certain that he never could have achieved the purely poetical comedy of *As You Like It* or the *Vida as Suena*, but the admirable success of *Les Plaideurs* makes it at least probable that he might have done something in a lower and a more conventional style. From all this,

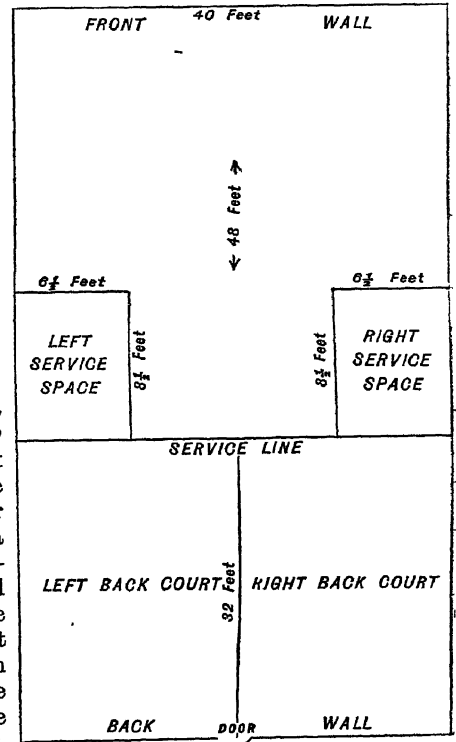

however, he deliberately cut himself off. Of the whole world which is subject to the poet he took only a narrow artificial and conventional fraction. Within these narrow bounds he did work which no admirer of literary craftsmanship can regard without admiration. But at the same time no one speaking with competence can deny that the bounds are narrow. It would be unnecessary to contrast his performances with his limitations so sharply if those limitations had not been denied. But they have been and are still denied by persons whose sentence carries weight, and therefore it is still necessary to point out the fact of their existence.

Nearly all Racine's works are mentioned in the above notice. There is here no room for a bibliographical account of their separate appearances. The first collected edition was in 1675-76, and contained the nine tragedies which had then appeared. The last and most complete which appeared in the poet's lifetime (1697) was revised by him, and contains the dramas and a few miscellaneous works. Like the *éditio princeps*, it is in 2 vols. 12mo. The posthumous editions are innumerable and gradually became more and more complete. The most noteworthy are the Amsterdam edition of 1722; that by Abbé d'Olivet, also at Amsterdam, 1743; the Paris quarto of 1760; the edition of Lueau de Boisjerman, Paris and London, 1768; the magnificent illustrated folios of 1805 (Paris); the edition of Germain Garnier with La Harpe's commentary, 1807; Geoffroy's of the next year; Aimé Martin's of 1820; and lastly, the *grands écrivains* edition of Paul Mesnard (Paris, 1865-78). This last contains almost all that is necessary for the study of the poet, and has been chiefly used in preparing the above notice. Louis Racine's *Life* was first published in 1747. Translations and imitations of Racine are innumerable. In English the *Dis-tressed Mother* of Philips and the *Phædra and Hippolytus* of Smith, both composed more or less under Addison's influence, are the most noteworthy. (G. S.A.)

RACKETS. Like tennis, this game of ball is of French origin, and its name is derived from "raquette," the French term for the bat used in the pastime. In the United Kingdom it is not so universally pursued as cricket and football, and is essentially an indoor game, which is played only in prepared and covered courts. Such buildings have been erected at many of the large public schools, at the universities, and in garrison towns, where will be found the chief exponents of rackets, a game which requires active running powers, quick eyesight, and dexterity of hand.

The old "open" courts, which merely consisted of a plain wall without any side walls, are now almost obsolete and need not be further mentioned.

The usual dimensions of a "close" court are 80 feet by 40 feet for four-handed matches, whilst 60 feet by 30 feet are sufficient for a single match. Sometimes courts are built of an intermediate size so as to be available for either single or double matches. The front wall of a court should be 40 feet high, the back one 14 feet, the space over the latter being utilized by a gallery for spectators, umpire, and marker. The side walls are 40 feet high throughout, in order to support the roof. This must be well lit with skylights carried on light iron girders and protected inside with wire-work in order to ward off damage from the balls. Bricks make the best walls, which must be plastered inside with Roman cement or plaster of Paris, set to a perfectly level surface in order that the balls may rebound evenly. In the military officers' courts in India this plaster is painted white for the sake of

Racket court.

and protected inside with wire-work in order to ward off damage from the balls. Bricks make the best walls, which must be plastered inside with Roman cement or plaster of Paris, set to a perfectly level surface in order that the balls may rebound evenly. In the military officers' courts in India this plaster is painted white for the sake of

coolness, and black balls are in vogue. In England black paint and white balls are used. In cool climates asphalt makes the best flooring. In the tropics stone paving, perfectly evenly set, or some similar material, must be used. Gutta-percha soles to the shoes of the players are indispensable, to prevent slipping and to preserve the evenness of the flooring. The narrow entrance door, made of very hard wood, is situated in the centre of the back wall and must be perfectly flush with the same on the inside. The bottom of the front wall is covered with hollow deal sounding boarding up to a height of 2 feet 2 inches, where is the "line." The sound betrays a ball striking the boarding below the line, which throws it out of play. At 7 feet 9 inches above the level of the floor comes another white line across the front wall, termed the "cut line," because the in-player, when serving, must first make the ball rebound from the front wall above this line. Across the floor, varying in position according to the length of the court, is the "short line," so called because an out-player is not bound to take any ball served which falls between it and the front wall. The space between here and the back wall is divided into two equal-sized parallelograms by a line drawn down to the doorway. As the front wall is faced, these are called "right" and "left" courts. An in-player serving from one side must make the ball fall in the other court after rebounding from the front wall. The "service spaces," in which an in-player stands when serving, are 8 feet 6 inches deep from the short line and 6 feet 6 inches wide from each side wall.

The game is played with no other implements but bats and balls. The striking portion of the former is oval-shaped and strung tightly across with catgut. The handle is of pliant ash covered with leather in order to give the hand a tight grip. The balls are about $1\frac{1}{4}$ inches in diameter, and very hard in order to rebound evenly and quickly.

In a four-handed game we will suppose A and B to be playing against C and D and that the former couple have won the choice of first innings. A accordingly commences serving from the right service space into the left court, that being the most difficult one to return the ball from. B stands behind A to return any balls for his side in the back portion of the court. C stands where he likes ready to take the ball about to be served by A, whilst C's partner, D, places himself between A and B to take the fore court play for his side. For A's service to be good his ball must first strike the front wall above the cut line, and secondly rebound from the floor of the left-hand court, though whether it strike the side or back walls or not after rebounding from the front wall is immaterial. If these rules are complied with, C is bound to return the ball, at its first bound off the floor, on to the front wall above the sounding-board. If he does not succeed A and B score one ace in their favour. If C achieves his purpose the game is continued by one of either side returning the ball alternately, till a player either strikes the sounding-board, skies it into the roof or gallery, or strikes it later than the first bound off the floor. If A or B makes the first failure A is out. If it is C or D, the in-side scores an ace, and A continues serving alternately from each service space. The out-player may take a faulty service at his own option. If he does, the ace is played out in the usual way. When A is put out C goes in, then D, and lastly A's partner B, and so on in the same rotation. B is not allowed to follow A's first hand, as the latter has the advantage of possibly scoring the first ace. The player who gains the last ace of a game continues serving for the next. The mode of procedure in a single-handed match is precisely the same, each player going in alternately, but having no partner to aid him. It often happens that both sides go in and out several times running without scoring. The most difficult kind of services to take are the sharp "cut," which strikes the front wall just above the cut line and rebounds with great velocity, and the "nick" into the back corner of the court served into. Other strokes are the "drop," which places the ball only just above the wooden board, making it fall almost dead; the "volley," in which the ball is struck in the full before touching the floor; and lastly, the "cut," by which the ball acquires a twisting or rotatory spin as well as a forward motion caused by a descending diagonal stroke with the bat. The following are the rules of rackets as drawn up and used at Prince's Club, London, the leading racket club of the United Kingdom.

1. The game to be 15 up. At 13 all, the out-players may set it to 5, and at 14 all, to 3, provided this be done before another ball is struck.

2. The going in first, whether odds be given or not, to be decided by lot, but one hand only then is to be taken.

3. The ball to be served alternately from right and left, beginning whichever side the server pleases.

4. In serving, the server must have one foot in the space marked off for that purpose. The out-player to whom he serves may stand where he pleases, but his partner and the server's partner must both stand behind the server till the ball is served.

5. The ball must be served above, and not touching the line on the front wall, and it must strike the floor, before it bounds, within and not touching the lines enclosing the court on the side opposite to that in which the server stands.

6. A ball served below the line, or to the wrong side, is a fault, but it may be taken, and then the ace must be played out, and counts.

7. In serving, if the ball strikes anywhere before it reaches the front wall, it is a hand out.

8. In serving, if a ball touches the server or his partner before it has bounded twice it is a hand out, whether it was properly served or not.

9. It is a fault—

a. If the server is not in his proper place.

b. If the ball is not served over the line.

c. If it does not fall in the proper court.

d. If it touches the roof.

e. If it touches the gallery-netting, posts, or cushions.

The out-player may take a fault if he pleases, but if he fails in putting the ball up it counts against him.

10. Two consecutive faults put a hand out.

11. An out-player may not take a ball served to his partner.

12. The out-players may change their courts once only in each game.

13. If a player designedly stops a ball before the second bound it counts against him.

14. If a ball hits the striker's adversary above or on the knee, it is a let; if below the knee, or if it hits the striker's partner or himself, it counts against the striker.

15. Till a ball has been touched, or has bounded twice, the player or his partner may strike it as often as they please.

16. Every player should get out of the way as much as possible. If he cannot, the marker is to decide whether it is a let or not.

17. After the service, a ball going out of the court or hitting the roof is an ace; a ball hitting the gallery-netting, posts, or cushions, in returning from the front wall, is a let; but if it hits the roof before reaching the front wall it counts against the striker.

18. The marker's decision is final. If he has any doubt, he should ask advice; and, if he cannot decide positively, the ace is to be played over again. (H. F. W.)

RADAUTZ, a town in the Austrian duchy of Bukowina, is situated on the Suczava, about 15 miles from the frontier of Moldavia. It was formerly the seat of a Greek bishopric, removed to Czernowitz in 1786, and possesses a cathedral with the tombs of several Moldavian princes. It contains a Government stud, and manufactures paper, glass, machinery, beer, and brandy. In 1880 Radautz had 11,162 inhabitants.

RADBERTUS, head of the Benedictine abbey of Corbie, near Amiens, from 844 to 851, and one of the most prominent theological writers of his age, was born at or near Soissons towards the close of the 8th century, and became a monk of Corbie in 814, when he assumed the cloister name of PASCHASIUS. He soon gained recognition as a learned and successful teacher, and Adalhard, St Anskar the apostle of Sweden, Odo bishop of Beauvais, and Warinus abbot of Corvey in Saxony may be mentioned among the more distinguished of his pupils. In 844 he was chosen abbot, but as a disciplinarian he was more energetic than successful, and in 851 he resigned the office. In his official capacity he took part in the synod of Chiersy which condemned Gottschalk. Of the closing period of his life nothing is known, except that it was one of great literary activity.

His works include an *Expositio in Mattheum*, in twelve books a favourable specimen of the exegesis of that period, and the *Libri de Corpore et Sanguine Christi*, a pious and popularly written treatise, designed to prove that the elements in the sacrament are completely changed. The latter work, originally composed in 831, elicited a reply by Ratramnus, a brother monk of Corbie, who maintained that the body and blood of Christ were present in the Eucharist only "spiritualiter et secundum potentiam." The *De Puritate Virginis* of Radbertus (845) was also taken exception to by Ratramnus for its Docetic teaching as to the manner of Christ's birth "utero clauso."

RADCLIFFE, a town of Lancashire, is situated on the river Irwell, crossed by a bridge of two arches, and on the Lancashire and Yorkshire Railway, 7 miles north-west of Manchester and 2 south-west of Bury. The church of St Bartholomew dates from the time of Henry IV.; some of the Norman portions of the building still remain. The tower was rebuilt in 1665, the north transept added in 1846, and the whole building restored in 1870-73. It possesses some good windows and several ancient monu-

ments. Radcliffe Tower, dating from the 13th century, and formerly an extensive manorial residence, is now a complete ruin. Cotton-weaving, calico-printing, and bleaching are the principal industries, and there are extensive collieries in the neighbourhood. The town is governed by a local board of health established in 1866. The area of the urban sanitary district is 2453 acres, with a population in 1871 of 11,446, and in 1881 of 16,267.

Radcliffe is so called from a cliff of red rock on the south side of the Irwell opposite the town. The manor was held by Edward the Confessor, and was conferred on Roger de Poitou, but was forfeited by him soon after the Domesday survey. In the reign of Stephen it was granted to Ranulph de Gernons, earl of Chester.

RADCLIFFE, ANN WARD (1764-1823), novelist, was born in London on 9th July 1764. She was the author of three novels unsurpassed of their kind in English literature, *The Romance of the Forest* (1791), *The Mysteries of Udolpho* (1794), *The Italian* (1797). The interval of three years between the successive publications is noticeable; works so elaborate, intricate, and closely interwoven could not be written in a hurry. The second of the three novels is the one commonly associated with Mrs Radcliffe's name, but the preference is probably due to the title; each is an improvement on its predecessor, and the last is considerably the best on the whole in style as well as in plot and character. She wrote two other novels before any of these, the *Castles of Athlin and Dunbayne* (1789) and the *Sicilian Romance* (1790), but they attracted no special attention and deserve none, although in them she works with the same romantic materials—dreadful castles, wild adventures, terrible characters. One other was written after the famous three, but not published till 1826, three years after her death—*Gaston de Blondville*, interesting as an elaborate study of costume and scenery, and valuable as a monument of her accurate archæological learning, but comparatively tedious as a story, though not without passages in her best style. The circumstances that turned Mrs Radcliffe to literature are not recorded in the meagre memoir published under her husband's direction. Her maiden name was Ward, and her parents, who are described as "persons of great respectability, though engaged in trade," in London, had literary relations. Her husband was an Oxford graduate and proprietor and editor of the *English Chronicle*. After *The Italian* she gave up writing for publication, and was reported to have been driven mad by the horrors of her own creations. This was purely mythical. It appears that she never saw the Italian scenery which she depicts with such minuteness, and never left England but once, in the summer of 1794, after the completion of her *Udolpho*. A record of the tour was published in the following year, along with descriptions of a visit to the English Lakes, the beauties of which she was one of the first to celebrate. Of scenery, as might be judged from her novels, where the descriptions are often felt as a tedious impediment, Mrs Radcliffe was an enthusiastic amateur, and made driving tours with her husband every other summer through the English counties. She died in February 1823.

As a novelist Mrs Radcliffe deserves a much higher place than is accorded to her in general estimation. Critics familiar with her works, from Sir Walter Scott downwards, have shown themselves fully alive to the difference; but the general public confound her with puerile and extravagant imitators, who have vulgarized her favourite "properties" of rambling and ruinous old castles, dark, desperate, and cadaverous villains, secret passages, vaults, trapdoors, evidences of deeds of monstrous crime, sights and sounds of mysterious horror. She deserves at least the credit of originality, but apart from this there are three respects in which none of her numerous imitators approach her,—ingenuity of plot, fertility of incident, and skill in devising apparently supernatural occurrences capable of explanation by human agency and natural coincidence. Except in her last and posthumously published work she never introduces the really supernatural, and, whether or not we agree with Sir Walter Scott that this limitation was a mistake in art, it must at least be acknowledged to impose a heavier burden on the author's

ingenuity. Her imitators found it easier to follow Horace Walpole in this point. Some of the tragic situations in *The Italian* are worked out with a vivid power of imagination which it would be hard to parallel in English literature outside the range of the Elizabethan drama, with the minor celebrities of which Mrs Radcliffe may fairly challenge comparison.

RADETZKY, JOHANN J. W. A. F. C., COUNT OF RADETZ (1766-1858), field-marshal of Austria, was born at Trzebnitz in Bohemia in 1766, to the nobility of which province his family belonged. He entered a cavalry regiment in 1784 and served under Joseph II. and Laudon against the Turks in 1788 and 1789. In 1793 his regiment was sent to the lower Rhine, and from this time onwards Radetzky was engaged in the wars which were continued (with intermission) between Austria and France for the next twenty years. In 1796 he was adjutant to General Beaulieu, over whom Bonaparte won his first victories in Italy. In 1799, when the Austrians with Suwaroff's help reconquered Northern Italy, he distinguished himself at the battles of Novi and the Trebbia, displaying, according to the despatches of General Mélas, great presence of mind in the midst of extreme danger. After the defeat of Marengo he was removed from Italy to Germany, and there took part in the still more disastrous engagement of Hohenlinden. In 1805 Radetzky, now major-general, was back in Italy, serving under the archduke Charles in the successful campaign of Caldiero, the fruits of which were lost by Mack's capitulation at Ulm and the fall of Vienna. In 1809 he fought at Wagram. In 1813, when all the great powers of Europe combined against Napoleon, Radetzky was chief of the staff under Schwarzenberg, the Austrian commander-in-chief of the allied forces, and he now gained a reputation outside his own country. The plan of the battle of Leipsic is said to have been in great part Radetzky's work, and in this engagement he was wounded. He entered Paris with the allied sovereigns in March 1814, and returned with them to the congress of Vienna, where he appears to have acted as an intermediary between Metternich and the czar Alexander, when these great personages were not on speaking terms. During the succeeding years of peace he disappeared from the public view and narrowly escaped being pensioned off in 1829. The insurrection of the Papal Legations in 1831 brought him, however, into active service again; and on the retirement of General Frimont he was placed in command of all the Austrian forces in Italy, receiving in 1836 the dignity of field-marshal. Radetzky was now seventy years old, but twelve more years were to pass before the really historical part of his career opened. When he was eighty-two the revolution of 1848 broke out. Milan rose in insurrection against its Austrian rulers, and after a struggle of five days Radetzky was forced to evacuate the city. Unable to retain any hold on Lombardy, he concentrated his troops at Verona, the fortifications of which were to a great extent his own creation. Charles Albert, king of Sardinia, now declared war upon Austria, occupied Milan, and laid siege to Peschiera. Radetzky, after the arrival of reinforcements, moved southwards to Mantua, and attempted from that point to turn the Sardinian flank; he was, however, defeated on the Mincio, and Peschiera fell into the enemy's hands. Radetzky, nevertheless, was secure in the possession of Verona and Mantua; and, after being still further reinforced, he resumed the offensive in July, defeated the Sardinians at Custoza and in several other encounters, and advanced victoriously upon Milan, where, on 6th August, an armistice was concluded, the Sardinian army retiring behind the Ticino. During the succeeding months, while Vienna and the central provinces of the Austrian empire appeared likely to fall into anarchy, Radetzky's army remained firm in its loyalty to the old order of things, and declined to enter

into relations with the democratic leaders. It was in fact at this time the mainstay of the house of Hapsburg, while everything around the central government tottered; and, when the restoration of authority began, and the young emperor Francis Joseph ascended the throne that had been vacated by his imbecile predecessor, Radetzky gave to the new monarch the prestige of a crushing victory over his Italian enemies. The armistice was denounced by Charles Albert on the 12th of March 1849. On the 20th Radetzky crossed the Ticino at Pavia, and on the 23d he annihilated the Italian army at Novara. Peace followed this brief and decisive campaign, and for the next eight years Radetzky governed upper Italy. He retired from service in 1857, and died at the age of ninety-two in the following year. Radetzky was idolized by the Austrian army, but his reputation as a general has not survived him.

RADHANPUR, a petty state of India, within the group of states under the supervision of the political superintendent of Palanpur; it is situated in the north-western corner of Gujarat, close to the Runn of Cutch, Bombay presidency, and lies between 23° 26' and 23° 58' N. lat. and between 71° 28' and 72° 3' E. long. The country is an open plain without hills and with few trees, square in shape, and about 35 miles across. Including the pergunnahs of Munjpur and Sami, it contains an area of 1150 square miles with a population (1881) of 98,129 (males 50,903, females 47,226), the majority being Hindus. Though subject to very great extremes of heat and cold, the climate is healthy. The estimated yearly revenue of the state is from £50,000 to £60,000. Its chief products are cotton, wheat, and all the common varieties of grain; the only manufacture of any importance is the preparation of a fine description of salt-petre. Radhanpur came under British protection in 1819, when the nawab applied for aid to check the raids of marauders. No tribute is exacted and its domestic relations are left entirely free.

RADHANPUR, chief town of the state and the seat of the nawab, had a population of 14,722 in 1881. The nearest railway station is at Kharagoda, 40 miles distant.

RADIATA. This term was introduced by Cuvier in 1812 to denote the lowest of his four great animal groups or "embranchements." He defined them as possessing radial instead of bilateral symmetry, and as apparently destitute of nervous system and sense organs, as having the circulatory system rudimentary or absent, and the respiratory organs on or coextensive with the surface of the body; he included under this title and definition five classes,—Echinodermata, Acalepha, Entozoa, Polypi, and Infusoria. Lamarck (*Hist. nat. d. Anim. s. Vertèbres*) also used the term, as when he spoke of the Medusæ as *radiata medusaria et anomala*; but he preferred the term Radiaria, under which he included Echinodermata and Medusæ. Cuvier's term in its wide extension, however, passed into general use; but, as the anatomy of the different forms became more fully known, the difficulty of including them under the common designation made itself increasingly obvious. Milne-Edwards removed the Polyzoa; the group was soon further thinned by the exclusion of the Protozoa on the one hand and the Entozoa on the other; while in 1848 Leuckart and Frey clearly distinguished the Coelenterata from the Echinodermata as a separate sub-kingdom, thus condemning the usage by which the term still continued to be applied to these two groups at least. In 1855, however, Owen included under Lamarck's term Radiaria the Echinodermata, Anthozoa, Acalepha, and Hydrozoa, while Agassiz also clung to the term Radiata as including Echinodermata, Acalepha, and Polypi, regarding their separation into Coelenterata and Echinodermata as "an exaggeration of their anatomical differences" (*Essay on Classification*, London, 1859).

These attempts, however, to perpetuate the usage were finally discredited by Huxley's important *Lectures on Comparative Anatomy* (1864), in which the term was finally abolished, and the "radiate mob" finally distributed among the Echinodermata, Polyzoa, Vermes (Platyhelminthes), Coelenterata, and Protozoa. On radiate symmetry, see MORPHOLOGY. Compare also CUVIER, ANIMAL KINGDOM, ECHINODERMATA, CORALS, &c.

RADIATION AND CONVECTION. 1. When a red-hot cannon ball is taken out of a furnace and suspended in the air it is observed to cool, i.e., to part with heat, and it continues to do so at a gradually diminishing rate till it finally reaches the temperature of the room. But the process by which this effect is produced is a very complex one. If the hand be held at a distance of a few inches from the hot ball on either side of it or *below* it, the feeling of warmth experienced is considerable; but it becomes intolerable when the hand is held at the same distance *above* the ball. Even this rude form of experiment is sufficient to show that two processes of cooling are simultaneously at work,—one which apparently leads to the loss of heat in all directions indifferently, another which leads to a special loss in a vertical direction upwards. If the experiment is made in a dark room, into which a ray of sunlight is admitted so as to throw a shadow of the ball on a screen, we see that the column of air above the ball also casts a distinct shadow. It is, in fact, a column of air very irregularly heated by contact with the ball, and rising, in obedience to hydrostatic laws, in the colder and denser air around it. This conveyance of heat by the motion of the heated body itself is called *convection*; the process by which heat is lost indifferently in all directions is called *radiation*. These two processes are entirely different in their nature, laws, and mechanism; but we have to treat of both in the present article.

2. To illustrate how the third method by which heat can be transferred, viz., *conduction* (see HEAT, vol. xi. p. 577), is involved in this process, let the cannon ball (which for this purpose should be a large one) be again heated and at once immersed in water until it just ceases to be luminous in the dark, and then be immediately hung up in the air. After a short period it again becomes red-hot all over, and the phenomenon then proceeds precisely as before, except that the surface of the ball does not become so hot as it was before being plunged in the water. This form of experiment, which requires that the interior shall be very considerably cooled before the surface ceases to be self-luminous, does not succeed nearly so well with a copper ball as with an iron one, on account of the comparatively high conductivity of copper. In fact, even when its surface is covered with lamp-black, to make the loss by radiation as great as possible, the difference of temperature between the centre and the surface of a very hot copper ball—which is only an inch or two in diameter—is inconsiderable.

3. In conduction there is passage of heat from hotter to colder parts of the same body; in convection an irregularly heated fluid becomes hydrostatically unstable, and each part carries its heat with it to its new position. In both processes heat is conveyed from place to place. But it is quite otherwise with radiation. That a body cools in consequence of radiation is certain; that other bodies which absorb the radiation are thereby heated is also certain; but it does not at all follow that what passes in the radiant form is heat. To return for a moment to the red-hot cannon ball. If, while the hand is held below it, a thick but dry plate of rock-salt is interposed between the ball and the hand there is no perceptible diminution of warmth, and the temperature of the salt is not perceptibly raised by the radiation which passes through it. When a piece-

of clear ice is cut into the form of a large burning-glass it can be employed to inflame tinder by concentrating the sun's rays, and the lens does the work nearly as rapidly as if it had been made of glass. It is certainly not what we ordinarily call "heat" which can be transmitted under conditions like these. Radiation is undoubtedly a transference of energy, which was in the form commonly called heat in the radiating body, and becomes heat in a body which absorbs it; but it is transformed as it leaves the first body, and retransformed when it is absorbed by the second. Until the comparatively recent full recognition of the conservation and transformation of energy it was almost impossible to form precise ideas on matters like this; and, consequently, we find in the writings even of men like Prévost and Sir J. Leslie notions of the wildest character as to the mechanism of radiation. Leslie, strangely, regarded it as a species of "pulsation" in the air, in some respects analogous to sound, and propagated with the same speed as sound. Prévost, on the other hand, says, "*Le calorique est un fluide discret; chaque élément de calorique suit constamment la même ligne droite, tant qu'aucun obstacle ne l'arrête. Dans un espace chaud, chaque point est traversé sans cesse en tout sens par des filets de calorique.*"

4. The more intensely the cannon ball is heated the more luminous does it become, and also the more nearly white is the light which it gives out. So well is this known that in almost all forms of civilized speech there are terms corresponding to our "red-hot," "white-hot," &c. As another instance, suppose a powerful electric current is made to pass through a stout iron wire. The wire becomes gradually hotter, up to a certain point, at which the loss by radiation and convection just balances the gain of heat by electric resistance. And as it becomes hotter the amount of its radiation increases, till at a definite temperature it becomes just visible in the dark by red rays of low refrangibility. As it becomes still hotter the whole radiation increases; the red rays formerly given off become more luminous, and are joined by others of higher refrangibility. This process goes on, the whole amount of radiation still increasing, each kind of visible light becoming more intense, and new rays of light of higher refrangibility coming in, until the whole becomes white, *i.e.*, gives off all the more efficient kinds of visible light in much the same relative proportion as that in which they exist in sunlight. When the circuit is broken, exactly the same phenomena occur in the reverse order, the various kinds of light disappearing later as their refrangibility is less. But the radiation continues, growing weaker every instant, even after the whole is dark. This simple observation irresistibly points to the conclusion that the so-called "radiant heat" is precisely the same phenomenon as "light," only the invisible rays are still less refrangible than the lowest red, and that our sense of sight is confined to rays of a certain definite range of refrangibility, while the sense of touch comes in where sight fails us. Sir W. Herschel in 1798, by placing the bulb of a thermometer in the solar spectrum formed by a flint-glass prism, found that the highest temperature was in the dark region outside the lowest visible red,—a result amply verified at the time by others, though warmly contested by Leslie.

5. This striking conclusion is not without close analogies in connexion with the other senses, especially that of hearing. Thus it has long been known that the "range of hearing" differs considerably in different individuals, some, for instance, being painfully affected by the chirp of a cricket, which is inaudible to others whose general hearing is quite as good. Extremely low notes, on the other hand, of whose existence we have ample dynamical

evidence, are not heard by any one; when perceived at all they are *felt*.

6. We may now rapidly run over the principal facts characteristic of the behaviour of visible rays (see LIGHT), and point out how far each has been found to characterize that of so-called "radiant heat" under similar conditions.

(a) Rectilinear propagation: an opaque screen which is placed so as to intercept the sun's light intercepts its heat also, whether it be close to the observer, at a few miles from him (as a cloud or a mountain), or 240,000 miles off (as the moon in a total eclipse). (b) Speed of propagation: this must be of the same order of magnitude, at least, for both phenomena, *i.e.*, 186,000 miles or so per second; for the sun's heat ceases to be perceptible the moment an eclipse becomes total, and is perceived again the instant the edge of the sun's disk is visible. (c) Reflexion: the law must be exactly the same, for the heat-producing rays from a star are concentrated by Lord Rosse's great reflector along with its light. (d) Refraction: when a lens is not achromatic its principal focus for red rays is farther off than that for blue rays; that for dark heat is still farther off. Herschel's determination of the warmest region of the spectrum (§ 4 above) is another case in point. (e) Oblique radiation: an illuminated or a self-luminous surface appears equally bright however it is inclined to the line of sight. The radiation of heat from a hot blackened surface (through an aperture which it appears to fill) is sensibly the same however it be inclined (Leslie, Fourier, Melloni). (f) Intensity: when there is no absorption by the way the intensity of the light received from a luminous point-source is inversely as the square of the distance. The same is true of dark heat. But this is not a new analogy; it is a mere consequence of (a) rectilinear propagation. (g) Selective absorption: light which has been sifted by passing through one plate of blue glass passes in much greater percentage through a second plate of the same glass, and in still greater percentage through a third. The same is true of radiant heat, even when the experiment is made with uncoloured glass; for clear glass absorbs certain colours of dark heat more than others (De Larocche, Melloni). (h) Interference bands, whether produced by two mirrors or by gratings, characterize dark heat as well as light; only they indicate longer waves (Fizeau and Foucault). (i) Polarization and double refraction: with special apparatus, such as plates of mica split by heat into numerous parallel films, the polarization of dark heat is easily established. When two of these bundles are so placed as to intercept the heat, an unsplit film of mica interposed between them allows the heat to pass, or arrests it, as it is made to rotate in its own plane (Forbes). (j) By proper chemical adjustments photographs of a region of the solar spectrum beyond the visible red have been obtained (Abney). We might mention more, but those given above, when considered together, are conclusive. In fact (b) or (i) alone would almost settle the question.

7. But there is a superior as well as an inferior limit of visible rays. Light whose period of vibration is too small to produce any impression on the optic nerve can be degraded by fluorescence (see LIGHT) into visible rays, and can also be detected by its energetic action on various photographic chemicals. In fact photographic portraits can be taken in a room which appears absolutely dark to the keenest eyesight. By one or other of these processes the solar spectrum with its dark lines and the electric arc with its bright lines have been delineated to many times the length of their visible ranges. The electric arc especially gives (in either of these ways) a spectrum of extraordinary length; for we can examine it, as we can *not* examine sunlight, before it has suffered any sensible absorption.

8. Thus radiation is one phenomenon, and (as we shall find) the spectrum of a *black body* (a conception roughly realized in the carbon poles of an electric lamp) is continuous from the longest possible wave-length to the shortest which it is hot enough to emit. These various groups of rays, however, are perceived by us in very different ways, whether by direct impressions of sense or by the different modes in which they effect physical changes or transformations. The only way as yet known to us of treating them all alike is to convert their energy into the heat-form and measure it as such. This we can do in a satisfactory manner by the thermo-electric pile and galvanometer.

9. Of the history of the gradual development of the theory of radiation we can give only the main features. The apparent concentration of cold by a concave mirror, which had been long before observed by Porta, was rediscovered by Pictet, and led to the extremely important enunciation of the Law of Exchanges by Prévost in 1791. As we have already seen, Prévost's idea of the nature of radiation was a corpuscular one, no doubt greatly influenced in this direction by the speculations of Lesage (see *ATOM*). But the value of his theory as a concise statement of facts and a mode of co-ordinating them is not thereby materially lessened. We give his own statements in the following close paraphrase, in which the italics are retained, from sect. ix. of his *Du Calorique Rayonnant* (Geneva, 1809).

"1. Free caloric is a radiant fluid. And because caloric becomes free at the surfaces of bodies *every point of the surface of a body is a centre, towards and from which filaments (filets) of caloric move in all directions.*

"2. *Heat equilibrium between two neighbouring free spaces consists in equality of exchange.*

"3. *When equilibrium is interfered with it is re-established by inequalities of exchange. And, in a medium of constant temperature, a hotter or a colder body reaches this temperature according to the law that difference of temperature diminishes in geometrical progression in successive equal intervals of time.*

"4. *If into a locality at uniform temperature a reflecting or refracting surface is introduced, it has no effect in the way of changing the temperature at any point in that locality.*

"5. *If into a locality otherwise at uniform temperature there is introduced a warmer or a colder body, and next a reflecting or refracting surface, the points on which the rays emanating from the body are thrown by these surfaces will be affected, in the sense of being warmed if the body is warmer, and cooled if it is colder.*

"6. *A reflecting body, heated or cooled in its interior, will acquire the surrounding temperature more slowly than would a non-reflector.*

"7. *A reflecting body, heated or cooled in its interior, will less affect (in the way of heating or cooling it) another body placed at a little distance than would a non-reflecting body under the same circumstances.*

"All these consequences have been verified by experiment, except that which regards the *refraction of cold*. This experiment remains to be made, and I confidently predict the result, at least if the refraction of cold can be accurately observed. This result is indicated in the fourth and fifth consequences [above], and they might thus be subjected to a new test. It is scarcely necessary to point out here the precautions requisite to guard against illusory results of all kinds in this matter."

10. There the matter rested, so far as theory is concerned, for more than half a century. Leslie and, after him, many others added fact by fact, up to the time of De la Provostaye and Desains, whose experiments pointed to a real improvement of the theory in the form of specialization. But, though such experiments indicated, on the whole, a proportionality between the radiating and absorbing powers of bodies and a diminution of both in the case of highly reflecting surfaces, the anomalies frequently met with (depending on the then unrecognized colour-differences of various radiations) prevented any grand generalization. The first real step of the general theory, in advance of what Prévost had achieved, and it was one of immense import, was made by Balfour Stewart in 1858. Before we take it up, however, we may briefly consider Prévost's statements, putting aside his erroneous views as to the nature

of heat; and we must also introduce some results of the splendid investigations of Sadi Carnot (1824), which cast an entirely new light on the whole subject of heat.

11. Prévost's leading idea was that all bodies, whether cold or hot, are constantly radiating heat. This of itself was a very great step. It is distinctly enunciated in the term "exchange" which he employs. And from the way in which he introduces it it is obvious that he means (though he does not expressly say so) that the radiation from a body depends on its own nature and temperature alone, and is independent altogether of the nature and temperature of any adjacent body. This also was a step in advance, and of the utmost value. It will be seen later that Prévost was altogether wrong in his assumption of the geometrical rate of adjustment of differences of temperature,—a statement originally made by Newton, but true only approximately, and even so for very small temperature differences alone. Newton in the *Queries* to the third book of his *Optics* distinctly recognizes the propagation of heat from a hot body to a cold one by the vibrations of an intervening medium. But he says nothing as to bodies of the same temperature.

12. To Carnot we owe the proposition that *the thermal motivity of a system cannot be increased by internal actions*. A system in which all the parts are at the same temperature has no thermal motivity, for bodies at different temperatures are required in order to work a heat-engine, so as to convert part of their heat into work. Hence, if the contents of an enclosure which is impervious to heat are at any instant at one and the same temperature, no changes of temperature can take place among them. This is certainly true so far as our modes of measurement are concerned, because the particles of matter (those of a gas, for instance) are excessively small in comparison with the dimensions of any of our forms of apparatus for measuring temperatures. Something akin to this statement has often been assumed as a direct result of experiment: *a number of bodies (of any kinds) within the same impervious enclosure, which contains no source of heat, will ultimately acquire the same temperature*. This form is more general than that above, inasmuch as it involves considerations of dissipation of energy. Either of them, were it strictly true, would suffice for our present purpose. But neither statement can be considered as rigorously true. We may employ them, however, in our reasoning as true in the statistical sense; but we must not be surprised if we should find that the assumption of their rigorous truth may in some special cases lead us to theoretical results which are inconsistent with experimental facts,—*i.e.*, if we should find that deviations from an average, which are on far too minute a scale to be directly detected by any of our most delicate instruments, may be seized upon and converted into observable phenomena by some of the almost incomparably more delicate systems which we call individual particles of matter.

13. The next great advance was made by Balfour Stewart.¹ The grand novelty which he introduced, and from which all his varied results follow almost intuitively, is the idea of *the absolute uniformity (qualitative as well as quantitative) of the radiation at all points, and in all directions, within an enclosure impervious to heat, when thermal equilibrium has once been arrived at*. (So strongly does he insist on this point that he even states that, whatever be the nature of the bodies in the enclosure, the radiation there will, when equilibrium is established, be that of a black body at the same temperature. He does not expressly say that the proposition will still be true even if the bodies can radiate, and therefore absorb, one definite wave-length only; but this is a legitimate deduction from his state-

¹ *Trans. R. S. E.*, 1858; see also *Phil. Mag.*, 1863, i. p. 354.

ments. To this we will recur.) His desire to escape the difficulties of surface-reflexion led him to consider the radiation inside an imperfectly transparent body in the enclosure above spoken of. He thus arrived at an immediate proof of the existence of internal radiation, which recruits the stream of radiant heat in any direction step by step precisely to the amount by which it has been weakened by absorption. Thus the radiation and absorption rigorously compensate one another, not merely in quantity but in quality also, so that a body which is specially absorptive of one particular ray is in the same proportion specially radiative of the same ray, its temperature being the same in both cases. To complete the statement, all that is necessary is to show how one ray may differ from another, viz., in intensity, wave-length, and polarization.

14. The illustrations which Stewart brought forward in support of his theory are of the two following kinds. (1) He experimentally verified the existence of internal radiation, to which his theory had led him. This he did by showing that a thick plate of rock-salt (chosen on account of its comparative transparency to heat-radiations) radiates more than a thin one at the same temperature,—surrounding bodies being in this case of course at a lower temperature, so that the effect should not be masked by transmission. The same was found true of mica and of glass. (2) He showed that each of these bodies is more opaque to radiations from a portion of its own substance than to radiation in general. Then comes his conclusion, based, it will be observed, on his fundamental assumption as to the nature of the equilibrium radiation in an enclosure. It is merely a detailed explanation that, once equilibrium has been arrived at, the consequent uniformity of radiation throughout the interior of a body requires the step-by-step compensation already mentioned. And thus he finally arrives at the statement that at any temperature a body's radiation is exactly the same both as to quality and quantity as that of its absorption from the radiation of a black body at the same temperature. In symbolical language Stewart's proposition (extended in virtue of a principle always assumed) amounts to this:—at any one temperature let R be the radiation of a black body, and eR (where e is never greater than 1) that of any other substance, both for the same definite wave-length; then the substance will, while at that temperature, absorb the fraction e of radiation of that wave-length, whatever be the source from which it comes. The last clause contains the plausible assumption already referred to. Stewart proceeds to show, in a very original and ingenious way, that his result is compatible with the known facts of reflexion, refraction, &c., and arrives at the conclusion that for internal radiation parallel to a plane the amount is (in isotropic bodies) proportional to the refractive index. Of course, when the restriction of parallelism to a plane is removed the internal radiation is found to be proportional to the square of the refractive index. This obvious completion of the statement was first given by Stewart himself at a somewhat later date.

15. So far Stewart had restricted his work to "dark heat," as it was then called; and he says that he did so expressly in order to confine himself to rays "which were universally acknowledged to produce heat by their absorption." But he soon proceeded to apply himself to luminous radiations. And here he brought forward the extremely important fact that "coloured glasses invariably lose their colour in the fire" when exactly at the temperature of the coals behind them, i.e., they compensate exactly for their absorption by their radiation. But a red glass when colder than the coals behind appears red, while if it be hotter than they are it appears green. He also showed that a piece of china or earthenware with a dark pattern on a light ground appears to have a light pattern on a

dark ground when it is taken out of the fire and examined in a dark room. Hence he concluded that his extension of Prévost's theory was true for luminous rays also.

16. In this part of the subject he had been anticipated, for Fraunhofer had long ago shown that the flame of a candle when examined by a prism gives bright lines (i.e., maxima of intensity of radiation) in the position of the constituents of a remarkable double dark line (i.e., minima of radiation) in the solar spectrum, which he called D . Hallows Miller had afterwards more rigorously verified the exact coincidence of these bright and dark lines. But Foucault¹ went very much farther, and proved that the electric arc, which shows these lines bright in its spectrum, not only intensifies their blackness in the spectrum of sunlight transmitted through it, but produces them as dark lines in the otherwise continuous spectrum of the light from one of the carbon points, when that light is made by reflexion to pass through the arc. Stokes about 1850 pointed out the true nature of the connexion of these phenomena, and illustrated it by a dynamical analogy drawn from sound. He stated his conclusions to Sir W. Thomson,² who (from 1852 at least) gave them regularly in his public lectures, always pointing out that one constituent of the solar atmosphere is certainly sodium, and that others are to be discovered by the coincidences of solar dark lines with bright lines given by terrestrial substances rendered incandescent in the state of vapour. Stokes's analogy is based on the fact of synchronism (long ago discussed by Hooke and others), viz., that a musical string is set in vibration when the note to which it is tuned is sounded in its neighbourhood. Hence we have only to imagine a space containing a great number of such strings, all tuned to the same note. Such an arrangement would form, as it were, a medium which, when agitated, would give that note, but which would be set in vibration by, and therefore diminish the intensity of, that particular note in any mixed sound which passed through it.

17. Late in 1859 appeared Kirchhoff's first paper on the subject.³ He supplied one important omission in Stewart's development of the theory by showing *why* it is necessary to use as an absorbing body one colder than the source in order to produce reversal of spectral lines. This we will presently consider. Kirchhoff's proof of the equality of radiating and absorbing powers is an elaborate but unnecessary piece of mathematics, called for in consequence of his mode of attacking the question. He chose to limit his reasoning to special wave-lengths by introducing the complex mechanism of the colours of thin plates (LIGHT, vol. xiv. p. 608), and a consequent appeal to Fourier's theorem (HARMONIC ANALYSIS, vol. xi. p. 481), instead of to the obviously permissible assumption of a substance imperfectly transparent for one special wave-length, but perfectly transparent for all others; and he did not, as Stewart had done, carry his reasoning into the interior of the body. With all its elaboration, his mode of attacking the question leads us no farther than could Stewart's. Both are ultimately based on the final equilibrium of temperature in an enclosure required by Carnot's principle, and both are, as a consequence, equally inapplicable to exceptional cases, such as the behaviour of fluorescent or phosphorescent substances. In fact (see THERMODYNAMICS) Carnot's principle is established only on a statistical basis of averages, and is not necessarily true when we are dealing with portions of space, which, though of essentially finite dimensions, are extremely small in comparison with the sentient part of even the tiniest instrument for measuring temperature.

18. Kirchhoff's addition to Stewart's result may be given as follows. Let radiation r , of the same particular wave-length as that spoken of in § 14, fall on the substance; er of it will be absorbed, and $(1-e)r$ transmitted. This will be recruited by the radiation of the substance itself, so that the whole amount for that particular wave-length becomes $(1-e)r + eR$, or $r - e(r - R)$. Thus the radiation is weakened only when $R < r$, a condition which requires that the source (even if it be a black body) should be at a higher temperature than the absorbing substance (§ 4, above). But the converse is, of course, not necessarily true. This part of the subject, as well as the special work of Kirchhoff and of Bunsen, belongs properly to spectrum analysis (see SPECTROSCOPY).

19. From the extension of Prévost's theory, obtained in either of the ways just explained, we see at once how the constancy of the radiation in an enclosure is maintained. In the neighbourhood of and perpendicular to the surfaces of a black body it is wholly due to radiation, near a transparent body wholly to transmission. A body which reflects must to the same extent be deficient in its radiation and transmission; thus a perfect reflector can neither radiate nor transmit. And a body which polarizes by reflexion must supply by radiation what is requisite to render the whole radiation unpolarized. A body, such as a plate of tourmaline, which polarizes transmitted light, must radiate light polarized in the same plane as that which it absorbs. Kirchhoff and Stewart independently gave this beautiful application.

20. Empirical formulæ representing more or less closely the law of cooling of bodies, whether by radiation alone or by simultaneous radiation and convection, have at least an historic interest. What is called Newton's Law of Cooling was employed by Fourier in his *Théorie Analytique de la Chaleur*. Here the rate of surface-loss was taken as proportional to the excess of temperature over surrounding bodies. For small differences of temperature it is accurate enough in its applications, such as to the corrections for loss of heat in experimental determinations of specific heat, &c., but it was soon found to give results much below the truth, even when the excess of temperature was only 10°C .

21. Dulong and Petit, by carefully noting the rate of cooling of the bulb of a large thermometer enclosed in a metallic vessel with blackened walls, from which the air had been as far as possible extracted and which was maintained at a constant temperature, were led to propound the exponential formula $Aa^t + B$ to represent the radiation from a black surface at temperature t . As this is an exponential formula, we may take t as representing absolute temperature, for the only result will be a definite change of value of the constant A . Hence if t_0 be the temperature of the enclosure, the rate of loss of heat should be $A(a^t - a^{t_0})$, or $Aa^{t_0}(a^{t-t_0} - 1)$. The quantity A was found by them to depend on the nature of the radiating surface, but a was found to have the constant value 1.0077. As the approximate accuracy of this expression was verified by the experiments of De la Provostaye and Desains for temperature differences up to 200°C ., it may be well to point out two of its consequences. (1) For a given difference of temperatures the radiation is an exponential function of the lower (or of the higher) temperature. (2) For a given temperature of the enclosure the radiation is as $(1.0077)^{\theta} - 1$, or $\theta(1 + 0.0038\theta + \dots)$, where θ is the temperature excess of the cooling body. Thus the Newtonian law gives 4 per cent. too little at 10°C . of difference.

22. Dulong and Petit have also given an empirical formula for the rate of loss by simultaneous radiation and convection. This is of a highly artificial character, the part due to radiation being as in the last section, while that due to convection is independent of it, and also of the

nature of the surface of the cooling body. It is found to be proportional to a power of the pressure of the surrounding gas (the power depending on the nature of the gas), and also to a definite power of the temperature excess. The reader must be referred to French treatises, especially that of Desains, for further information.

23. Our knowledge of the numerical rate of surface-emission is as yet scanty, but the following data, due to Nicol,¹ may be useful in approximate calculations. Loss in heat units (1 lb water raised 1°C . in temperature) per square foot per minute, from

Bright copper	1.09	0.51	0.42
Blackened copper	2.03	1.46	1.35.

The temperatures of body and enclosure were 58°C . and 8°C ., and the pressure of contained air in the three columns was about 30, 4, and 0.4 inches of mercury respectively. The enclosure was blackened.

24. Scanty as is our knowledge of radiation, it is not at all surprising that that of convection should be almost *nil*, except as regards some of its practical applications. Here we have to deal with a problem of hydrokinetics of a character, even in common cases, of far higher difficulty than many hydrokinetic problems of which not even approximate solutions have been obtained.

25. What is called Döpler's Principle (LIGHT, vol. xiv. p. 614) has more recently² led Stewart to some curious speculations, which a simple example will easily explain. Suppose two parallel plates of the same substance, perfectly transparent except to one definite wave-length, to be moving towards or from one another. Each, we presume, will radiate as before, and on that account cool; but the radiation which reaches either is no longer of the kind which alone it can absorb, whether it come directly from the other, or is part of its own or of the other's radiation reflected from the enclosure. Hence it would appear that relative motion is incompatible with temperature equilibrium in an enclosure, and thus that there must be some effect analogous to resistance to the motion. We may get over this difficulty if we adopt the former speculation of Stewart, referred to in brackets in § 13 above. For this would lead to the result that, as soon as either of the bodies has cooled, ever so slightly, the radiation in the enclosure should become that belonging to a black body of a slightly higher temperature than before, and thus the plates would be furnished with radiation which they could at once absorb, and be gradually heated to their former temperature.

26. A very recent speculation, founded by Boltzmann³ upon some ideas due to Bartoli, is closely connected in principle with that just mentioned. This speculation is highly interesting, because it leads to an expression for the amount of the whole radiation from a black body in terms of its absolute temperature. Boltzmann's investigation may be put, as follows, in an exceedingly simple form. It was pointed out by Clerk Maxwell, as a result of his electro-magnetic theory of light, that radiation falling on the surface of a body must produce a certain pressure. It is easy to see (most simply by the analogy of the virial equation, MECHANICS, vol. xv. p. 719) that the measure of the pressure per square unit on the surface of an impervious enclosure, in which there is thermal equilibrium, must be one-third of the whole energy of radiation per cubic unit of the enclosed space. We may now consider a reversible engine conveying heat from one black body to another at a different temperature, by operations alternately of the isothermal and the adiabatic character (THERMODYNAMICS), which consist in altering the volume of the en-

¹ *Proc. R. S. E.*, vii. 1870, p. 208.

² *Brit. Assoc. Report*, 1871.

³ *Wiedemann's Ann.*, 1884, xxii.

closure, with or without one of the bodies present in it. For one of the fundamental equations gives

$$\frac{dE}{dv} = t \frac{dp}{dt} - p,$$

where t is the absolute temperature. If f be the pressure on unit surface, $3f$ is the energy per unit of volume, and this equation becomes

$$t \frac{df}{dt} - f = 3f.$$

Hence it follows at once that, if the fundamental assumptions be granted, the energy of radiation of a black body per unit volume of the enclosure is proportional to the fourth power of the absolute temperature. It is not a little remarkable that Stefan¹ had some years previously shown that this very expression agrees more closely with the experimental determinations of Dulong and Petit than does their own empirical formula.

27. It would appear from this expression that, if an impervious enclosure containing only one black body in thermal equilibrium is separated into two parts by an impervious partition, any alteration of volume of the part not containing the black body will produce a corresponding alteration of the radiation in its interior. It will now correspond to that of a second black body, whose temperature is to that of the first in the inverse ratio of the fourth roots of the volumes of the detached part of the enclosure.

28. Lecher² has endeavoured to show that the distribution of energy among the constituents of the radiation from a black body does not alter with temperature. Such a result, though apparently inconsistent with many well-known facts, appears to be consistent with and to harmonize many others. It accords perfectly with the notion of the absolute uniformity (statistical) of the energy in an enclosure, and its being exactly that of a black body, even if the contents (as in § 25) consist of a body which can radiate one particular quality of light alone. And if this be the case it will also follow that the intensity of radiation of any one wave-length by any one body in a given state depends on the temperature in exactly the same way as does the whole radiation from a black body. Unfortunately this last deduction does not accord with Melloni's results; at least the discrepancy from them would appear to be somewhat beyond what could fairly be set down to error of experiment. But it is in thorough accordance with the common assumption (§ 14) that the percentage absorption of any particular radiation does not depend on the temperature of the source. The facts of fluorescence and phosphorescence, involving the radiation of visible rays at temperatures where even a black body is invisible, have not yet been dealt with under any general theory of radiation; though Stokes has pointed out a dynamical explanation of a thoroughly satisfactory character, they remain outside the domain of Carnot's principle. (P. G. T.)

RADIOMETER. See PNEUMATICS, vol. xix. p. 249.

RADISH. See HORTICULTURE, vol. xii. pp. 286, 287.

RADNOR, an inland county of South Wales, is situated between 52° 5' and 52° 25' N. lat. and between 2° 57' and 3° 25' W. long., and is bounded E. by Hereford and Shropshire, N. by Montgomery, W. by Cardigan, and S. by Brecknock. Its greatest length from north to south is about 30 miles, and its greatest breadth from east to west about 33 miles. The area is 276,552 acres, or 432 square miles.

The greater part of the surface of the county is hilly, and the centre is occupied by a mountainous tract called Radnor Forest, running nearly east and west, its highest summit reaching 2163 feet. Towards the south and south-east the hills are much less elevated and the valleys

widen out into considerable plains, abounding with small rivulets. The hills for the most part present smooth and rounded outlines, but the valley of the Wye is famed for its beauty. The higher ranges are covered with heath, but there is good pasturage on the lower slopes. The smaller elevations are frequently clothed with wood. The prevailing strata are the Lower Silurian rocks; but in the east there is a considerable area occupied by Old Red Sandstone, and throughout the county felspathic ash and greenstone are found, while near Old Radnor there is a large patch of Silurian limestone. Lead and copper are said to exist, but not in quantities sufficient to pay the working. There are saline, sulphurous, and chalybeate wells at Llan-drindod. The Wye enters the county in the north-west, 18 miles from its source in Plinlimmon, and flowing in a south-easterly direction divides it from Brecknock, until it bends north-east and reaches Hay, after which it for some distance forms the boundary with Hereford. Its principal tributary is the Ithon, which flows south-west and joins it 7 miles above Builth. The Teme, flowing south-east, forms the northern boundary of the county with Shropshire. The Llugw, rising in the northern part of the county, flows south-east into Hereford, a little below Presteigne.

Agriculture.—The climate is somewhat damp, and in the spring cold and ungenial. The greater part of the county is suitable only for pasturage, but there is some good arable land in the valleys in the southern and south-eastern districts, which produces excellent crops of turnips, oats, and Welsh barley, the soil being chiefly open shaly clay, although in the east there is an admixture of red sandstone soils. In 1884 there were 156,628 acres, or about five-ninths of the total area, under cultivation, and of these 114,242 acres, or about four-fifths, were in permanent pasture. Of the 21,386 acres under corn crops 12,245 acres, or more than half, were under oats, whilst wheat occupied 5200 acres and barley 3853. Green crops occupied only 7100 acres, of which 1107 were under potatoes and 5682 under turnips. Horses numbered 9249 (3755 used solely for agricultural purposes), cattle 30,917 (10,223 cows and heifers in milk or in calf), and sheep as many as 244,771. The inhabitants are dependent almost solely on agriculture, the manufactures being confined chiefly to coarse cloth, stockings, and flannel for home use.

Railways.—The county is intersected by several lines: the Central Wales Railway runs south-west from Knighton to Llan-dover; another line runs south-eastwards by Rhayader and Builth and joins the Hereford line, which passes by Hay and Talgarth; while another branch line passes by Kington to New Radnor.

Administration and Population.—Radnor comprises six hundreds, but contains no municipal borough. It has one court of quarter sessions and is divided into six petty and special sessional divisions. The ancient borough of Radnor (population 2005) is governed by the provisions of an old charter, and has a commission of the peace. The county contains sixty civil parishes with part of one other, and is partly in the diocese of St David's and partly in that of Hereford. It returns one member to the House of Commons. The population in 1871 was 25,430 and in 1881 it was 23,528, of whom 11,939 were males and 11,589 females. The number of inhabited houses was 4775. The average number of persons to an acre was 0.09 and of acres to a person 11.75.

History and Antiquities.—During the Roman occupation the district was included in the province of Siluria. The Roman road from Chester to Caermarthen entered the northern extremity of the county near Newtown and, following the valley of the Ithon, crossed the Wye and entered Brecknockshire near the town of Builth. There are remains of a Roman station at Cym near Llan-drindod, and at Wapley Hill near Presteigne there is a very good example of a British camp. The district was afterwards included chiefly in Powis, but partly in Gwent and partly in Ferylwg. It was made a county by Henry VIII. Anciently it was called Maesyfedd. The name Radnor is also of very great antiquity, and occurs in the Cambrian annals as early as 1196. There are no ancient castles claiming special notice, and the only ecclesiastical ruin of importance is that of the abbey of Cwm-Hir, founded for the Cistercians in 1143, and occupying a romantic situation in the vale of Clywedog. A considerable portion of the ancient building has been used as materials for the adjoining modern mansion.

RADOM, a government of Poland, occupying a triangular space between the Vistula and the Pilica and bounded on the N. by Warsaw and Siedlce, on the E. by Lublin, on the S. by Austrian Galicia and Kielce, and on the W.

¹ *Sitzungsber. d. k. Ak. in Wien*, 1879.

² *Wiedemann's Ann.*, 1882, xvii.

by Piotrków. The area is 4765 square miles. Its southern part stretches over the hilly plateau of Poland, which consists of short ridges of hills from 800 to 2000 feet in height, intersected by deep valleys, and is known as the Sandomir Heights. These heights are thickly wooded; the valleys, running west and east and watered by several tributaries of the Vistula, are excellently adapted for agriculture. Farther north in its central portion the contour of the government is level, the soil fertile, and the surface, which is diversified here and there with wood, is further broken up by occasional spurs, 800 feet in height, of the Lysa Góra Mountains. The northern districts, where the Pilica joins the Vistula, consist of low flat tracts with undefined valleys, exposed to frequent floods and covered over large areas with marshes; the basin of the Pilica, notorious for its unhealthiness, is throughout a low marshy plain. Devonian, Carboniferous, Permian, and Triassic deposits appear in the southern plateau, Chalk and Jurassic in the middle, and Tertiary in the north. Wide tracts are covered with Glacial deposits,—the Scandinavian erratics reaching as far south as Ilza; these last in their turn are covered with widely spreading post-Glacial lacustrine deposits. The Vistula skirts the government on the south and east and is an important means of communication, several hundreds of light boats (*galary*) descending the river every year, while steamers ply as far up as Sedomierz. The Sedomierz district is occasionally exposed to disastrous inundations of the river. The tributaries of the Vistula (Radomka, Kamienna, and several others) are but short and small, while those of the Pilica are mere streams sluggishly flowing amidst marshes.

The population (644,830 in 1882) is Polish for the most part, one-seventh being Jews. According to creed the proportions are—Roman Catholic 84.0 per cent., Jewish 14.6, Protestant 1.3, and Greek 0.1 per cent. The chief occupation of the inhabitants is agriculture, the principal crops being wheat, oats, rye, potatoes, and beetroot (for sugar). Corn is exported and potatoes largely used for distillation. In 1879 there were 148 manufacturing establishments (197 in 1883), employing 1708 hands, with an aggregate production of 2,121,000 roubles (£212,000), the more important being tanneries, flour-mills, sugar-works, and several machinery and iron-works. These last are suffering, however, from want of wood-fuel, and many of them have recently been closed. Trade is not very extensive, the only channel of commerce being the Vistula. There is no lack of philanthropic institutions within the government—most of them founded early in this century), but nevertheless the sanitary condition of the people is deplorable. *Plaga polonica*, which is endemic in the government of Radom as well as in that of Kielce, is widely diffused, no fewer than 15,000 persons suffering from it, and cognate maladies, such as goitre, scabies, and *tinea capitis*, are also widely prevalent.

The educational institutions include two lycées or gymnasia and two progymnasia (all at Radom), with 813 male and 287 female pupils, a normal school, a theological seminary at Sandomir, and 170 primary schools (112 in villages), with 8465 scholars.

The government is divided into eight districts, the chief towns of which are—Radom, Ilza (2750), Konak (6275), Kozienice (5690), Opatow (5200), Opoczno (5585), and Sedomierz or Sandomir (6265, or 14,710 including suburbs). Zawihvost (3700) is an important custom-house. Ostrowiec (5290), Staszów (6910), Przedborz (6345), and Szydłowice (5290) have municipal institutions.

RADOM, capital of the above government, situated on the Mleczna, a tributary of the Radomka, 65 miles south from Warsaw, is one of the best-built provincial towns of Poland. Lublin Street has a number of fine shops, and there are two well-kept public gardens. The permanent population in 1882 was 12,970, half of whom were Jews, and the town is rapidly growing towards the south-east. Though an old town, Radom has no interesting antiquities. The church of St Wlaclaw, contemporary with the foundation of the town, was transformed by the Austrians into a storehouse, and subsequently by the Russian Government into a military prison. The old castle is in ruins, and the old Bernardine monastery is now used as barracks. The manufactures are unimportant, but trade has been lately increasing.

Radom, which is mentioned in historical documents of the year 1216, at that time occupied the site of what is now Old Radom. New Radom was founded in 1340 by Casimir the Great. Here Jadwiga was elected queen of Poland in 1382, and here too in 1401 the first act relating to the union of Poland with Lithuania was signed; the "seim" of 1505, where the organic law of Poland was sworn by the king, was also held at Radom. Several great fires, and still more the Swedish War, were the ruin of the old city. After the third partition of Poland it fell under Austrian rule; later on, in 1809, it became capital of the Radom department of the grand-duchy of Warsaw. In 1815 it was annexed to Russia and became chief town of the province of Sandomir.

RAEBURN, SIR HENRY (1756-1823), portrait-painter, was born at Stockbridge, a suburb of Edinburgh, on the 4th of March 1756, the son of a manufacturer of the city. He was early left an orphan. Being placed in Heriot's Hospital, he received there the elements of a sound education, and at the age of fifteen was apprenticed to a goldsmith in Edinburgh. Here he had some little opportunity for the practice of the humbler kinds of art, and various pieces of jewellery, mourning rings and the like, adorned with minute drawings on ivory by his hand, are still extant. Soon he took to the production of carefully finished miniatures; and, meeting with success and patronage, he extended his practice to oil-painting, being all the while quite self-taught. The worthy goldsmith his master watched the progress of his pupil with interest, gave him every encouragement, and introduced him to David Martin, who had been the favourite assistant of Allan Ramsay junior, and was now the leading portrait-painter in Edinburgh. Raeburn received considerable assistance from Martin, and was especially aided by the loan of portraits to copy. Soon the young painter had gained sufficient skill to render it advisable that he should devote himself exclusively to art. When in his twenty-second year he was asked to paint the portrait of a young lady whom he had previously observed and admired when he was sketching from nature in the fields. She was the daughter of Peter Edgar of Bridgelands and widow of Count Leslie. The lady was speedily fascinated by the handsome and intellectual young artist, and in a month she became his wife, bringing him an ample fortune. After the approved fashion of artists of the time, it was resolved that Raeburn should visit Italy, and he accordingly started with his wife. In London he was kindly received by Sir Joshua Reynolds, who gave him excellent advice as to his study in Rome, especially recommending to his attention the works of Michelangelo. He also offered him more substantial pecuniary aid, which was declined as unneeded; but Raeburn carried with him to Italy many valuable introductions from the president of the Academy. In Rome he made the acquaintance of Gavin Hamilton, of Batoni, and of Byers. For the advice of the last-named he used to acknowledge himself greatly indebted, and particularly for the recommendation that "he should never copy an object from memory, but, from the principal figure to the minutest accessory, have it placed before him." After two years of study in Italy he returned to Edinburgh in 1787, where he began a most successful career as a portrait-painter. In that year he executed an admirable seated portrait of the second Lord President Dundas.

Of his earlier portraiture we have interesting examples in the bust-likeness of Mrs Johnstone of Baldovie and in the three-quarter-length of Dr James Hutton, works which, if they are somewhat timid and tentative in handling and wanting in the trenchant brush-work and assured mastery of subsequent productions, are full of delicacy and character. The portraits of John Clerk, Lord Eldin, and of Principal Hill of St Andrews belong to a somewhat later period. Raeburn was fortunate in the time in which he practised portraiture. Sir Walter Scott, Blair, Mackenzie,

Woodhouselee, Robertson, Home, Ferguson, and Dugald Stewart were resident in Edinburgh, and they were all, along with a host of others less celebrated, immortalized on the painter's canvas. Of his fully matured manner we could have no finer examples than his own portrait and that of the Rev. Sir Henry Moncreiff Wellwood, the bust of Dr Wardrop of Torbane Hill, the two full-lengths of Adam Rolland of Gask and that of William Macdonald of St Martin's. It was commonly believed that Raeburn was less successful in his female than in his male portraits, but the exquisite full-length of his wife, the smaller likeness of Mrs R. Scott Moncrieff in the Scottish National Gallery, and that of Mrs Robert Bell are sufficient to prove that he could on occasion portray all the grace and beauty of the gentler sex.

Raeburn spent his life in Edinburgh, rarely visiting the metropolis, and then only for brief periods, thus preserving his own sturdy individuality, if he missed the opportunity of engraffing on it some of the fuller refinement and delicacy of the London portraitists. His leisure was employed in athletic sports, in his garden, and in architectural and mechanical pursuits, and so varied were the interests that filled his life that his sitters used to say of him, "You would never take him for a painter till he seizes the brush and palette." Professional honours fell thick upon him. In 1812 he was elected president of the Society of Artists in Edinburgh, in 1814 associate, and in the following year full member of the Royal Academy. In 1822 he was knighted by George IV. and appointed His Majesty's limner for Scotland. He died at Edinburgh on the 8th of July 1823.

In his own day the portraits of Raeburn were excellently and voluminously engraved, especially by the last members of the great school of English mezzotint. In 1876 a collection of over 300 of his works was brought together in the Royal Scottish Academy galleries; in the following year a series of twelve of his finest portraits was included in the winter exhibition of the Royal Academy, London; and a volume of photographs from his paintings has been edited by Dr John Brown.

Raeburn possessed all the necessary requirements of a popular and successful portrait-painter. He had the power of producing a telling and forcible likeness; his productions are distinguished by breadth of effect, by admirable force of handling, by execution of the swiftest and most resolute sort. Wilkie has recorded that, while travelling in Spain and studying the works of Velazquez, the brush-work of that master reminded him constantly of the "square touch" of Raeburn. But the portraits of Velazquez are unsurpassable examples of tone as well as of handling, and it is in the former quality that Raeburn is distinctly wanting. The colour of his portraits is sometimes crude and out of relation, inclining to the use of positive and definite local pigments, and too little perceptive of the changeable subtleties and modifications of atmospheric effect. His draperies frequently consist of little more than two colours—the local hue of the fabric and the black which, more or less graduated, expresses its shadows and modelling. In his flesh, too, he wants—in all but his very best productions—the delicate refinements of colouring which distinguish the works of the great English portrait-painters. His faces, with all their excellent truth of form and splendid vigour of hand, are often hard and brickly in hue.

RAFF, JOSEPH JOACHIM (1822-1882), composer and orchestral conductor, was born near Zurich on 27th May 1822 and educated chiefly at Schwyz. Here, under the care of the Jesuit fathers, he soon became an excellent classical and mathematical scholar, but received scarcely any instruction in his favourite art, in which, nevertheless, he made extraordinary progress through sheer force of natural genius, developed by persevering study which no external obstacles could induce him to discontinue. So successful were his unaided efforts that, when in 1843 he sent some MSS. to Mendelssohn, that warm encourager of youthful talent felt justified in at once recommending him to Breitkopf & Härtel of Leipsic, who published a large selection of his early works. Soon after this he became acquainted with Liszt, who gave him much generous

encouragement. He first became personally acquainted with Mendelssohn at Cologne in 1846, and gave up all his other engagements for the purpose of following him to Leipsic, but his intention was frustrated by the great composer's death in 1847. After this cruel disappointment he remained for some time at Cologne, where his attention was alternately devoted to composition and to the preparation of critiques for the well-known periodical *Cäcilia*. Thus far he must be regarded as, in every sense of the word, a self-taught artist; but he felt the need of systematic instruction so deeply that, retiring for a time from public life, he entered at Stuttgart upon a long course of severe and uninterrupted study, and with so great success that in 1850 he appeared before the world in the character of an accomplished and highly-cultivated musician. Raff now settled for a time in Weimar in order to be near Liszt. Hans von Bülow had already brought him into notice by playing his *Concertstück* for pianoforte and orchestra in public, and the favour with which this fine work was everywhere received encouraged him to attempt a greater one. During his stay in Stuttgart he had begun the composition of an opera entitled *König Alfred*, and had good hope of securing its performance at Dresden; but the political troubles with which Germany was then overwhelmed rendered its production in the Saxon capital impossible. At Weimar he was more fortunate. In due time *König Alfred* was produced there under Liszt's able direction with complete success; it is still frequently performed at the court theatre, as is also his second opera, *Dame Kobold*, written for the same theatre in 1870. His third opera, *Samson*, has not yet, we believe, been publicly represented.

Raff remained at Weimar until 1856, when he obtained a large *clientèle* at Wiesbaden as a teacher of the pianoforte. In 1859 he married Doris Genast, an actress of high repute, and thenceforward devoted himself with renewed energy to the work of composition, displaying an inexhaustible fertility of invention tempered by an amount of technical skill which stamped even his lightest works with the dignity to which the union of natural talent with high artistic cultivation can alone give birth. He resided chiefly at Wiesbaden till 1877, when he was appointed director of the Hoch-Conservatorium at Frankfurt, an office which he retained until his death, 25th June 1882.

Raff's compositions are almost innumerable. More than 200 have been published, including ten symphonies—undoubtedly his finest works—quartets, concertos, sonatas, songs, and examples of nearly every known variety of style; yet he never repeats himself. Notwithstanding his strong love for the romantic school, he is never guilty of extravagance, and, if in his minor works he is sometimes a little commonplace, he never descends to vulgarity. His symphonies *Lenore* and *Im Walde* are truly wonderful examples of musical painting, and replete with poetry in every bar.

RAFFLES, SIR THOMAS STAMFORD (1781-1826), the son of a captain in the West India trade, was born at sea off the coast of Jamaica on 5th July 1781. Returning with his mother to England, he was placed in a boarding-school at Hammersmith, where he remained till the age of fourteen, when he entered the East India House as an extra clerk. While employed there he occupied his leisure hours in particularly studying languages, for which he possessed great facility. In 1805 the directors of the India House having resolved to found a new trading settlement at Penang, Raffles was appointed assistant-secretary, and on his voyage out he acquired the Malay language. Owing to the illness of the chief secretary, he soon had to undertake the entire administrative labour of the new government. In 1808 he had to visit Malacca to recruit his shattered strength; here he enjoyed large opportunity of mingling with a very varied population, and, in company with the two Orientalists Marsden and

Leyden, he began his elaborate researches into the history, laws, and literature of the Hindu and Malay races. In zoology he took special interest, and on his return to England became founder and first president of the Zoological Society. While in Calcutta in 1809, Raffles suggested to Lord Minto, then governor-general of India, the desirableness of wresting Java from the French. The governor-general took up the idea with vigour; a fleet of ninety ships dropped anchor before Batavia in August 1811, and in a short time the conquest of the island was effected. Raffles was made lieutenant-general of the new territory, and resolved to give to the island a pure and upright administration. There were three sources of abuse to eradicate—the revenue system, the system of police and public justice, and the slave trade. In a period of only five years Raffles had almost effected his design; his popularity was secured, and the revenue was eight times larger than it had been under the Dutch. The policy of some of his measures being, however, considered doubtful by the home authorities, he was recalled in 1816, but his conduct was approved. He published a valuable and well-illustrated *History of Java*, in 2 vols. 4to, 1817.

Having received knighthood, Sir Stamford Raffles set out for Sumatra as lieutenant-governor of Bencoolen, arriving in March 1818, and immediately recommenced the work of reform. In 1819 he induced the marquis of Hastings to annex Singapore. He again visited Singapore, his "political child," in 1822, and occupied himself for nearly a year in laying out the new city, and in establishing its constitution as a free port. Java had been given up to the Dutch shortly after Sir Stamford left it, and now Bencoolen was granted to them in exchange for Malacca. On setting sail for England from Sumatra in February 1824 the ship took fire and the crew and passengers were with difficulty saved. The loss to Sir Stamford was beyond all repair. The whole of his drawings, all his collections in botany and zoology, all his multitudinous papers and manuscripts, fell a prey to the flames, his pecuniary loss amounting to more than £20,000. During one of his excursions into the interior of Sumatra, in company with Dr Arnold, he came upon the largest and most extraordinary of known flowers, the *Rafflesia Arnoldi* (see PARASITISM, vol. xviii. p. 265). In 1820 he sent home a large collection of preserved animals, now in the museum of the London Zoological Society, described in the *Transactions* of the Linnean Society. He died of apoplexy at his house near London on 5th July 1826.

RAFN, CARL CHRISTIAN (1795-1864), Danish archaeologist, was born in Brahesborg, Fünen, on 16th January 1795 and died at Copenhagen on 20th October 1864. He is chiefly known in connexion with the controversy as to the question of the discovery of America by the Norsemen. (See AMERICA, vol. i. p. 706.)

RAGATZ, or RAGAZ, a watering-place in Switzerland, in the canton of St Gall, with a station on the railway to Coire, 64 miles south-east of Zurich, stands 1700 feet above the sea at the mouth of the magnificent gorge through which the impetuous Tamina forces its way to the Rhine; its baths are supplied with mineral water from the hot springs of Pfäfers, which issue from the right side of the ravine 2½ miles higher up. As the tourist centre for one of the most picturesque districts of Switzerland, Ragatz has greatly increased since the middle of the century. It had then only 650 inhabitants; in 1870 there were 1825, and in 1880 1996, while the annual number of visitors is about 50,000. In the churchyard is the grave of Schelling, who died at Ragatz in 1854. Ragatz originally belonged to the abbots of the Benedictine monastery of Pfäfers (713-1838); their residence became in 1840 the "Hof Ragatz" hotel, and in 1868 the whole

property, which had been seized by the state in 1838, passed into private hands. The Swiss defeated the Austrians at Ragatz in 1446.

RAGLAN, FITZROY JAMES HENRY SOMERSET, BARON (1788-1855), English general, was the eighth and youngest son of the fifth duke of Beaufort by Elizabeth, daughter of Admiral the Hon. Edward Boscawen, and was born on 30th September 1788. He entered the army in 1804. In 1807 he was attached to the Hon. Sir Arthur Paget's embassy to Turkey, and the same year he was selected to serve on the staff of Sir Arthur Wellesley in the expedition to Copenhagen. In the following year he accompanied the same general in a like capacity to Portugal, and during the whole of the Peninsular War was at his right hand, first as aide-de-camp and then as military secretary. He specially distinguished himself at the storming of Badajoz, being the first to mount the breach, and it was to him that the governor delivered up his sword. During the short period of the Bourbon rule in 1814 and 1815 he was secretary to the English embassy at Paris. On the renewal of the war he again became aide-de-camp and military secretary to the duke of Wellington. At Waterloo he lost his right arm by a shot, but he quickly gained the facility of writing with his left hand, and on the conclusion of the war resumed his duties as secretary to the embassy at Paris. From 1818 to 1826 he sat in the House of Commons as member for Truro. In 1819 he was appointed secretary to the duke of Wellington as master-general of the ordnance, and from 1827 till the death of the duke in 1852 was military secretary to him as commander-in-chief. He was then appointed master-general of the ordnance, and shortly afterwards was raised to the House of Lords as Baron Raglan. In 1854 he was appointed to the command of the English troops sent to the Crimea. Here the advantage of his training under the duke of Wellington was seen in the soundness of his military tactics, but the trying winter campaign in the Crimea also brought into prominence defects perhaps traceable to his long connexion with the formalities and uniform regulations of military offices in peace time. At the same time the hampering influence of a divided command must be taken into account, and it ought not to be forgotten that, if his advice had been adopted by the French at the beginning, Sebastopol would very probably have fallen in a few weeks after the landing of the allies. His suggestion was to march straight upon the north side of Sebastopol, but after the battle of Alma on 20th September the plan was abandoned, and the south side was reached by the desperate expedient of a perilous flank march. For the hardships and sufferings of the English soldiers in the terrible Crimean winter owing to a failure in the commissariat, both as regards food and clothing, Lord Raglan and his staff were at the time severely censured by the press and the Government; but, while Lord Raglan was possibly to blame in representing matters in a too sanguine light, it afterwards appeared that the chief neglect rested with the home authorities. The monotony of the siege was broken by the battles of Balaklava on 26th October and of Inkermann on 5th November, in which the accurate and rapid decision of Lord Raglan changed impending disasters into brilliant victories. During the trying winter of 1854-55 the suffering he was compelled to witness, the censures, in great part unjust, which he had to endure, and all the manifold anxieties of the siege seriously undermined his health, and he died of dysentery on 28th June 1855.

See Kinglake's *History of the Invasion of the Crimea*.

RAGMAN ROLLS, the name given to the collection of instruments by which the nobility and gentry of Scotland were compelled to subscribe allegiance to Edward I of

England between the conference of Norham in May 1291 and the final award in favour of Baliol in November 1292, and again in 1296. Of the former of these records two copies were preserved in the chapter-house at Westminster (now in the Record Office, London), and it has been printed by Rymer (*Fœdera*, ii. 542). Another copy, preserved originally in the Tower of London, is now also in the Record Office. The latter record, containing the various acts of homage and fealty extorted by Edward from Baliol and others in the course of his progress through Scotland in the summer of 1296 and in August at the parliament of Berwick, was published by Prynn from the copy in the Tower and now in the Record Office. Both records were printed by the Bannatyne Club in 1834. The derivation of the word "ragman" has never been satisfactorily explained, but various guesses as to its meaning and a list of examples of its use for legal instruments both in England and Scotland will be found in the preface to the Bannatyne Club's volume, and in Jamieson's *Dictionary*, s.v. "Ragman." The name of "Ragman" has been sometimes confined to the record of 1296, of which an account is given in *Calendar of Documents relating to Scotland preserved in the Public Record Office, London* (1884), vol. ii, Introd., p. xxiv.; and as to the seals see p. lii. and appendix.

RAGUSA (Slavonic *Dubrovnik*, Turkish *Paprovnik*), a city on the east coast of the Adriatic, for many centuries an independent republic, now at the head of a district in the province of Dalmatia in Austria-Hungary. It is built close to the sea at the foot of the bare limestone mass of Monte Sergio, on which stands an unfinished Fort Impérial erected by the French. In front lies the island of Locrina, the traditional landing-place of Cœur-de-Lion. Several ancient stone-built forts—San Lorenzo (11th century), Leverono (16th), &c.—defend the harbour, and the city is fenced in with lofty walls. The main street runs in a narrow valley between the mountain and a seaward ridge; the valley was up till the 13th century a channel of the sea, and the seaward ridge was the rocky island of Lavve or Ragusa proper, opposite which lay among its pine trees the Slavonic settlement of Dubrovnik. Though still a fine street, this corso is not so imposing as before its palatial mansions were overthrown by the earthquake of 1667. It contains a 15th-century cistern, a church (Del Redentore) erected after the earthquake of 1536 to avert similar catastrophes, and a Franciscan monastery; and in the piazza off its southern extremity are the Palazzo Rettorale, or residence of the "rectors" of the republic (1435-52), the old custom-house and mint, completed in 1520, and the Torre del Orologio, with its curious clock. The "palace" is a marvellous specimen of late Romanesque influence, especially famous for the six columns of its façade and the alchemist group with which one of the capitals is decorated; and the custom-house has also a fine Romanesque element in its style. The cathedral (dedicated to the Virgin Mary, though the patron saint of the city is St Blasius, whose effigy perpetually occurs on its coins, fortifications, and churches) is a building in the Italian taste of the 18th century. Ragusa can never have been a large city. In the 16th century it is said to have contained 30,000 or 40,000 inhabitants; in 1881 it had only 7245, and its commune, with its fifteen additional villages, 10,936. The harbour, once one of the great ports of southern Europe, is altogether too small for modern requirements, in spite of the new breakwater constructed in 1873 to protect it from the south-west winds. From 400 to 600 vessels (mostly under 50 tons burden) enter yearly. The neighbouring harbour of Gravosa (Slav *Gruž*; population 677) is the real port of Ragusa as far as steam-boat traffic is concerned. The staple trade is that of oil; but the whole supply is sent to the Trieste market.

Ragusan Malmsey, once famous, has disappeared before the vine-disease since 1852.

The history of Ragusa has been thus summarized by Mr Freeman:—"Those hills, the slopes of which begin in the streets of the city, once fenced in a ledge of Hellenic land from the native barbarians of Illyricum. Then they fenced in a ledge of Roman land from the Slavonic invader. Lastly they still fence in a ledge of Christian land from the dominion of the infidel." The city was founded on a rocky island by Roman Christian refugees from Epidaurus (now Ragusa Vecchia, 675 inhabitants), in the middle, say some, of the 3d century after Christ; and in the middle of the 7th century it was strengthened by other refugees from Salona, destroyed by the Slavs. In course of time a Slavic settlement was incorporated within its walls; and thus by language and sympathies it became a link between two great civilizations. Ragusa¹ maintained its independence against all comers partly by war but more by diplomacy. In the 9th century it more than once repulsed the Saracens, and in the 10th defended itself against Venice, the pirates of the Narenta, Samuel (czar of the Bulgarians), and the emperor Otho; in the 11th century it was drawn by its alliance with Robert Guiscard into a war with Byzantium and Venice, and in the 12th century fought with the ban of Bosnia and with Stephen Nemanya of Serbia, who twice invested the city. But its policy was generally peaceful. To refugees of all nations, even to those who had been its own bitter foes, it afforded asylum; and by means of treaty and tribute it gradually worked its way to a position of mercantile power which Europe could hardly parallel. A compact which it made with the Turkish ruler at Broussa in 1370 was renewed by Bajazet in the 15th century and saved the little state from the fate of her most powerful neighbours, Byzantium and Serbia. By that time Ragusa had stations at Serai, Bucharest, Tirgovisce, Widdin, Rustchuk, Sophia, and Adrianople; and her vessels were known not only in Italy, Sicily, Spain, Greece, and the Levant, but in the more northern parts of Europe. Our own language retains in the word "argosy" a relic of the caracks of Ragusa, then known to Englishmen as Argouse, Argusa, or Aragosa. As the world widened the Ragusan merchants went farther,—to India, even, and America. But the finest vessels of their fleet were compelled to join the Spanish Armada and shared its fate; and the city, which had felt shocks of earthquake in 1520, 1521, 1536, and 1639, was in April 1667 laid utterly in ruins and lost a fifth of its inhabitants. "The rector of the republic, five-sixths of the nobles, nine-tenths of the clergy, a Dutch ambassador with his suite of thirty-three on his way to Constantinople, and 6000 citizens were buried." Ragusa never quite recovered its prosperity, though it was again a busy trading town of 15,000 inhabitants when Napoleon seized it in 1806. In 1808 it was deprived of its independence; and by the congress of Vienna in 1814 it was assigned to Austria. This is not the place to describe the remarkable literary development, Latin, Italian, and Slavonic, of which Ragusa was the centre in the 15th, 16th, and 17th centuries, and to which so many of its patricians contributed; a detailed account will be found in Pypin and Spasovich's *History of Slavic Literatures* (German edition, 1880). Gondulic (Gondola) the poet and Boscovich the mathematician are leading names.

See Engel, *Geschichte von Ragusa* (Vienna, 1807); Makusheff, *Investigations into the Historical Documents of Ragusa* (in Russian, St Petersburg, 1867); *Movimenta hist. Slavorum meridionalium* (Warsaw, 1864); Appendix, *Notizie storico-crit. sulle antichità, &c., del Ragusel* (Ragusa, 1802-3); Sir Gardner Wilkinson, *Dalmatia*; A. A. Faton, *The Danube and Adriatic*; J. A. Evans, *Thru' Bosnia and the Herzegovina*, 1876; E. A. Freeman, *Subject and Neighbour Lands of Venice*, 1881.

RAGUSA, a city of Italy in the province of Syracuse (Sicily), 16 miles east of Vittoria and 10 north-north-west of Modica, lies on the right side of the valley of the Ragusa or Erminio (Herminius). It consists of an upper town with 24,183 inhabitants and a lower town with 6260 (1881), the two communes having a total population of 30,720. The church of Santa Maria della Scala is in part modern, but in part of considerable antiquity and interest; and San Giorgio contains the tomb of Bernardo Caprera (ob. 1423), who tried to seize the crown of Sicily. Ragusa possesses a large cotton-factory. Stone impregnated with petroleum is quarried in the Grotta Oleosa in the neighbourhood, and after the oil is burned out becomes an article of export under the name of *pietra nera*. The city, which was destroyed by earthquake in 1693, is of considerable antiquity, as is proved by the numerous ancient tombs existing in the district; but whether it is to be identified with Hybla Heræa is matter of opinion.

¹ The name, of unknown origin, appears as Rhaugia, Rhaugium, Rhausium, Ragusium, Lavusa, Labuda, Labusædum, &c.

RAHEL. See VARNHAGEN VON ENSE.

RAHWAY, a city of the United States in Union county, New Jersey, 19 miles by rail south-west of New York, lies on Rahway river at the head of schooner navigation, about 4 miles above its mouth in Staten Island Sound. It is best known for its carriage-factories, but has also a wool-mill, a printing-press manufactory, a printing-house, a shirt-factory, a hunting-goods factory, &c. The population was 6258 in 1870 and 6455 in 1880. First settled in 1720 and named after Rahwack, the Indian owner of the site, Rahway was incorporated as a city in 1858.

RAI BARELI or ROY BAREILLY, a district of British India, in the Rai Bareli division¹ of Oudh, under the jurisdiction of the lieutenant-governor of the North-Western Provinces, has an area of 1738 square miles. It lies between 25° 49' and 26° 35' N. lat. and between 80° 45' and 81° 40' E. long., and is bounded on the N. by the districts of Lucknow and Bara Banki, on the E. by Sultanpur, on the S. by Partabgarh and the Ganges, and on the W. by Unao. The general aspect of the district is slightly undulating, and the country is beautifully wooded; in fact, the beauty of the country is not to be surpassed by any part of the real plain of Hindustan. The soil is remarkably fertile, and the cultivation of a high class. The principal rivers of the district are the Ganges and the Sai: the former skirts it for 54 miles and is everywhere navigable for boats of 40 tons; the latter traverses it from north-west to south-east, a distance of 55 miles. Other rivers are the Basha, the Loni, and the Naiya. The indigenous products of Rai Bareli consist of several magnificent and useful timber trees, numerous kinds of grazing and thatching grasses, and a variety of rice known as "pasahi," which grows wild in many tanks and marshes; its jungle products are lac and silk cocoons. Herds of wild cattle are to be found in the south of the district, near the Sai river, and do much harm to the crops; nylgau are common near the Ganges, and wolves are occasionally met with in the jungles.

According to the census of 1881 Rai Bareli district contains a population of 951,905 (males 466,906, females 484,999). By religion 874,180 are Hindus, 77,424 Mohammedans, and 123 Christians. The most numerous castes are the Ahirs (114,869), the Brahmins (113,212), and the Rajputs (70,757). Compared with other Oudh districts, the proportion of high castes is large, which is accounted for by the fact that Rai Bareli was for centuries the seat of Hindu authority and but little controlled by the Mohammedan kings. The population is almost entirely rural, there being only three towns with a population exceeding 5000, viz., Rai Bareli (see below), Jais (11,044), and Dalmau (5367). The principal occupation of the people is agriculture. Of the total area 892 square miles were in 1882 returned as cultivated, 432 as cultivable, and 414 square miles as uncultivable. The greater portion of the cultivated area is two-crop land. The principal crops are rice, wheat, gram, arhar, and pease. In years of scarcity Rai Bareli is worse off than other districts, having no railway and only some 56 miles of water communication along its border. On the other hand, its masonry wells afford it a greater assurance against famine; its drainage is superior to that of other districts; it suffers comparatively less from floods; and its area of artificial irrigation is so large that absolute famine ought to be almost unknown. The average rainfall of the district is 37 inches; the rainfall is, however, very capricious and often deficient in the very months when it is most needed for agricultural purposes. Although possessing no railway communication, the district is well opened up by roads. Its gross revenue in 1882 was £153,072, of which £129,841 was derived from the land-tax. There are little trade and few manufactures, except cloth-weaving for local use, the making of brass and copper utensils, and glass ware.

RAI BARELI or ROY BAREILLY, town and administrative headquarters of the above district, is situated on the

banks of the Sai in 26° 14' N. lat. and 81° 17' E. long. It was founded by the Bhars, who called it Bharauli, but it was subsequently corrupted into Bareli. The prefix "Rai" is either derived from Rahi, a village near the town, or from the fact of its having been long in the possession of a Kayasth family bearing the name of Rai. The population of the town (1881) is 11,781 (males 5970, females 5811). It possesses many architectural features, chief of which is a spacious and strong fort erected in 1403, and constructed of bricks 2 feet long by 1 foot thick and 1½ wide. Among its ancient buildings are the magnificent palace and tomb of Nawab Jahan Khan, the governor in the time of Aurangzeb, and four fine mosques.

RAIKES, ROBERT (1735-1811), the founder of Sunday schools, was the son of Robert Raikes, a printer in Gloucester and proprietor of the *Gloucester Journal*, and was born on 14th September 1735. On the death of his father in 1757 he succeeded him in the business, which he continued to conduct till 1802. Along with some others he started a Sunday school at Gloucester in 1780, and on his giving publicity to the enterprise in the columns of his journal the notice was copied into the London papers, and awakened considerable attention. For nearly thirty years he continued actively engaged in the promotion of his undertaking, and he lived to witness its wide extension throughout England. He died on 5th April 1811. Among various accounts of the life and work of Raikes mention may be made of that by P. M. Eastman, 1880.

RAIL (German *Ralle*, French *Râle*, Low Latin *Rallus*), originally the English name of two birds, distinguished from one another by a prefix as Land-Rail and Water-Rail, but latterly applied in a much wider sense to all the species which are included in the Family *Rallidae* of Ornithology.

The LAND-RAIL, also very commonly known as the Corn-Crake, and sometimes as the Daker-Hen, is the *Rallus crex* of Linnæus and *Crex pratensis* of recent authors. Its monotonous grating cry, which has given it its common name in several languages, is a familiar sound throughout the summer nights in many parts of the British Islands; but the bird at that season very seldom shows itself, except when the mower lays bare its nest, the owner of which, if it escape beheading by the scythe, may be seen for an instant before it disappears into the friendly covert of the still standing grass. In early autumn the partridge-shooter not unfrequently flushes it from a clover-field or tangled hedgerow; and, as it rises with apparent labour and slowly flies away to drop into the next place of concealment, if it fall not to his gun, he wonders how so weak-winged a creature can ever make its way to the shores if not to the interior of Africa, whither it is almost certainly bound; for, with comparatively few individual exceptions, the Land-Rail is essentially migratory—nay more than that, it is the *Ortygometra* of classical authors—supposed by them to lead the QUAIL (*supra*, p. 146) on its voyages—and in the course of its wanderings has now been known to reach the coast of Greenland, and several times that of North America, to say nothing of Bermuda, in every instance we may believe as a straggler from Europe or Barbary. The Land-Rail needs but a brief description. It looks about as big as a Partridge, but on examination its appearance is found to be very deceptive, and it will hardly ever weigh more than half as much. The plumage above is of a tawny brown, the feathers being longitudinally streaked with blackish brown; beneath it is of a yellowish white; but the flanks are of a light chestnut. The species is very locally distributed, and in a way for which there is at present no accounting. In some dry upland and corn-growing districts it is plentiful; in others, of apparently the same character, it but rarely occurs; and

¹ Rai Bareli division comprises the three districts of Rai Bareli, Sultanpur, and Partabgarh, and contains an area of 4882 square miles, with a population (1881) of 2,756,864 (males 1,362,761, females 1,394,103). The great majority of the people are Hindus, of whom there are 2,493,536; the Mohammedans number 262,892 and the Christians 226.

the same may be said in regard to low-lying marshy meadows, in most of which it is in season always to be heard, while in others having a close resemblance to them it is never met with. The nest is on the ground, generally in long grass, and therein from nine to eleven eggs are commonly laid. These are of a cream-colour, spotted and blotched with light red and grey. The young when hatched are thickly clothed with black down, as is the case in nearly all species of the Family.

The WATER-RAIL, locally known as the Skiddy or Bill-cock, is the *Rallus aquaticus* of Ornithology, and seems to be less abundant than the preceding, though that is in some measure due to its frequenting places into which from their swampy nature men do not often intrude. Having a general resemblance to the Land-Rail,¹ it can be in a moment distinguished by its partly red and much longer bill, and the darker coloration of its plumage—the upper parts being of an olive brown with black streaks, the breast and belly of a sooty grey, and the flanks dull black barred with white. Its geographical distribution is very wide, extending from Iceland (where it is said to preserve its existence during winter by resorting to the hot springs) to China; and though it inhabits Northern India, Lower Egypt, and Barbary, it seems not to pass beyond the tropical line. It never affects upland districts as does the Land-Rail, but always haunts wet marshes or the close vicinity of water. Its love-note is a loud and harsh cry, not continually repeated as is that of the Land-Rail, but uttered at considerable intervals and so suddenly as to have been termed “explosive.” Besides this, which is peculiar to the cock-bird, it has a croaking call that is frog-like. The eggs resemble those of the preceding, but are more brightly and delicately tinted.

The various species of Rails, whether allied to the former or latter of those just mentioned, are far too numerous to be here noticed. Hardly any part of the world is without a representative of the genera *Crex* or *Rallus*, and every considerable country has one or

perhaps more of each—though it has been the habit of systematists to refer them to many other genera, the characters of which are with difficulty found. Thus in Europe alone three other species allied to *Crex pratensis* occur more or less abundantly; but one of them, the Spotted Rail or Crake, has been made the type of a so-called genus *Porzana*, and the other two, little birds not much bigger than Larks, are considered to form a genus *Zapornia*. The first of these, which used not to be uncommon in the eastern part of England, has a very near representative in the Carolina Rail or Sora, *Crex carolina*, of North America, often there misnamed the Ortolan, just as its European analogue, *C. porzana*, is in England often termed the Dotterel. But, passing over these as well as some belonging to genera that can be much better defined, and other still more interesting forms of the Family, as *Aphanapteryx* (BIRDS, vol. iii. p. 733), COOT (vol. vi. p. 341), MOOR-HEN (vol. xvi. p. 808), and OXYDROME (vol. xvii. p. 722), a few words must be said of the more distant group formed by the South-American *Heterornis*, and the African and Indian *Podica*, comprising four or five species, to which the name “Finfoots” has been applied—from the lobes or flaps of skin that fringe their toes. Though for a long while placed among the *Podicipedidae* (GREBE, vol. xi. p. 79), their osteology no less than their habits appear to indicate their alliance with the Rails, if they be not members of the Family *Rallidae*; but they seem to shew the extreme modification of that type in adaptation to aquatic life. Then again the curious genus *Mesites* of Madagascar, whose systematic place has been so long in doubt, has been referred by Prof. Alph. Milne-Edwards (*Ann. Sc. Naturelle*, ser. 6, vii. art. 2) to the neighbourhood of the Rails, though offering some points of resemblance to the Herons. On the other hand the Jacanas (vol. xiii. p. 531) or *Parridae*, which from their long toes were once thought to belong to the Rails, are now generally admitted to be Limicoline, while the genus *Aramanus*—the Courlan or Limpkin of the Southern United States—still occupies a very undetermined position. On the whole the *Rallidae* constitute a group of birds which, particularly as regards their relations to some other remarkable forms, of which the Sun-Bittern, *Eurypyga*, and Kagu, *Rhinoceros*, may especially be named, well deserve greater attention from the systematist, and any ornithologist in want of a subject could hardly find one more likely to reward his labours if he were only to carry them out in a judicious way. Based on the safe ground of anatomy, but due regard being also had to the external characters, habits, and other peculiarities of this multifarious group, a monograph might be produced of surpassing interest, and one that in its bearings on the doctrine of evolution would be likely to prove a telling record. (A. N.)

RAILWAY

RAILWAYS had their origin in the tramways which were laid more than two hundred years ago in the mineral districts of England for the conveyance of coal to the sea. In those days, before Macadam, roads bearing heavy traffic were with difficulty kept in repair. This led to the plan of laying planks or timbers at the bottom of the ruts as a better contrivance than filling in with stones, and then to laying rails of timber on the level surface. In 1676 tramways consisted of rails of timber laid “from the colliery to the river, exactly straight and parallel, and bulky carts were made with four rollers fitting the rails, whereby the carriage was so easy that one horse would draw down four or five chaldron of coals.” The rails originally were formed of scantlings of good sound oak, and were connected by sills or cross timbers of the same material pinned together with oak trenails. By and by an additional or wearing rail, which could be easily renewed when worn, was placed above the supporting rail, and it was then possible to cover the cross pieces or sleepers with earth to protect them from the horses’ feet. These ways, laid by permission of local proprietors, were called “way-leaves.” It became a common practice to nail down bars of wrought iron on the surfaces of the ascending inclines of the road. These bars or rails were about 2 inches wide and half an inch thick, and were fastened to the wood rails by countersunk spikes. But the iron bars, not being stiff enough,

were considerably bent when the trucks were loaded, and the resistance was reduced but slightly below that of a well-constructed double wooden tramway.² Nevertheless, while the regular load of coals for one horse on the common road was but 17 cwt., on the tramway the horse could regularly take a load of 42 cwt. Cast-iron was first tried for rails in 1767 by the Coalbrookdale Iron Company. The iron rails were cast in lengths of 5 feet, 4 inches wide, and 1½ inches thick, formed with three holes, through which they were fastened to the oak rails. The tramway was developed into the railway by the employment of cast-iron flange rails (fig. 1) to replace the wooden rails; the continuous flange or ledge on their inner edge kept the wheels on the track. The roads were then called tram-roads, probably as an abbreviation of trammel-roads, the flanges of the rails being in reality trammels to gauge the road and confine the wheels to

FIG. 1.—The tram-road, 1776-1800.

¹ Formerly it seems to have been a popular belief in England that the Land-Rail in autumn transformed itself into a Water-Rail, resuming its own characters in spring. The writer has met with several persons who had serious doubts on the subject!

² The earliest system of way on the Baltimore and Ohio Railroad and other railroads in the United States was a simple reproduction of this compound of wood and iron. As the ends of the bars became loose and turned upwards they were known as “snakes’ heads.” Occasionally they pierced the floors of the carriages and injured passengers.

the track. The leading objection to this system was that the rail was liable to be covered with dust. Jessop therefore in 1789 laid down at Loughborough cast-iron "edge rails," raised above the ground so as to allow a flanged cast-iron wheel to run on them (fig. 2). This appears to have been the first system of rails laid on cast-iron chairs and on sleepers. The rails were pinned or bolted into the chairs. A wrought-iron rail was patented by Birkenhead in 1820, as the "fish-belly" rail, similar in form and mode of support to Jessop's rail, but rolled in continuous lengths, embracing a number of spans, with stiffening ledges or flanges on the

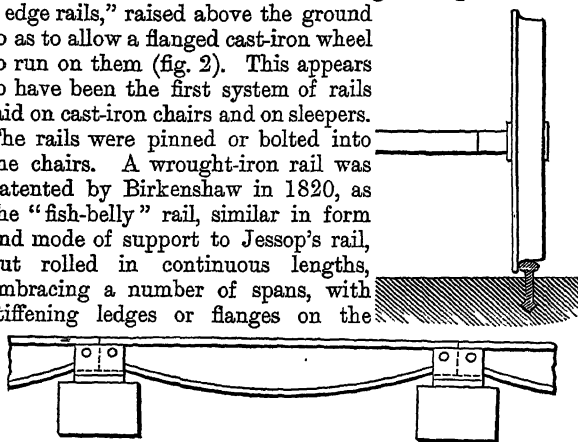

FIG. 2.—The edge rail, 1789.

under side. This form of rail grew into favour. It weighed 33 lb per yard, and was laid in cast-iron chairs, spiked down to square stone blocks at 3-foot bearings (see fig. 3). The edge rail and the flanged wheel constitute the basis of the whole system of a railway. The rails forming a line of way were placed to a gauge or distance apart of 4 feet 8½ inches, and two parallel lines of way were spaced with 6 feet between the inner rails of the ways. This interspace is popularly known as the "six-foot."

FIG. 3.—The fish-belly rail, 1820-30.

The benefits derived from the use of the tramway or railway for the transport of coal suggested to reflective persons the employment of it for the conveyance of general merchandise and of passengers. For the conveyance of heavy merchandise inland the canals little more than sixty years ago furnished the principal means. Though there were three such water-routes between Liverpool and Manchester, they were sometimes so crowded that cotton took a month to pass from the seaport to the manufacturing towns in the interior; yet the whole of the merchandise passing between Liverpool and Manchester did not average more than 1200 tons a day. The average rate of carriage was 18s. per ton, and the average time of transit on the 50 miles of canal was thirty-six hours. The conveyance of passengers by the improved coach-roads was comparatively rapid, but it was very costly. The first great movement to mend this state of things was the passing of the Act in 1821 for the construction of the Stockton and Darlington Railway. Colliery railways were in evidence to prove the benefits of railway communication by steam-power. The Hetton Railway, for instance, in the neighbourhood of Newcastle, from the colliery to the river Wear, was 7 miles long, and trains of 60 tons net weight were taken over the line at a speed of 4½ miles per hour. On the Killingworth Railway an engine and tender weighing 10 tons drew a load of 40 tons at a speed of 6 miles per hour, consuming 50 lb of coal per mile run. Whilst animal-power only was at first relied on for working the Stockton and Darlington

Railway, the Act provided for working with men and horses or "otherwise." By another Act applied for at the request of George Stephenson, who became engineer to the line, the company was empowered to work the railway with locomotive engines. The line, with three branches, was over 38 miles in length, and was at first laid as a single line, with passing places at intervals of a quarter of a mile, the way being constructed with wrought-iron fish-belly rails, weighing 28 lb per yard. It was opened in September 1825 by a train of thirty-four vehicles, making a gross load of about 90 tons, drawn by one engine driven by Stephenson, with a signalman on horseback in advance. The train moved off at the rate of from 10 to 12 miles an hour, and attained a speed of 15 miles per hour on favourable parts of the line. A train weighing 92 tons could be drawn by one engine at the rate of 5 miles per hour. The principal business of the new railway was the conveyance of minerals and goods, but from the first passengers insisted upon being carried, and in October 1825 the company began to run a daily coach, called the "Experiment," to carry six inside, and from fifteen to twenty outside, making the journey from Darlington to Stockton and back in two hours. The fare was 1s., and each passenger was allowed to take baggage not exceeding 14 lb weight. The rate for carriage of merchandise was reduced from 5d. to one-fifth of a penny per ton per mile, and that of minerals from 7d. to 1½d. per ton per mile. The price of coals at Darlington fell from 18s. to 8s. 6d. per ton.

The Monklands Railway in Scotland, opened in 1826, Earliest was the first to follow the example of the Stockton and Darlington line, and several other small lines—including the Canterbury and Whitstable, worked partly by fixed engines and partly by locomotives—quickly adopted steam-traction. But the inauguration of the Liverpool and Manchester Railway, opened in 1830, made the first great impression on the national mind that a revolution in the modes of travelling had really taken place. In 1838 a line was opened between London and Birmingham, and the first train accomplished the whole distance—112½ miles—at an average speed of over 20 miles per hour. The London and Greenwich, the London and Southampton, the Great Western, Birmingham and Derby, Bristol and Exeter, Eastern Counties, Manchester and Leeds, Grand Junction, Midland Counties, North Midland, South-Eastern, London and Brighton, Manchester and Birmingham, and Edinburgh and Glasgow, together with many small Bills, were all passed within four years from the time of the passing of the London and Birmingham Bill. Thus in the course of four or five years the foundations were laid of most of the existing trunk lines of railway in Great Britain. The original Liverpool and Manchester line, 30½ miles in length, now forms part of a network of lines, the property of one company, nearly 1800 miles in extent, representing a capital invested in railway works and plant of £100,000,000.

Meantime the construction of the way was the subject Kind of of much consideration. The fish-belly form of wrought-iron rail was troublesome to roll, and so the flat-bottom or flat-foot rail (fig. 4) was designed, combining a solid head with a flange base. This rail, with holes through the flange to hold the spikes, was used to some extent, and was laid on longitudinal timber sleepers, and also on transverse sleepers. The disadvantage was want of vertical stiffness of the system; and, if the rail was made higher, it was liable to rock on the sleeper and work loose on the spikes. This rail, known as the Vignoles rail, has been much improved in form and proportions and is extensively used. The bridge rail (fig. 5)—so called

FIG. 4.—The flat-bottomed rail.

because it was first laid on bridges—was that first used on the Great Western Railway, and is of a shallow section, but wide, and possessed of lateral stiffness. The first line was a series of beech

piles, 12 inches square, driven into the ground, to which were bolted at the surface level cross balks of timber, one on each side of the pilehead on which they were shouldered. Longitudinal balks, 15 feet long, were laid on the cross balks. The longitudinals were covered with oak or elm planking screwed down to the surface. When the ballast was packed under the longitudinal balks, the surface of the oak planks was planed level, and the bridge rails screwed down on them, with felt between. It was supposed that there would be no yielding whatever, but a very short time demonstrated that the piles formed a series of solid resistances, while the balks between sprang, and it was found necessary to cut away the piles. Transoms were then framed into the longitudinals and secured by strap-bolts, and the whole resembled a long ladder laid on the ground. Eight different sections of rails were tried in succession; one section measured $1\frac{1}{2}$ inches in height by 7 inches in width, weighing 44 lb per yard; and the last section $2\frac{1}{4}$ inches high by 6 inches wide, weighing 62 lb per yard. The screws which held down the rails were counter-sunk beneath the wheel-flanges, and nut-headed on the other side (see fig. 6). In consequence of the want of depth in the rails, they bent

longitudinally under the wheels, and the horizontal flanges curled up at the sides, while the holes through them bent into angles. One remedy tried was to cross-board the longitudinal timbers on the surface, and thus the fibre was made less yielding.

The double-headed rail (fig. 7) was originated by Joseph Locke, and was first laid on the Grand Junction Railway. It also weighed 62 lb per yard. The two tables were equal; the rail was more easily rolled than others, and, being reversible, it was in fact two rails in one. But as it was laid in cast-iron chairs the lower table was exposed to damage under the hammering of the traffic; and many engineers were led to make the lower table of smaller size, as in fig. 8, merely as a support, not as a surface to be used by the wheels. This rail, which acquired the title of "bull-headed," was, like the flat-foot and bridge rails, used as a prop supported on its base. There was a waste of metal in these early rails, both flat-foot and double-headed, owing to the excessive thickness of the vertical web, which has been corrected in recent designs. It was found, naturally, that rails would not rest in their chairs at the joints, but were loosened and bruised at the ends by the blows of the traffic. The fish-joint was therefore devised in 1847 by Mr W. Bridges Adams, the intention being by "fishing" the joints to convert the rails into continuous beams. In the original design two chairs were placed, one under each rail, a few inches apart, as in fig. 9. The joint was thus suspended between the two chairs, and two keys of iron, called "fishes," fitting the side channels of the rails, were driven in on each side between the chairs and the rails. In subsequent modifications the fishes were, and they continue to be, bolted to and through the rails, the sleepers being placed further apart, and the joint suspended between them.

FIG. 7.—The double-headed rail.

FIG. 8.—The bull-headed rail (62 lb per yard).

for power. The year 1829 is famous in the annals of railways not only for the opening of the Liverpool and Man-

FIG. 9.—The original fish-joint, by W. Bridges Adams.

chester line but for the invention and construction of the first high-speed locomotive of the standard modern type. Robert Stephenson's engine, the "Rocket," was made under competition for the Liverpool and Manchester Railway, and it gained the prize for lightness, power, and speed awarded by the directors. The two steam-cylinders of the "Rocket" were 8 inches in diameter, with $16\frac{1}{2}$ inches of stroke, and the driving-wheels were 4 feet $8\frac{1}{2}$ inches in diameter. The engine weighed 4 tons 5 cwt., the tender following it 3 tons 4 cwt., and two loaded carriages drawn by it on the trial 9 tons 11 cwt.: thus the weight drawn was 12 tons 15 cwt., and the gross total 17 tons. The pressure of steam in the boiler was 50 lb per square inch. An average speed of 14 miles per hour was attained, the greatest velocity being 29 miles per hour; and the boiler evaporated $18\frac{1}{4}$ cubic feet, or 114 gallons, of water per hour. The "Rocket" possessed the three elements of efficiency of the modern locomotive,—the internal water-surrounded fire-box and the multitubular flue in the boiler, or a number of small tubes in place of one large tube; the blast-pipe, by which the waste steam of the engine was exhausted up the chimney; and the direct connexion of the two steam-cylinders, one on each side of the engine, with the driving or propelling wheels, on one axle. The subdivision of the single large flue, up to that time in general use in locomotives, into a number of small tubes greatly accelerated the generation of steam without adding to the size or weight of the boiler. But the evaporating tubes would have been of little avail practically had they not been supplemented by the blast-pipe, which, by ejecting the steam from the engine after it had done its work in the cylinder straight up the chimney, excited a strong draught through the boiler and caused a brisk and rapid combustion of fuel and generation of heat. The heat was absorbed with proportional rapidity through the newly applied heating-tubes. The blast-pipe, thus applied, in conjunction with the multitubular flue, vastly improved the capacity and usefulness of the locomotive. And, taking into account the direct connexion of the steam-cylinder with one axle and pair of wheels, the improvements were tantamount to a new and original machine. The "Rocket" subsequently drew an average gross load of 40 tons behind the tender at a speed of 13.3 miles per hour. The old Killingworth engine, one of the earlier type of locomotives constructed by George Stephenson, weighing with its tender 10 tons, could only work at a maximum of 6 miles per hour with 50 tons.

For many years engines belonged to two general classes. In one class there were six wheels, of which one pair was placed behind the boiler, typified in the engines of the day made by Robert Stephenson; in the other class there were but four wheels, placed under the barrel of the boiler, leaving the fire-box overhung, typified in the engines made by Bury for the London and Birmingham Railway. Experience demonstrated the disadvantage of an overhanging mass, with a very limited wheel-base, in the four-wheeled engine running at high speed; and now it is the general

practice to apply six wheels at least to all ordinary locomotive stock. The earliest four-wheeled locomotive constructed by Robert Stephenson and Co. as an article of regular manufacture weighed 9 tons in working order. The six-wheeled engines which followed weighed $11\frac{1}{2}$ tons. In the course of business locomotives of greater power and greater weight were constructed; and there are locomotives of the present time which weigh $47\frac{1}{2}$ tons in working order, and with the tender full of water and coal about 80 tons gross. There are other engines of special design with twelve wheels which weigh in working order, with fuel and water, 72 tons. The contrast is emphasized in the history of the old Garnkirk and Glasgow Railway, which was opened about the year 1829. The first engines of that line weighed from 8 to 9 tons. They had steam-cylinders 11 inches in diameter, and 4-foot wheels of cast-iron, with a working pressure in the boiler of 50 lb per square inch. The "Garnkirk" engine used to take a train of three carriages, together weighing 7 tons gross, at the average speed of 16 miles per hour between Glasgow and Gartsherrie. When the old line, 8 miles in length, was merged in the Caledonian Railway, now comprising a system of nearly 1000 miles in length, the power of the engines was greatly increased, and at this day (1885) there are express passenger engines working over the same ground having large cylinders of 17 or 18 inches in diameter, and wheels of 7 and 8 feet in diameter, weighing from 35 to 45 tons. These engines, with steam of 120 lb pressure per square inch, take a gross load of 90 tons at a speed of from 40 to 50 miles per hour.

STATISTICS.

Length
of lines
open.

Length of Railways in the United Kingdom.—The length of railways open for traffic at the end of the year 1854, twenty-five years after the opening of the Liverpool and Manchester Railway, was 8053 miles (of which nearly one-fourth was single line of way), costing about £35,500 per mile. In 1874 that mileage was doubled (16,449 miles, nearly one-half being only single line), costing about £37,000 per mile. According to the latest published return the length of railways open for traffic at the end of 1883 amounted to 18,681 miles, and the proportion of single line had decreased, being under 46 per cent. Whilst the mileage open was increased at the rate of 420 miles a year during the earlier period (1854-74), it was only increased by 248 miles a year during the later period (1874-83). But many miles of way in multiple have been laid for the working of traffic concentrated on main lines,—127 miles of triple line and 285 of quadruple. The largest share of multiple way belongs to the London and North-Western Railway Company, which owns 28 miles of triple way and no less than 114 of quadruple. The principal section of this railway, 80 miles in length, between London and Rugby, is entirely in quadruple,—two lines for goods and two for passenger traffic. Table I. shows the distribution of the 18,681 miles of railway open at the end of 1883:—

Country.	Double Line or more.		Single Line.		Total.
	Miles.	Per cent.	Miles.	Per cent.	
England and Wales	8,880	or 68.5	4,835	or 36.5	13,215
Scotland	1,147	„ 39	1,817	„ 61	2,964
Ireland	578	„ 28	1,924	„ 77	2,502
Total	10,105	„ 54	8,576	„ 46	18,681

The railways here represented were owned by 281 companies (206 in England and Wales, 31 in Scotland, and 44 in Ireland). But the whole property is worked by 123 companies.¹

The longest mileage of railway worked by one company is that of the Great Western Railway, which at the end of 1883 was 2268 miles. Next to this ranks the London and North-Western (1793), then the North-Eastern (1534), the Midland (1381), the North-British (1006), and the Caledonian (877). The three longest mileages in Ireland owned each by one company are those of the Great Northern (503), the Great Southern and Western (478), and the Midland Great Western (425). The four largest English companies, taken together, work nearly 7000 miles of railway,—more than half of the whole length of railways in England and Wales. The two leading lines in Scotland, taken together, work nearly 1900, or two-thirds of the whole length of railways in Scotland. In

¹ It would appear that less progress has been made in Ireland than in Great Britain in amalgamation and concentration of management.

Ireland the three leading lines, taken together, work 1400,—more than half of the whole length of railways in Ireland.

Capital Invested, Expenditure per Mile, &c.—The capital raised Capital for the construction of railways at the end of the year 1883 invested amounted to about £785,000,000, representing an expenditure of £42,000 per mile open. Some small portion of this cost belongs to lines in course of construction. The money has been raised in the following proportions:—

Ordinary share capital paid up	£293,437,106	or 37.4 per cent.
Guaranteed stock	94,672,823	„ 12.1 „
Preferential stock	200,888,198	„ 25.6 „
Loans	15,328,505	„ 1.9 „
Debenture stock	180,599,680	„ 23.0 „

Total (say £785,000,000).... £784,921,312 „ 100.0 „

In 1857 the ordinary stock was 57 per cent., as against 37.4 per cent. in 1883; and the guaranteed and preferential stock together were but one-third of the ordinary share capital, while in 1883 they equalled it. The English railway system, so far as capital is concerned, has become adjusted to the rule of having rather less than 40 per cent. of the capital in "open stock." In 1845-46 the dividends of railways appear to have reached a maximum. The precipitate influx of new lines during the four years from 1846 to 1850, contests before parliament, competition in various forms, and other causes then came in to depress dividends, and reduced the average proportion of net receipts in 1849 to 2.83 per cent. of the total capital and loans raised at that time. In 1857 the percentage of net receipts had risen again to 4.06 per cent. of the total capital and loans; and notwithstanding the accumulation of preference capital and loans, both taking precedence of ordinary capital, the available dividend on the latter increased from 1.88 per cent. to 3.6 per cent. Since that time the average dividend paid on ordinary capital has maintained its level at least, and it amounted for 1883 to 4.68 per cent. The average cost per mile open at the end of 1883, calculated on the amount of capital raised, with that for 1857 added for comparison, was as follows (Table II.):—

	Miles Open.	Capital.	Per Mile 1857.	Per Mile 1883.
England and Wales	13,215	650,945,834	£49,280	£39,270
Scotland	2,964	98,531,315	£33,240	£28,230
Ireland	2,502	85,444,163	£14,170	£15,660
	18,681	784,921,312	£42,020	£34,950

The marked increase in capital expenditure per mile is due to permanent improvements, station accommodation, reconstruction, and mile. multiplication of lines. Of the great cost of English railways, independently of the permanent improvements already noticed, part has been incurred in parliamentary warfare, while much of it is due to great and costly termini, and to the character of the earlier works of construction in England, where great expenditure was incurred for the sake of securing long levels and very easy gradients, until Joseph Locke made a new departure, and constructed the Grand Junction Railway on economic principles by following in great part the contour of the surface. For this line and the London and Birmingham line, for which Robert Stephenson was the engineer, Acts were passed in the same year (1833). The latter line was expensively laid out with tunnels, viaducts, and heavy cuttings and embankments, and cost in round numbers £53,600 per mile, as against £23,200 per mile for Locke's line. The cheaper line abounded in inclines of from 1 in 85 to 1 in 265, whilst the more expensive line was ruled by gradients not steeper than 1 in 330. Locke reckoned upon the sufficiency of the engine-power to take the trains up the inclines, and the famous Crewe engine was the outgrowth of the situation. The London and South-Western Railway, which cost £26,800 per mile, was laid out by Locke to a ruling gradient of 1 in 250. There are other instances of economical construction by the same engineer in the original Caledonian and Scottish Central Railways—now amalgamated—the former of which was made with long gradients of 1 in 75, 1 in 80, 1 in 100, and other steep slopes. Besides these there are other cheaply made railways in Scotland; but there is only one Scottish railway of the monumental class,—the Edinburgh and Glasgow, nearly dead level, with enormously expensive works. On the Metropolitan Railway system, 22 miles in length, upwards of £11,000,000 have been paid up, or about £500,000 per mile. The enormous cost of this line, as well as of the Metropolitan District system (18 miles long, costing £374,000 per mile) and the North London system (12 miles long, costing £325,000 per mile), is sufficiently explained by the place and conditions. The original London and Blackwall Railway, built, like the North London, for the most part on arches, cost £311,912 per mile. The original Birkenhead, Cheshire, and Lancashire Junction Railway, now vested in the neighbouring railway companies, cost upwards of £75,000 per mile, owing partly to the protracted contests in which it had been involved with the neighbouring railways, and partly to the costly works of construction joining the railway to the docks at Birkenhead. Of railways in England, the original Carlisle and Sillolth

Railway, 13 miles long, has the honour of standing at the foot of the list, having cost £6474 per mile. Of the Scottish lines the Caledonian system stands at the head of the list, costing £45,500 per mile. The North British system cost £33,000 per mile. At the foot of the list stood the original East of Fife line, 7 miles long, with a cost of £4351 per mile. But the cheapest lines of considerable length are the Forth and Clyde line, costing £5525 per mile, and the Peebles line, costing £5545 per mile. Both these lines have been taken into the North British system. In Ireland the Dublin and Kingstown Railway, 8 miles long, a suburban railway, cost £53,000 per mile. The original Limerick and Foynes line, costing £5282 per mile, is probably the cheapest piece of railway in the United Kingdom.

The proportions of expenditure on capital account cannot in the absence of data be exactly determined. The following may be accepted as an approximate analysis of the average cost of the railways, as it stood in 1871:—

	Per mile.	Per cent.
Law and parliamentary expenses	£2,000 or 5 1/2	
Land and compensation	7,000 „ 19 1/2	
Works of construction and stations complete	18,000 „ 50	
Locomotive and carrying stock	3,000 „ 8	
Interest on stock, discounts, bonuses, dividends from capital, contingencies, &c.	6,000 „ 17	
	36,000	100

From this estimate it would appear that the net cost of construction and equipment was £21,000 per mile, or about 58 per cent. of the entire cost. The capital cost of the working stock is given by the London and North-Western Railway Company. Excluding a considerable number of engines and carrying stock which had been constructed as duplicate stock—charged to revenue, no doubt—at 31st December 1884 the quantities and costs were as follows:—

2,323 locomotives	£3,574,284 (£1538 per engine).
1,647 tenders	
8,463 passenger carriages	1,496,212 (£268 per vehicle).
2,116 horse-boxes, guards' vans, &c.	
51,847 waggon stock	3,320,322 (£64 „).

Total £8,390,818

It is to be explained with reference to these low rates of cost that the original cost of the early working stock stands unaltered in the books of the company, whilst the whole of the original working stock has been replaced at the charge of revenue by engines and vehicles of modern design and larger capacity. Divided by the number of miles (1793) open at 31st December 1884, the total charge for working stock is at the rate of £4680 per mile open. For new working stock manufactured by the same company during the eighteen months ending 31st December 1884 the following average sums were charged to capital:—

31 locomotives with tenders or tank-engines	£1100 each.
229 vehicles, carriage stock	385 „
2192 vehicles, waggon stock	59 „

Working or Rolling Stock.—The working or rolling stock of railways consists of locomotives with their tenders, passenger carriages, horse-boxes, carriage trucks, travelling post-offices with their tenders and vans, goods waggons, covered goods waggons, cattle trucks, coke and coal waggons, timber trucks, ballast waggons, and goods brake vans. Table III. (below) shows that in England and Wales there is nearly one locomotive per mile of line open, or for the United Kingdom three engines for every 4 miles. The greatest waggon stock per mile open is to be found in Scotland—nearly thirty-one per mile. The proportions of vehicles for traffic of all classes for each locomotive averaged at the end of the year 1883:—

England and Wales	31.1 vehicles per engine.
Scotland	51.7 „ „
Ireland	24.6 „ „

Total 33.9 „ „

The excessive proportion of fifty-two vehicles per engine in Scotland corresponds to the comparatively excessive number of train miles with goods and minerals, which are 20 per cent. more than the passenger-train miles, whilst in England they are 8 per cent. less, and in Ireland more than 50 per cent. less. The various

proportions of rolling stock for twenty-one leading British railways (31st December 1883) are exhibited in detail in Table IV., arranged in the order of the numerical proportions which the carrying stock for traffic bears to the locomotive stock:—

Railway.	Miles open.	Locomotives.	Carriage Stock.	Waggon Stock.	Carriage and Waggon Stocks.			
	Miles.	Engines.	Vehicles.	Vehicles.	Vehicles.	Per engine.	Per mile open.

Here the number of vehicles varies from 5 per engine on the Metropolitan Railway, 7 on the District Railway, and 11.7 on the North London Railway—all of these specially passenger lines of dense traffic—to 54 per engine on the North-Eastern Railway, 59 on the North British Railway, and 65 on the Caledonian Railway—all these being specially lines of mineral traffic.

Train Miles Run, 1883.—The number of miles run by passenger Train and goods and mineral trains, and the number run by mixed trains, mile as follows (Table V.):—

Country.	Passenger.		Goods and Minerals.		Mixed.		Total.	
	Train Miles.	Per average mile open.	Train Miles.	Per average mile open.	Train Miles.	Per average mile open.	Train Miles.	Per average mile open.
England and Wales	117,406,242	8940	108,446,732	8258	498,415	38	226,351,389	17,236
Scotland	13,245,827	4486	15,938,637	6397	1,632,351	553	30,816,815	10,496
Ireland	7,526,871	3030	3,602,884	1450	605,777	246	11,735,532	4,726
Total	138,178,940	7442	127,983,253	6893	2,737,043	147	268,897,236	14,482
Total, per cent. ..	51.4	..	47.6	..	1.0	..	100	..

The mixed-train miles constitute just 1 per cent. of the total number, and the mileages run by passenger and goods trains are nearly equal. On an average each mile of way was traversed forty times a day. Taking the means of the numbers of engines for the end of 1882 and the end of 1883 as the average number during the year, the train miles run per locomotive are as follows (Table VI.):—

1883.	Average Number of Engines.	Train Miles per Engine.
England and Wales	11,996	18,863
Scotland	1,678	18,861
Ireland	626	18,747
Total	14,300	18,806

An engine when actually on duty may accomplish 120 train miles

per day, which would make upwards of 40,000 per annum. But at any moment half the engines may be taken as in reserve or under repair, which reduces the average performance per engine of the whole stock to some 20,000 miles per year, and the circumstances of many lines do not admit of such high averages of mileage run. Taking the twenty-one leading lines in detail, following the selection already made to show the quantities of working stock, the number of train miles run on the different lines in 1883 is shown in Table VII. as follows:—

Railway.	Average Miles Open.	Average Number of Locomotives.	Train Miles run.			Miles run per Engine.

Difference of engine miles and train miles	116,622	1,483,682
Difference per cent. of train miles	9.37	29.9
Fuel consumed—		
Coke	12,076.3 tons	—
Coal	11,484.0 „	117,679 tons
Per train mile run	42.4 lb	53.4 lb
„ engine mile run	33.8 lb	40.9 lb
„ hour in steam	304.5 lb	156.5 lb
Cost for fuel per train mile, at 6s. 5.43d. per ton	—	1.84d.
Cost for fuel per engine mile	—	1.41d.
„ per hour in steam	—	5.40d.

In general the lines of preponderating passenger-train miles run the greater number of miles per engine. The small mileage per engine of the London and North-Western line, with a relatively

small goods-train mileage, is partly explained by the fact that this company had 141 duplicate locomotives in 1883. Engines run many miles unavoidably “empty,”—that is, without a train, the proportion of the empty or unprofitable mileage depending on the traffic and the nature of the line. A line with locally heavy gradients must have “assistant” or “pilot” engines in readiness to assist the trains up the inclines, and such engines usually have to return empty to the depot; and in cases of special trains empty engines are run to or from the train, as the case may happen. Engines, especially assistant engines, may have to stand “in steam” or with the steam up and the fire in good order, in readiness to act when required. Some railway companies register the whole time the engines are in steam, also the assistant, ballasting, and empty mileage run, besides the time on active duty and the train miles run. The nature of the duty of goods engines, which is various, is also distinguished, so as, in short, to make a complete record of the work done. Thus for the Manchester, Sheffield, and Lincolnshire Railway Table VIII. (see above) gives the duties performed by the engines during the second half-years of 1887 and 1888. The times of engines assisting and running empty are included in the hours in steam with trains,—passenger and goods respectively. There were about 170 engines employed in shunting and marshalling trains. The relative percentages of the hours the engines were in steam and of miles run on different duties in the second half-year of 1888 are given in Table IX. —

Service.	Hours in Steam.	Miles run.
	Per cent.	Per cent.
Passenger trains	14.6	36.4
Goods and mineral trains	22.4	40.6
Passenger, goods, and mineral trains	37.0	77.0
Ballast trains	1.2	1.1
Shunting	36.8	17.4
Assisting	{ included in passenger, goods, and mineral trains }	.5
Empty		4.0
Standing	25.0	—
Total	100.0	100.0

The proportion of extra engine mileage to the work done in hauling goods, minerals, and passengers varies very much on different systems, according to the nature of the traffic, for by far the greater part of it arises in connexion with goods and minerals, which itself is a very varying quantity. The train mile, therefore,—that is, the revenue-producing train mile—though it is the simplest and handiest unit of performance, is not an absolute measure of work done. The shunting or marshalling of trains is an item not indicated by train mileage, and yet it is hard work and occupies as many hours in steam as the train mileage. Again, the fuel consumed, reckoned only on the train mileage run, amounts to 53 lb per mile run; but, reckoned on the total mileage run by engines, in which the extra mileage, whether ballasting, shunting, or assisting, is hard work, it amounts only to 41 lb per mile run.

On the London and North-Western Railway in 1874 the total shunting time was 613,472 hours of one engine—about the same as on the Sheffield line in 1883—and on this work 171 engines were constantly employed, marshalling and classifying the trains in the sidings. A like number, so employed on the Sheffield line, amount to one-third of the total locomotive stock.

Traffic.—Before the establishment of the railway from twenty Pass-to thirty coaches ran daily between Manchester and Liverpool, enger whereas the railway carried 700,000 passengers during its first traffic. eighteen months. Wherever railways were made the carriage of passengers was found to be one of the most remunerative sources of traffic. Nearly fifty years ago Porter, in his *Progress of the Nation* (1836), estimated that in Great Britain 82,000 persons daily, or 30,000,000 per annum, travelled by coach an average distance of about 12 miles each, at an average cost of 5s. for each passenger, or 5d. per mile, whereas in 1881 upwards of 600,000,000 passengers travelled by railway at a cost, taking averages, of 10½d. each, which at the average rate of say 1½d. per mile travelled would represent an average length of 8½ miles, at one-fourth of the cost and in one-third of the time required by coach.

Table X. shows the total number of passengers of each class conveyed in 1883:—

Country.	First Class.	Second Class.	Third Class and Parliamentary.	Total.
England and Wales	29,697,866	59,088,508	523,420,384	612,401,758
Scotland	4,790,982	2,835,687	44,404,858	52,031,527
Ireland	1,699,029	4,177,589	19,408,234	19,284,852
Total	36,387,877	66,096,784	581,233,476	683,718,137 ¹

The proportions of passengers, independent of season-ticket holders, were as follows (Table XI.):—

¹ Season-ticket holders in addition:—England and Wales, 570,686; Scotland, 37,924; Ireland, 23,440; total, 632,050.

Country.	First Class.	Second Class.	Third Class.	Totals.
	Per cent.	Per cent.	Per cent.	
England and Wales	4.9	9.7	85.4	100
Scotland	9.2	5.4	85.4	100
Ireland	8.8	21.6	69.6	100
Total	5.8	9.7	85.0	100

The number of passengers conveyed in the year 1883 per mile of the mean length of railway open during the year was, in England 46,340, in Scotland 17,550, and in Ireland 7710.

The receipts from passenger traffic in 1883 are given in Table XII. (see below). The decided preponderance of third-class traffic shown in this table is the outcome of the work of years. In 1854 upwards of 111 million passengers travelled by railway, of whom 13 per cent. travelled by first, 34 by second, and 53 by third class and parliamentary carriages. In 1873, the year before the Midland Railway Company ceased to carry second-class passengers, upwards of 455 million passengers travelled by railway, of whom only 8½ per cent. travelled by first, 15 by second, and 76½ by third class carriages. In 1881 upwards of 623 million passengers travelled by railway, nearly six times as many as in 1854. Of these only 6 per cent. were first and 10½ second class passengers, whilst the third-class and parliamentary passengers rose to 83½. Finally, in 1883 (as already stated in Table XI.), 85 per cent. of the passengers were third class. The same movement is exemplified in the receipts, the mass of receipts gravitating towards third class, as shown by the following abstract per mile open for the years already mentioned (Table XIII.) :—

Year.	First Class.	Second Class.	Third Class.
1854	£349	£416	£382
1873	274	250	787
1881	209	190	846
1883	196	178	913

These figures show that in 1854 first and second class receipts together made up two-thirds of the whole receipts from passengers, but that they steadily declined in succeeding years, not only proportionally but absolutely,—the third-class receipts, on the contrary, exhibiting a rapid increase, inasmuch that, whereas in 1854 they were exactly one-third of the whole receipts, in 1883 they amounted to more than two-thirds of the whole receipts from passengers. The reaction in first-class receipts is all the more remarkable because the number of first-class passengers in 1854—14½ millions—was nearly trebled in 1873; that of 1873 was almost exactly the same as in 1881,—about 38 millions; whilst in 1883 there were nearly 36½ millions. The explanation is probably to be sought partly in the fact that first-class fares have been reduced in many cases and express fares have been almost entirely abolished, and partly to the increased habit of taking third class for long journeys, so that first-class journeys, being shorter on the average, have become less remunerative to the companies than before. The third class is by far the most remunerative portion of the passenger traffic of railways; and it is difficult to understand the policy still pursued by railway companies in France, of discouraging third-class traffic. On those railways where fast trains do not take third-class passengers, or third-class carriages are deterrently uncomfortable and repulsive, only those travel who travel by necessity, or to whom money is no object. On the contrary, low fares and comfortable carriages invite traffic; they may almost be said to create it,—a fact which has long been recognized by the more intelligent of railway managers. The high speed of express trains—from 45 to 50 miles and upwards per hour—is, of course, an additional inducement to travel. On certain lines there are only two classes of carriages,—first and third. The Caledonian Railway Company was the first to adopt, about thirty-five years ago, the system of two classes only for local main-line passenger traffic. The Great North of Scotland Railway Company opened its line in 1854 with only first and third class carriages. The Midland Railway Company, as already noticed, ceased in 1874 to run second-

class carriages, at the same time readjusting and lowering the fares,—the revised rates being 1½d. and 1d. respectively per mile for first and third class. The result was that in 1875 27½ million passengers travelled on this railway,—nearly 5 millions more than in 1873, before the change was made; whilst in 1881 there were 29 million travellers, of whom 27 millions were third and only 2 millions first class passengers; and in 1883 upwards of 31 million passengers were carried, of whom 29½ millions were of the third and a little over 1½ millions of the first class. The gross receipts for passenger traffic on the Midland Railway were, in round numbers, £1,660,000 in 1873, £1,787,000 in 1881, and £1,904,000 in 1883, whilst the percentage of working expenditure remained the same. On the whole, it appears from the results of this grand experiment that the change has succeeded financially, whilst there is no doubt that it has stimulated the provision for and development of third-class travelling on other railways. The gravitation of traffic to the lowest level is unquestionable; and it is aided by the fact that third-class carriages have been (1885) for some years run with nearly all trains, fast as well as slow, and that the largeness of the number of third-class passengers has forced upon the management of the companies improvements in the popular class of carriage. As the downward movement of the classes continues the outcome will most likely be a general reduction of the number of classes to two,—nominally first and third, practically first and second. On 1st May 1885 second-class carriages were abolished on the branch lines of the Great Northern Railway; and, if the experiment answers expectations, second-class carriages will be abolished on the entire Great Northern system.

The returns to the Board of Trade do not supply material for Goods close analysis of goods traffic. The quantities of minerals and traffic goods or general merchandise conveyed in 1883 were as follows (Table XIV.) :—

Country.	Minerals.	General Merchandise.	Total.	Total per average mile open.
	Tons.	Tons.	Tons.	Tons.
England and Wales	160,522,029	65,387,854	225,909,883	17,100
Scotland	27,787,095	8,692,438	36,479,533	12,300
Ireland	1,196,438	2,817,569	4,014,007	1,600
Total	189,485,562	76,897,861	266,383,423	14,260

The receipts from mineral and goods traffic in 1883 are given in Table XV. :—

Country.	Merchandise.	Live Stock.	Minerals.	Total.
England and Wales	£18,028,587	£787,642	£14,057,188	£32,873,417
Scotland	2,267,685	175,996	2,062,223	4,505,899
Ireland	952,215	208,808	186,010	1,297,033
Total	£21,248,487	£1,172,446	£16,255,421	£38,701,319
Total per mile open	£1187	£63	£870	£2070
Proportion per cent. of total	55.0	3.0	42.0	100

These statistics of merchandise and mineral traffic show that upwards of 266 million tons were conveyed in 1883 in the United Kingdom, seven-tenths of which were minerals. In 1857 71 million tons were conveyed, of which only two-thirds consisted of minerals; whence it appears that a more rapid development of mineral traffic than of general merchandise took place in the interval.

The whole of the receipts directly earned on the railways in Receipts. 1883, with the miscellaneous receipts derived from rents, tolls, navigation, steamboats, &c., are brought together in Table XVI. (see below). The receipts per train mile from passengers and from goods and mineral traffic are reckoned exclusive of the receipts on railways working mixed trains; but all the receipts per train mile for passengers and goods together are divided by the total mileage run by all trains. In the last column the gross receipts, including miscellaneous receipts, are divided by the total train mileage.

¹ Including £24,965 from goods-traffic receipts not classified.

TABLE XII.—Receipts from Passenger Traffic in 1883.

Country.	Receipts from Passengers.					Language, Fares, Carriages, Horses, Dogs, &c.	Mails.	Gross Total.
